$5.45

THE ADAMS FURNITURE CO., Limited,

Canada's Largest Home Furnishers. TORONTO, ONT.

Prize Winners at the New Brunswick Provincial Seed Fair.

That it is unnecessary for New Brunswick farmers to go beyond the confines of their own province for seed grain was aptly demonstrated by the very creditable display that was made at Fredericton on February 23rd. Mr. S. J. Moore, Maritime Seed Inspector placed the awards. Those who take particular pains in cleaning their grain and growing only the best, find ready sale for their surplus stock at high prices, while those who do not give seed growing any special consideration find they must buy from their more up-to-date neighbors or send away to parties from whom they can get no guarantee that the grain will not contain impurities of an abnoxious character.

Following is a list of the awards:

WHEAT, WHITE FIFE—1, H. B. Parlee; 2. Donald Innes; 3, H. Gordon; 4, Robert Smith; 5, S, B. Hatheway.

WHEAT, RED FIFE—1, Donnald Innes; 2, George E. Fisher; 3, W. H. Moore; 4, John Stennick; 5, Henry Wilmot.

WHEAT, ANY OTHER VARIETY—1, W. E. Palmer; 2, Geo. E. Fisher; 3, W. McMurray.

OATS, BANNER—1, T. E. Goggin; 2, Donald Innes; 3, W. E. Palmer; 4, T. Hamilton; 5, Ed. Emmerson.

OATS, STORM KING—1, W. E. Palmer; 2, Geo. E. Fisher, 3, Robert Shaw; 4, Ed. Emerson, 5, N. F. Phillips

OATS, WHITE, ANY VARIETY—1, Donald Innes; 2, Geo. E. Fisher; 3, A. R. Snowball, 4, H. B. Parlee, 5; N. F. Phillips.

OATS, BLACK—1, H. B. Parlee.

BARLEY, TWO ROWED—1, H. B. Parlee; 2, D. Innes.

BARLEY, SIX ROWED—1, Donald Innes; 2, Robert Shaw 3, T. Hamilton.

BUCKWHEAT, SMOOTH—1, H. B. Parlee.

BUCKWHEAT ROUGH—1, Donald Innes; 2, H. B. Parlee, 3, T. Hamilton; 4, W. E. Palmer, 5, Robert Shaw.

FIELD PEAS, MARROWFAT—1, H. P. Parlee; 2, Donald Innes; 3, H. Gordon; 4, W. E. Palmer.

PEAS, ANY VARIETY—1, H. Gordon; 2, Donald Innes; 3, T. Hamilton; 4, W. E. Palmer.

BEANS, WHITE—1, Robert Smith.

BEANS, COLORED—1, Donald Innes; 2, Henry Wilmot.

CORN, ANY VARIETY, FLINT—1, Jas. W. Smith.

POTATOES, BEAUTY OF HEBRON—1, H. Gordon, EARLY ROSE 1, W. E. Palmer, 2, H. B. Parlee; 3, Jas. W. Smith, EARLY PURITAN—1, H. Gordon. IRISH COBBLER—1, H. B. Parlee. ANY OTHER VARIETY—1, H. B. Parlee; 2, Henry Wilmot; 3, C. H. Giles. CARMAN—1, H. D. Buchanan; 2, H. B. Parlee; 3, H. Gordon. GREEN MOUNTAINS—1, H. B. Parlee; 2, W. E. Palmer; 3, W. H. Moore; 4, J. P. Harding; 5, Jas. W. Smith. GOLDEN COIN—1, W. E. Palmer; 2, John Ferguson; 3, Lorne Hamilton, ANY OTHER LATE VARIETY, WHITE—1, W. E. Palmer; 2. Jas. Harding, 3, H. Gordon; 4, H. B. Parlee; 5, C. H. Giles, ANY OTHER VARIETY, RED—1, Jas. W Smith. DARK SKINNED—1, H. B. Parlee.

Maple Syrup and Sugar Makers.

(Continued from page 269)

the shingle mill and got them sawed into thin shingles. We then nailed cleats across the thick edge of the shingles which rests against the inside of the outer edge of the cans. The thin end of the shingle rests against the tree and in this way we have made for our cans covers at a trifling cost, that are almost ideal, compared with metal covers.

This mode of tapping is the best we know and is more generally followed than any other system. The sap is gathered with a horse and sled. The gathering tub is larger at the bottom than at the top and has a hinged cover. The tub may be tipped over and its contents spilled into the storage tanks.

We have an evaparator 16 feet long and 5 feet wide set on a portable furnace. The evaporator is in four sections two of which are 6 feet long. The other two sections are each two feet in length. The boiling sap passes from one compartment to another through syphons until it arrives in the last one from which it is drawn as syrup. Syphons are fitted with 1-2 cups at the bottom which does not allow any sediment to pass through with the exception of a substance which is a part of the product

HELP FOR WEAK, BROKEN DOWN MEN AND WOMEN

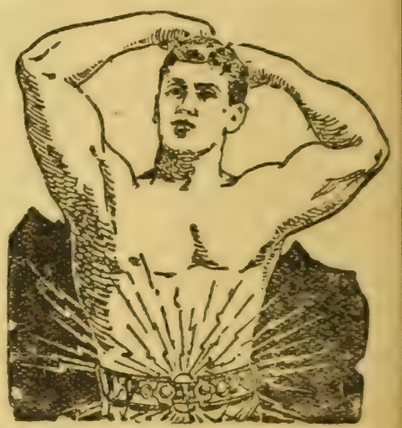
Worry--Worry--Worry! It's Not Work But Worry That Kills!

It's true that hard work has laid many a man on the shelf, but for every man who has been put out of commission by hard work hundreds have been sent to the scrap heap through some sort of dissipation or excesses.

Disease also has played its part in making the thousands of nervous and physical wrecks we encounter every day.

Never mind the cause; it's the condition that confronts us.

Give me a man who has lost his health and vigor through any cause, who lacks the strength and energy of a Manly Man, and I can restore his vitality, build up his strength and vigor, and give him back the energy and ambition of Youth! My Electric Belt is a Natural remedy, a time-tried remedy!



Its powerful current enters the body through cushioned electrodes, without shock, sting or burn, and, properly arranged for each case, its wonderful force is sent direct to any weakened organ, any weakened part of the system.

For hours at a time—in the daytime—in the evening, or, better still, during the night while you sleep, my Belt saturates your body with its wondrous vitalizing power.

I can prove to you that my Belt does all I claim for it. Is not the word of honest men and women who freely sent me their testimony good evidence?

Dear Sir, — I have used your Belt since last November, and I feel much better. The emissions have stopped entirely. I am well pleased with the Belt. It has proved all you claimed it to be.

DANIEL CHATTERTON,
Cobalt, Ont.

Dear Sir, — I have worn your Belt for a month now, and I am glad to say that I have received the greatest benefits from t. My back is a great deal stronger, and the pain in my legs and arms have gone and I am feeling like a new man already. You may use this letter in any way you wish. Wishing you every success, I remain,

WILLIAM McCONNELL,
Bon Accord, Vic. Co., N.B.

Dear Sir, — Since wearing your Belt, now three months, I am very pleased to tell you that my health has greatly improved. My back seldom hurts me now. I have gained flesh and look brighter and healthier than I have been for a very long time; and I can also sleep—oh, so well. For five years I can honestly say that I never knew what it was to have a proper night's rest, not until I wore your Belt, and I am confident that it can only be the Belt. To all persons suffering from Insomnia I most strongly recommend it—such a boon as it is. With my grateful thanks to you.

IDA E. MILLER,
King Edward Hotel, Elk Lake, Ont.

To those who are tired of paying without results, and to those who doubt if anything will help them, I make this offer. If you will secure me my

PAY WHEN YOU ARE CURED

I will let you have my Belt without paying me one cent in advance.

My Belt is the true cure for Indigestion (Dyspepsia), Constipation, Headache, Drowsiness, Rheumatism, Neuralgia, Lumbago, Sciatica, Weakness of the Back, Weakness of the Nervous System, Sleeplessness (Insomnia). It restores lost vitality. It corrects every sign of mental impairment and physical breakdown in men and women.

FREE BOOK

Call at my office and let me explain my Belt to you. If you can't do this, cut out this coupon, send me your name and address to-day, and I'll mail you, closely sealed, my elegantly illustrated 80-page book, which is FREE. My FREE BOOK for women is now ready. All men and women who are interested in recovering their health should read these books, for they point the way to Health and Happiness.

M. McLAUGHLIN,
214 St. James St., Montreal, Can.

but which can be eliminated when the syrup is strained. The sugaring-off process is conducted in a large pot outside the house. My son makes a large quantity of maple cream which finds a ready sale.

Before we bought our Grimm evaporator it was nothing uncommon for us to work nights and days for a week or more in order to get over a big run but now we do very little night work. We have started a fire at one o'clock p. m. and finished a run of 900 gallons before bed time. There is a lot of work in connection with maple sugar making but there is a certain glamour about it that is pleasing and one does not mind the hard work.

Maccan, N. S.

EWING'S

—the Seeds You Can Depend Upon

What's the use of having good land—of fertilizing it—of working it well—if you sow poor, old, half-dead seeds?

The best seeds—Ewing's—cost less than the land, the fertilizer or the work—but your crop depends on them. Saving cents on seeds means throwing away dollars in crops, for you cannot get good crops from inferior seeds.

Ewing's Seeds are strong—healthy—clean—reliable. They are not only sure to grow, but sure to grow good crops, if you give them a chance and weather conditions permit.

If you want to get the most out of your land, out of your work, out of your cash investment, get Ewing's Seeds. Don't accept substitutes. If your dealer hasn't Ewing's write us direct.

Send a post card for our big Illustrated Catalogue. It's free—and interesting.

Wm. Ewing & Co., Seedsmen, McGill St., Montreal.

Wanted

Live Men.

We want men of brains—with energy.

Men, who want to make good and increase their earning capacity, who are too ambitious to drag along day after day in inferior positions.

We want several men of this class as travelling representatives of the Maritime Farmer.

The Maritime Farmer is an easy seller because nearly every farmer in the Maritime Provinces wants it when he sees it.

To those capable of handling this proposition, we furnish with teams and pay a liberal salary.

If you think you are of the right material and have a capacity for work, write us.

We pay salary or commission. It all depends upon what you can do.

Each application will be dealt with as received.

Personal calls given priority.

The Maritime Farmer,
Sussex, N. B.

GOOD REPORTS

Home Mixed Stock Food a Success

A short time ago we published in this column a formula for preparing Stock Food at home from Barnes English Compound and fresh nutritious grains.

We have received so many words of praise for this formula that we are reprinting it for the benefit of those who may have chanced to miss it.

The advantage of making your stock food at home, using only the pure medicines and fresh grains, and avoiding harmful drugs and worthless fillers, is certainly of great importance to every farmer and stockman.

The formula is as follows: Mix three pounds of Linseed Meal and six pounds Cornmeal with one pound Barnes English Compound, it will make ten pounds purest and strongest stock food that can be made. S. G. Amsden, Windsor, Ont., will send one pound package postpaid on receipt of 50 cents, money order or stamps.

ITCHING ERUPTIONS QUICKLY CURED.

Just a few drops of the famous D. D. D. Prescription applied to the skin will take away instantly the worst kind of an itch. We positively know this.

Oil of wintergreen, a mild, soothing liquid, combined with such healing substances as thymol and glycerine, will penetrate to the inner skin, kill the germs, and heal. The D. D. D. Prescription, made at the D. D. D. Laboratories of Chicago, seems to be just the right compound, as thousands of remarkable cures prove.

Don't go on suffering from eczema or any other itching skin disease, when relief is so easily obtained.

Just write the D. D. D. Laboratories, Dept. F. M., 23 Jordan St. Toronto, and they will send you, free, a trial bottle. This sample will relieve the itching at once, and prove to your satisfaction that here at last is the cure for your torture.

Write for a trial bottle to-day.

For sale by all druggists.

N. B. Potatoes

I grow and have for sale large quantities of Potatoes. Seed varieties a speciality.

Geo. A. Fawcett, Middle Sackville, N B.

The PUBLISHER'S DESK.

I. C. R. PICTURES ARE SOUGHT FOR.—An enquiry recently received by the General Trafic Manager of the Intercolonial Railway, shows how wide is the distribution of a good item of news through the medium of the press. Last November an account of the display of I. C. R. views being shown on the New York Herald bulletin screens along with the returns of the Presidential election, went the rounds of the Canadian newspapers. It evidently traveled even further, for the other day a letter was received from Melbourne, Australia, enquiring about these views, and asking if they could be obtained for lecturing purposes. The views alluded to are beautifully colored steriopticon slides and the selection includes some of the prettiest scenic features along the line of the Intercolonial, such as "Quebec from Levis," "Bic," one of the most beautiful of the lower St. Lawrence seaside resorts, "Famed Matapedia Valley," "Baie des Chaleur," hunting and fishing scenes along the North Shore," "Bore at Moncton," "Reversing falls at St. John," "Wentworth Valley," "Folleigh Lake," "Halifax," and scenes on the "Bras d'Or Lakes." Wherever shown these have attracted great attention and have been widely admired.

BE READY TO CURE HORSE AILMENTS.—Because a farmer has to work with his horses and have their services nearly every day in the year, it is absolutely necessary that he be posted on their common ailments and know how to treat their injuries.

A horse owner should determine to be his own veterinary, at least in the ordinary cases. Little things happen too frequently to horses to be all the time depending on others. It is inconvenient as well as expensive to go for a horse doctor when a horse goes lame or there is a swelling to reduce or a wire cut to heal.

It is not out of place to suggest, as we have frequently done before, that it is wise to have such a thoroughly good and reliable horse remedy as Kendall's Spavin Cure constantly on hand.

Kendall's Spavin Cure is now and for a long series of years has been a standard horse remedy. It can hardly be too strongly recommended. Its compounder thoroughly understood horses and their diseases. He brought the ailment and the cure together and this applies not merely to one ailment but to most of the common troubles of the horse.

In this connection, we want to commend to our readers an excellent little book called "A Treatise on the Horse, and His disease." This book and Kendall's Spavin Cure ought always go together. The book is a wonderful little compendium of horse knowledge. It gives symptoms, describes diseases, suggests proper treatment. In very many cases Kendall's Spavin cure is the only remedy needed. The book can be had at the drug store where Kendall's Spavin Cure is sold or it may be secured by writing to the Dr. B. J. Kendall Company, at Enosburg Falls, Vermont, U. S. A., if you enclose a two cent stamp to pay postage.

RUBEROID COLORED ROOFING PATENT DECISION.—It is now unlawful to use any colored except by painting, "flexible waterproof prepared roofings" other than that made by the Standard Paint Company, New York. This is the sum of the decision, January 24th, 1910, by Judge Ray, of the U. S. Circuit Court. The decision, about 10,000 words, is such a minute examination of the history of materials and processes that it is near to being a treatise on the art of roof-making. The two patents on colored Ruberoid, dated November 22nd, 1904, cover both product and the process by which it is made. Both of these general claims are upheld with an enthusiasm born of exhaustive study.

"The process pointed out in the patent which varies from the prior art was successful. The prior art was not. All the constitutent elements of a product, a new article of manufacture, may be old, as of course these were, but this product as a complete article of manufacture was new, and it was better than any that had gone before. I think the evidence establishes that the first successful colored roofing upon the market was this colored Ruberoid made in accordance with the claims of the patents in suit. They are pleasing and attractive in appearance to those who desire a colored roof and who uses a roofing of this character. They are popular and have an extensve and increasing sale. It is shown that these roofings are durable and serviceable, and that the coloring is permanent."

This Colored roofing is also protected by patents in Canada by the Standard Paint Coy. of Canada Limited and manufactured by them at Montreal.

MAIL ORDER HOUSES COMBINE.—Montgomery, Ross & Co., and the National Cloak and Costume Co., two of Montreal's largest and best known Mail Order concerns, have lately joined forces. For the past few years both these houses have been doing a large business roughout the Dominion, and have earned names for themselves for honesty and fair dealing, that should go a long way towards insuring them success in their new venture. The new firm will be known as "Montgomery, Ross & Co., and the National Cloak and Costume Co amalgamated" and will carry on an exclusive Mail Order business on the lines of the great American houses. The men at the head of the concern have had a large and varied experience in the Mail Order business and have gone to work on lines that are bound to bring results. The growth of the Mail Order business in Canada in the past few years has been phenomenal and it is not hard to predict great things for the firms that get on the field early. Day by day, as the railway, telegraph and postal systems are extended, the people of this great land are brought closer together, and thanks to the progressive spirit of such firms as this, the rural population is able to easily obtain most of the luxuries of city life, as far as household and personal effects etc., are concerned. The very existence of our country depends greatly upon the rural population. So long as we can keep the young people on the farms there is no limit as to what we may achieve, and the best way to keep them at home is to make that home as attractive as possible. A few years ago this was a big undertaking, but the advent of the Mail Order home has changed things greatly. Countries as easily as if they lived in the city, stores, just as easily as if they lived in the city, and the guarantee of a reliable house is all that is necessary to insure them fair, honest treatment.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation, you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day as you may not see this offer again. Address:

CO-OPERATIVE DAIRYMAN.

Official Organ of The Farmers' and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association and The Maritime Bee-Keepers' Association.

Volume 15. Sussex, N. B., March 22, 1910. Number 12.

The Prince Edward Island Provincial Seed Fair.

Three in One---Seeds, Household Science and Poultry.

SUMMERSIDE, P. E. I., was quite a busy town on March 9th, 10th and 11th, for there the farmers of the Island province had congregated to attend the Provincial Seed Fair, where the various seed grain growers were viewing with each other for supremacy in their respective classes and, to listen to instructive addresses from agricultural experts and others who take a deep interest in the farmer's calling and discuss with them re matters of importance to Prince Edward Island agriculture.

Not to be outdone by the sterner sex, the good ladies of Prince Edward Island also congregated at Summerside and while the former made a display of seeds, the latter made a magnificent display along household science lines and held a ladies convention, where much practical discussion took place and where interesting addresses on matters pertaining to home life were given.

Officers of New Brunswick Farmers' and Dairymen's Association for 1910.

Top row, from left to right—Alex. F. Johnstone, St. John; J. R. Oastler, St. Andrews; S. L. Peters, Queentown; Hon. C. H. LeBillois, Dalhouise; B. R. Violette, St. Leonards; J. E. Long, Long Settlement

Middle row—Chas. Peters, Elmhurst; H. H. Smith, Treasurer, Hoyt Station; Geo. E. Fisher, Cor. Sec'y., Chatham; S. B. Hatheway, President, Fredericton; Bliss M. Fawcett, Rec. Sec'y, Sackville; John Moody, Bathurst; W. H. Moore, Scotch Lake.

Lower row—Isaac Baird, Chipman; S. B. Wright, Hillandale.

Prince Edward Island's most progressive poultrymen also made a showing of their feathered friends, that was most creditable. Despite the fact that no prizes were offered, some of the very best and most valuable birds, owned in the Island province, were shown, and did a double credit to their owners for thus assisting to make the farmers' convention as interesting and instructive as possible and will, undoubtedly, be the means of interesting not a few of those present in the culture of more and better poultry.

AT THE SEED FAIR.

The seed fair was held in Thomas Andrew's warerooms. Rev. Dr. Gauthier, the President of the Association; L. U. Fowler, the Secretary, and their staff of assistants, did their utmost to make the fair arrangements work smoothly and well and bring into prominence the object for which the fair was intended. Despite the large number of exhibits, there was ample room to display the grain, potatoes and other seeds to the very best possible advantage.

The quality of the grain was of a high order and of better color than one would expect, after the heavy rains that were encountered during the harvesting season. The percentage of discolored grains was very low.

COMPARATIVE NUMBER OF EXHIBITS IN

	1909.	1910.
Wheat	49	60
Oats	103	101
Barley and Buckwheat	51	39
Beans, Peas and Fax	26	21
Timothy and Clover	42	37
Corn and Other Seeds	29	36
Potatoes	206	147
Weeds and Weed Seeds	13	14

From the table below, it will be noticed that there was a gain in number of exhibits in the classes for wheat, corn and other seeds and in collections of weeds and weed seeds, and a slight loss in the other classes. The greatest falling in number of exhibits was seen in the potato classes, but the exhibits showed more care in selection re type, point of quality and freedom from disease and other blemishes which shows that farmers are paying more attention to specializing in varieties that have proved the most satisfactory and are discarding worthless varieties.

THE JUDGES.

Mr. S. J. Moore, Maritime representative of the Seed Division, Ottawa, had charge of the judging and personally judged the small seed classes. Mr. R. Robertson, Superintendent of the Experimental Farm at Nappan, N. S., judged the potato classes. Mr. Donald Innis, the veteran seed grower of Tobique River, N. B., and winner of the Steel Briggs' silver cup for the best exhibit of seeds for three consecutive years at the Maritime Winter Fair, Amherst, placed the awards in the wheat sections. Mr. J. Artemus Clark, Superintendent of the Prince Edward Island Experimental Farm, placed the awards in the oat classes. A full list of awards will be found on other pages of this issue.

IN THE HOUSEHOLD SCIENCE DEPANTMENT.

The household science department was conducted in the McNeill building, which was thronged with women and men of all ages, who admired the tastefnl display of the many tempting viands, which the intelligent wives and daughters of the Island province had entered for competition. The total number of entries was 607, as compared with 445 entries in 1909, and goes to show that the ladies are taking an active interest in all matters relating to the science of the home.

IN THE POULTRY DEPARTMENT.

The poultry department contained many prize-winning birds from the yards of some of Prince Edward Island's most foremost poultrymen. There was scarcely a poor bird in the number. As there were no prizes offered, the official fakirs remained at home and it was left to honest breeders to show what good poultry looks like and it was indeed a relief to see such a creditable show, without the admixture of inferior birds or any evidence of fakirism. Those professional exhibitors, who beg and borrow birds for special occasions, did not think it worth while to go to any trouble in educating along poultry lines. Why should they? They have no birds or eggs for sale. All they want is the money that exhibition associations offer and which rightly belongs to those who are honest beeders, who are striving to create a healthy interest in poultry culture.

Among those who exhibited poultry at Summerside were: John Rogers, Capt. John L. Read, Geo. Leightizer, J. H. Pritchard, Frank A. Johnstone,

Arthur Allen, L. H. D. Foster, Arthur R. Boats, Jarvis P. Tanton, Dr. Alex. McNeil, Frank Glydon and Alfred Groom. These gentlemen have good birds, they can supply birds and eggs in season, they have a reputation to maintain and they are not loath to go to some expense in furthering a general interest in poultry keeping.

THE AGRICULTURAL MEETINGS.

The first in the series of Agricultural meetings was held in Market Hall with Mr. Joseph Taylor, Freeton in the chair. The hall was packed to the doors.

AGRICULTURAL EDUCATION.

By Mr. Garnet LeLacheur, principal of the Hillsboro Consolidated School was the first subject on the programme. Mr. LeLacheur gave an interesting account of his own early education on the farm, at the Guelph, McDonald and Truro Agricultural Colleges. His experience and observations impressed him with the fact that the farmer must be a man of more brains than brawn, and he must make his home surroundings as attractive and convenient as possible. He outlined the growth of the educational movement from its earliest stages up to the present time. He expressed the opinion that some of the time spent in studying foreign languages in our schools and colleges might be better employed in the study of some other subjects of more importance. He had made a mark of 97 points in his Greek examinations when leaving the Prince of Wales College in 1903 but had not had occasion to use it ever since. He considered that the study of physiology and kindred subjects would have been time better employed as on the foundation of logic and physiology is built our modern sciences. Foreign languages were not necessary for mental gymnastics but had their place as a source from which many of our English words are derived.

Present day education should be shaped so as to train the student for life work along industrial lines and made to conform to the conditions of the great majority of boys and girls who must, of necessity leave school at an early age. Industrial schools were established at McGill College and in Halifax; the farmers industrial school was the Truro Agricultural College. The change to a more industrial system of education was slowly but surely coming. He thought Prince Edward Island farmers earned their money too easily and did not look to the future as seriously as they might. Agricultural Colleges were opening up and training along new avenues of thought, but very often, details worked out by experts in other provinces might not be suitable for Prince Edward Island conditions but all feasible ideas should be put in practice. All other professions were so dependent on the farmer's success es that they wese willing to help in the onward march of progress in the basic industry of agriculture.

Detriments to progress, such as insects and fungus pests, undrained lands, etc., were common and in order to be mastered one must make a thorough study of them.

When all countries that possess an agricultural college are clamouring for more financial assistance to help extend their work how could the farmers of Prince Edward Island be true to their profession if they, for a moment, entertained any prejudice against an agriculturial college or the thought that is being disseminated therefrom. Each and every Island farmer should be deeply interested in the Short Courses at Truro Agricultural Collage. Agricultural Societies were important factors in Agricultural education by means of the various kinds of work which are being conducted by such societies. Exhibitions, in order to be of the most benifit to farmers should be carried on along strictly agricultural lines and less attention paid to fast horses and acrobatic performances. Farmers' institutes were formerly conducted by college professors until the demand for meetings became so heavy that they could not cater to all and consequently some of our most progressive, practical farmers had stepped in to help carry and distribute the light.

Farmers Clubs were also prominent factors in forwarding educational movements and the speaker strongly urged the farmers in their respective communities to band together for co-operation in their common cause. Then they could be the power behind the throne and the powers that be must listen to their call.

Science and common sense must go hand in hand and every farmer should take one or more agricultural papers and all the bulletins he can get and study them closely which would give him better results than spend too much time, as is often done, in talking politics. It was a lamentable fact that teachers were so poorly paid that they were ready to step into some other profession that gave more promise of advancement. If present conditions continue it would not be long before all our schools would be in the hands of ladies. He was glad to note that the farmers were beginning to clamor for the teaching of agriculture in the public schools. The McDonald movement was closely associated with the idea and has done an inestimable amount of good. The speaker was opposed to teaching agriculture in the Normal School and in Prince of Wales College because they have not the equipment but the underlying sciences of agriculture should receive special attention. He considered the farmers of P. E. Island should call for more agricultural experts in their department of agriculture as it was too manifold a job as at present conducted for one man to look after. Many of the smallest schools throughout the Island might be consolidated into larger and better schools where more efficient work could be conducted. It would cost more to maintain such schools but it would be a paying proposition. To many of the brighter boys and girls of the Island were leaving for other countries and too many of the inferior ones were consequently left behind. To this fact he attributed the deterioration that causes so many unfortunates to domiciled at the Falconwood asylum.

By following proper systems of farming, our boys and girls too would have pleasant and profitable and profitable employment at home. Nova Scotia would soon be the Scotland of Canada in industrial lines and with such excellent markets wieasy reach why should not Prince Edward Island be the garden of Canada? The transportation problem was a serious one for Prince Edward Island but so many different opinions had been voiced that it was a difficult matter to settle on the solution. Then there was too much cussedness on the part of people who shipped produce containing too many varieties and too many grades which was responsible for low prices and for which the just suffered as well as the unjust.

Reform could not come altogether through our legislators; we must assist them and we must also place at the head of our affairs men who are men in every sense of the word, and who have our common interest at heart.

There were three ways by which a nation could obtain wealth viz:By war which involved robbery. By commerce which involved cheating and by agriculture, the honest farmer's trade. Our educational system should be taken out of political grasp. People, as a rule, were too prone to lavish expenses on their churches in which they spent a short time only one day in the week and neglected the beautifying of their school houses where their children spend the greater part of the week. This was a serious mistake as was the frequent changing of school teachers. He put forth a strong plea for more loyal support to the Truro Agricultural College and trusted the day was not far distant in the future when it would receive the support that would entitle it to the name "The Maritime Agricultural College."

DISCUSSION.

The discussion that followed Mr. LeLacheur's address was led by Inspector Wilfred Boulter of Prince County, who emphasized the fact that rural school education should conform more with the needs of the boys and girls who leave school at an early age. For these, education should be made as practical as possible and should have a direct bearing on life and home. There was very little agricultural teachings taught in Prince County, but Latin was being studied with great vim. Present systems of edueation educated our boys away from the farm instead of fostering in them a love for the farm. Were the young men of Prince Edward Island given a proper chance? Were they encouraged to remain on the farms or was it a case of all work and no wages or play? The farmers, by their unanimous banding together had succeeded in controlling the running of automobiles on Prince Edward Island. Why not band together in a demand for a system of education that will be of the highest importance to the boys and girls in our rural schools? A system of education sutiable for a town or city school may not be a satisfactory system for rural schools. Education should mean more than maintaining schools and sending pupils to the Prince of Wales college. While a great many of the present day teachers are not very well versed in agricultural matters they can, nevertheless, create a healthy interest in the subject. School gardens can be made more effective in demonstrating the underlying principles of the science of agriculture. Parents can do much to encourage the boys and girls by giving them a plot of land and some seeds with which to conduct experiments on their own farms. The practical work will appeal to our boys and girls much more strongly than the theoretical. Behind all movements for the necessary reform in our system of education must stand an intelligent public sentiment. He did not think Prince Edward Island Schools were declining but they were suffering from an arrested development which must be speedily remedied. The amount of money spent in sending young men to the Truro Agricultural College could not be spent to better advantage in any other line.

THERE IS NOTHING MORE EXPENSIVE THAN IGNORANCE

said Prof. Theodore Ross in following up the subject of agricultural education. Ignorance and dishonesty were ruining the Island seed trade. The boys who had attended the Short Courses had been highly benefited by the lessons received and a great many of them were now working along more modern lines.

MR. PETER BRODIE,

one of the Shourt Course students for several years had become imbued with the necessity for seed selection, spraying and treatment for smut and scab. He thought the Island legislature should have a greater representation of farmers in its ranks. It contained too many professional men at present. In concluding he put forth a plea for a central Institute, for the whole Island, which would be patterned after the Nova Scotia Farmers' Assocaation, where delegates from the various institutes scattered all over the province could meet and frame resolutions that would assist our legislators in directing the agricultural interests of the province by letting them know what the farmers wished them to do.

REV. DR. GAUTHIER

thought our schools must be declining if they were not going ahead and the former was too liable to be the case as a great many of the best teachers were taking up some other avocations that promised greater remuneration. Prince Edward Island farmers were at present assisting rich men's sons to get an education at the rate of $50 each year per student. How many of them remain at home to better their province after they get their education? As a rule, they went abroad and while he was proud to say Islanders were acquiring fame in distant lands he believed there could be a retrenchment made that would give the boys who would stay on the farms to forward Prince Edward Island a better chance, by awarding Scholarships at the Truro Agricultural Collage, and rich men's sons could pay their own way to fit them for their coverted fame that would benefit other lands but do very little towards upbuilding their own province. He concluded his discussion by saying that "until you spend as much on your farm boys as you do for boys who are to follow other professions you will never reach the ideal as 'Garden of Canada' yea, of America."

OBSERVATION OF AGRICULTURAL METHODS IN DENMARK AND OTHER EUROPEAN COUNTRIES

was the theme of an interesting talk by Mr. J. E. Sinclair who had been a visitor to European countries last fall as one of the Commission who went there to glean ideas that might be applied to Canadian conditions, particularly along the line of pork production. He related the methods that were followed re breeding, feeding, slaughtering and marketing of hogs in Denmark. Co-operation seemed to be the keynote in all these operations. The various interests were safeguarded against fraudulent practices and Danish products in the bacon, dairy and poultry lines were very much in favor wherever they were introduced as the description on the package was, as a rule, a true statement re the contents of the package.

POULTRY RAISING.

On Wednesday evening in St. Paul's Hall, Prof. J. P. Landry, of Truro, addressed a large audience. The hall was crowded to the doors. He gave a half-hour talk on poultry culture in which he set forth the underlying principles of success in the industry. Improvement by selection must be followed in the poultry lines as well as in all other lines of live stock if one wishes to succeed. Good stock good feed and comfortable quarters were the main essentiafs. In reply to the question, "which is the best breed?" he replied that strain was more important than breed. Some strains of the same breed were better than others. One had to settle the breed question according to his own fancy and local conditions. While trap nests would not be extensively used by farmers, every breeder should use them in establishing heavy laying strains from which future breeders could be obtained. Feed should be as near like that which the fowls pick up in summer as possible. Comfortable housing did not necessarily involve expensive buildings. Plenty of fresh air, cleanliness, sunlight and freedom from drafts and vermin were the most important considerations to

be observed in planning a poultry house. He then illustrated, on the screen, by means of lantern slides, several diseased conditions in poultry, desirable and undesirable qualities of birds were contrasted, modern methods of hatching, brooding and rearing of chicks as well as various types of desirable and cheap poultry houses and views of several large poultry establishments he had personally visited. The interested audience closely watched while they profited by the explanations and remarks he made re the different pictures until the series was completed at a late hour.

So interested were some of the Charlottetown delegates that they made arrangements with Mr. Landry to repeat his lecture at Charlottetown on Friday night.

HUMUS AND ITS IMPORTANCE IN MARITIME AGRICULTURE

was the theme of an interesting and instructive address by Prof. M. Cumming, of Truro when the farmers had convened in Market Hall on Thursday morning. This excellent address will be published in our first issue in April. At the close of the address an interesting discussion on the care of manures took place until the noon hour when the delegates returned to their respective hotels and boarding houses feeling that they had spent the morning hours profitably and well.

ON THURSDAY AFTERNOON.

Hon. John Richards, Commissioner for Agriculture acted as chairman and a large and appreciative audience listened attentively to an interesting address on subjects of vital importance to Prince Edward Islanders, by Mr. Deedmeyer, American Consul at Charlottetown. Mr. Deedmeyer has the interests of the Island Province deeply at heart as is shown by the interest he has taken in investigating its resources. In concluding his address in which he eulogized the products of Prince Edward Island he set forth a strong plea for more intensive farming and giving attention to the selection of good stock and seeds and working together for higher intellectual benefits.

A standing vote of thanks moved by Rev. Dr. Gauthier and seconded by Mr. Matheson M. P. P. was tendered to Mr. Deedmeyer for his kindly interest in agriculture matters.

AGRICULTURAL EDUCATION

Prof. Cumming was then called on to say a few words re agricultural education. The giving of an agricultural education to our boys was a sound proposition. While some farmers who had never attended college had made a decided success of their business; they would have enhanced these successes if they had had the advantages of a college training. A college training will not make a man practical but the education acquired there will help to direct practice along the most approved paths.

Science without practice was helpless. Farmers, as a rule, were not true to their profession; they should do more to create a sentiment towards their calling. He was glad to welcome Island Students to the college and would continue to do so.

Mr. J. A. MacLean, of Lot 16, as one of the students at the short courses expressed his appreciation of the work that is being done there and of the benefits he himself had acquired from his attendance.

GRADING SEED GRAIN.

The question of grading seed grain was then discussed and various standards of excellence were proposed. Finally it was resolved that the government be asked to enact that all oats sold to go out of the Province be classed under either one of the folfowing grades whose requirements are as follows;

No. 1. True to name. Not more than 20 foreign grains to the bushel . 95 per cent germinable. Not less than 34 lbs. per bushel and free from all noxious weed seed.

No. 2. True to name. Not more than 10 foreign grains to the pound. 90 per cent germinable. Not less than 34 lbs. per bushel and free from we(d seeds mentioned in the Seed Control Act,

No. 3. All classes of oats that do not conform, to either No.1 or No. 2 standards.

ON THURSDAY EVENING.

Rev. Dr. Gauthier, president of the association, acted as chairman. He said another page had been added to the annals of the seed fair and on it was incribed success. This success was due to the kind encouragement of the government and the good people of Summerside, backed up by the hearty co-operation of the farmers.

In point of quality the present seed fair had excelled all previous fairs and the household science department had excelled both in quantity and quality. Since the last seed fair many important matters of interest to farm life in Prince Edward Island had transpired. An Agricultural experiment station had been founded near Charlottetown and a general interest in agricultural education was being aroused. He liked to see matters of this kind come gradually for he believed they would be more lasting if they came through the process of evolution than if they came by revolution. Referring to the consolidated school movement, he said that like temperance the public must be gruadually educated re its importance. If we are to be fair to our children we must give them the very best education that will fit them their future callings and instead of paying good teachers meagre salaries they should be so well paid that they would not look upon teaching as a stepping stone to some other profession but would abide in the teaching ranks. Farmers, as a rule, were too prone to laud the successes of our Island boys and girls who acquire fame in distant lands and to say little or nothing of the bone and sinew that make successful careers at home. The consequence is that at an early age the eyes of our youths are cast towards distant fields of action.

An agricultural college was badly needed and as it was not advisable to have small ineffecient institutions for the respective provinces he believed Prince Edward Island and New Brunswick should join with Nova Scotia in maintaining and promoting one large efficient college.

Farmers' Institutes in various sections of the Island were doing excellent work and in order to be still more effective as guiding powers in agriculture he would like to see a central institute formed were farmer delegates form the various institutes could meet once a year and discuss questions of common interest.

He was pleased the ladies of his province were becoming interested in Womens' Institutes and he trusted that ere long a superintendent of Womens' Institutes would be available who would go throughout the

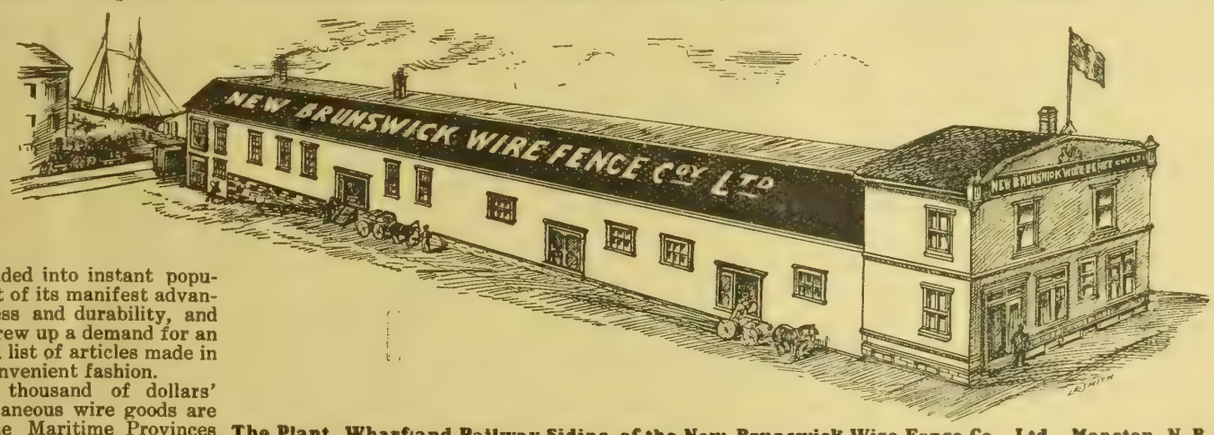
(Continued on page 333.)

The New Brunswick Wire Fence Company, Ltd., Moncton, N. B.

It is within the memory of the present generation when wire fencing, wire baskets and numerous other articles of wire manufacture entered into widespread use, and the corresponding displacement of wood, tin and iron that ensued. Some innovations require years of patent advertising to overcome the habits and prejudices of established customs, but the marvelous inventions and discoveries of modern times have accustomed the world to expect constant improvements in metals and mechanics, and wire work bounded into instant popularity on account of its manifest advantages in lightness and durability, and there speedily grew up a demand for an almost unlimited list of articles made in this light and convenient fashion.

Hundreds of thousand of dollars' worth of miscellaneous wire goods are consumed in the Maritime Provinces annually. Wire fencing stretches for miles through the country on every hand. It surrounds beautiful private and public gardens in cities, towns and villages. It encloses hundreds of prosperous farms in New Brunswick, Nova Scotia and Prince Edward Island. There is probably not a household or public building in the thirty-six Maritime counties which does not contain several wire articles.

But it is probably not known by many people that the only manufacturers of wire fencing in the Maritime Provinces are the New Brunswick Wire Fence Co., Ltd., situated in the central Maritime city of Moncton, the railway hub of the provinces, and the point to which thousands of sight seers bend their steps to see the bore of that famous tidal wave over, the Petitcodiac.



The Plant, Wharf and Railway Siding of the New Brunswick Wire Fence Co., Ltd., Moncton, N. B.

A wharf forms part of the premises of the New Brunswick Wire Fence Co., Ltd., but when you consider that several thousand tons of wire and other raw material is received by rail and practically the same quantity and weight of finished articles is in turn shipped to all parts of the provinces, you will realize that Moncton possesses unique advantages in the various railway lines that converge in that city and provide its merchants and shippers with rail facilities surpassing any other eastern community.

The New Brunswick Wire Fence Co., Ltd., started business in 1901 with moderate capital and faced many difficulties, which have been overcome by careful management and good business methods, with the result that orders have multiplied to such an extent that the works have undergone extensive additions with a view to enlarging the output to three times former dimensions.

The two-storied building, extending a block's length on Main street, on the corner of King, is the home of this vigorous enterprise. In this lengthy building the floor area equals three acres and the peculiarly constructed machines for manufacturing various parts of the products will immediately engage the attention of a visitor. An insignificant mechanical contrivance in one corner, weighing less than one hundred pounds, manufacturers twelve hundred staples per minute. Further on a noticeable giant machine, when in operation, is capable of finishing four thousand rods of completely made fencing a year. So it is from room to room. Everything is of modern design for expeditious manufacturing and for uniform efficiency of standard production. In stores and warerooms at the rear are found quantities of raw material, fences, gates, etc., convenient for delivery to or from freight cars on the company's siding or schooner at the company's wharf. In this way, during last year, one thousand tons of wire, including fifty car loads of raw material arrived, and now finely made, it stretches all over the Maritime Provinces and adorns many homes.

During the milder seasons there are one hundred and fifty men engaged in the shops and on outside contracts. All machinery is driven by electric motor. An enumeration of the company's products includes woven wire fences, coil spring fence wire, plain and ornamental fencing and gates, staples, fence tools, wire window guards, wire barrel covers, wall racks, waste baskets, flower bed guards, trellis guards. Orders for making any and all kinds of wire articles are given prompt attention. Shipments are addressed to all parts of the provinces and as far west as Montreal.

Three travellers cover this territory. The officers of the company are Dr. C A. Murray. President; A. C. Chapman, Secretary and Manager. The foregoing and Messrs, J. T. Hawke, Hon. C. W. Robinson and E. W. Given are the directors.

The Secretary and Manager, Mr. Chapman, is the active mind in development of the business of the New Brunswick Wire Fence Co., Ltd. This prosperous institution is not the out-come of any supernatural or magical power, which the founders and managers were able to control. There is no royal road to success and fortune in manufacturing any more than in any other occupation. Nor, generally speaking, is one country a better situation than another. Local circumstances do vary, but there are certain indispensible stepping stones to business achievement, which have been mentioned at the inception of this sketch, and these must always be present. The success of the New Brunswick Wire Fence Co., Ltd , is a particularly instructive lesson Why? Because if a company can be incorporated to supply one line of manufactured goods, which was previously imported, and in a few years can develop a large business in the face of organized competition, the question naturally arises, what is there to prevent numberless other manufacturers being established to cater to other wants of the home market ? There is no good reason, the more the merrier.

THE MARITIME FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmer of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association.

Subscription Price **$1.00** per year. **When paid in advance 80 cts.** Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for dis. continuance is given.

The date after your name on the little green label on front Page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—**"I saw your adv. in the MARITIME FARMER."**

THE FARM AND THE SCHOOL.

That our rural schools are not training the boys and girls of the farm for the duties and responsibilities of farm life, is a fact too well known to need repetition. With all of our boast and splendid advancement, the fact cannot be ignored that our country schools are inefficient. They are not meeting the great demand of the agricultural classes.

One of the principal reasons why our country schools are not better is the lack of interest shown by those who till the soil. We have been accustomed to leave the education of our children entirely in the hands of the teacher. We have been too unconcerned about the welfare of those upon whom the destiny of this country must rest.

Without the interest and co-operation of the community it is impossible to have a good school. The teacher, like any other individual, is largely a creature of enviroment. His enthusiasm for and interest in the farm will depend upon the support given by those who live on the farm. There is need of utility, harmony and co-operation between the school and the farm.

While the laws of most states require teaching of elementary agriculture in the public schools, few have met this requirement, Teachers are not prepared, facilities have not been provided and the people have not urged it. It is, then the duty of every patron and school officer to assist the teachers in this great work. Parents should urge, directors should insist that practical courses be given in agriculture. Not only should your request be made, but your help should be given.

Many of our most successful teachers are women. They are for the most part, competent and enthusiastic for the cause of education. They would willingly undertake this work if facilities were placed at their hands. The school garden especially appeals to most teachers. Here is where the help of the farm is useful. If land is not available on the school ground, a garden and experiment grounds should be furnished from the nearest farm. Teams and the necessary implements should be placed at the disposal of the teacher. The best seed and fertilizer should be donated. The entire community should take a part in this important work.

The progress of this study would be greatly accelerated if contests among the students were open and suitable prizes given for worthy products. These exhibits would arouse more enthusiasm and result in more interest in farming than any other frctor. The best of speakers could be secured and a farm and school institute held. This would be the beginning of a general awakening for agriculture in the public school. It would unite the public and school and give your boy and girl an inspiration for farm life.

From the public school should come inspiration for farm life, from it should radiate sentiment that will increase the products of the farm, instill a desire for education and endear the children to its enviroment. The farm must help the school to this.

THE BANK OF SOIL FERTILITY.

Think of it ! Some parts of this country have been so exhausted by continuous cropping without putting any fertilizer bank that where the soil ought to contain, and does contain on lands that have not been thus robbed, .4 per cent of nitrogen, it in reality holds not more than from .2 to .3 of one per cent ! What a story it is ! How ashamed we ought to be that we have dealt this way with our richest resources !

The man who does a little banking business watches his accounts wonderfully close. The law says he must. If he issues a check on the bank when there is no money to his credit to meet it, the law says he is a criminal and must be punished for it. So it stands him in hand to be very careful how he overdraws his account.

But with the farm bank of soil fertility we go on year after year taking out, taking out and never putting anything worth while back again. It is so wasteful ! Not only that, it is slow suicide. Still worse, it is stealing from our boys and girls, our friends and neighbors, who will occupy these lands after we are done with them.

Not only the nitrogen goes, but other essential elements that go to produce crops. These are not simply permissible elements ; they must be in the soil or we are undone. This is why so many farmers all over the country today are almost flat on their backs because they cannot get any crops worth while. And it is going to be worse instead of better, unless we wake up to the importance of keeping up our farm bank of deposits. Many sections of the country have been under the harrow for many generations. Naturally, they were good, rich lands, but now look at them ! it is almost enough to make one sick to think how sorry is their condition.

But there is a brighter side to this. Let's not be discouraged by the wrong doings of our forefathers, nor indeed for our own. There is no use in being downcast. The thing to do is to say to ourselves, and say it as if we meant it, "I will stop this waste ! I will begin now to build up my farm once more and have it, if not better at least as good as it was when I took it." That would be the most hopeful indication possible.

And we can all do that very thing. How ?

One of the best ways known of maintaining soil fertility is to feed out the stuff grown on the farm, or at least a good share of it, right on the farm, and turn the digested food back upon the land.

In our day we hear a great deal about humus. Humus. What is it ? Plain, old Anglo-Saxon words are always best. In simple language, humus, as we have in our soils to-day, is nothing more nor less than plants of all kinds which at one time grew here, have in their course rotted and fallen back on the ground and so in time become a part of the soil. That is all there is of humus, but it is a wonderfully interesting story to follow it through. That is not our object now, however.

What concerns us now is the fact that this humus has been taken out of the soil in one way and another, chiefly through the cultivation of crops. That is the great reason why our lands are so poor. And the question now is, how to get that humus back. Here is where the value of stock-keeping in some form comes in. Cattle eat grasses, roots, grain, all of which comes straight from the ground. Now if we take their droppings and put them back on the land, we restore to a great degree the soil elements we need.

So it is important that we should stop selling off the crops we grow so universally and turn our attention to some form of farming which will enable us to build up our farms. By the use of some kind of commercial fertilizers we may still further enrich the droppings from our cattle and do the work of building up faster than we could to depend upon barnyard manure alone. It takes good judgement to do this, however.

For this reason it seems to me that we cannot do anything better than to keep all the cattle we can economically on our farms. If we turn our attention to dairying, we shall all the time be realizing good returns for our work and at the same time be getting the fertility we need for our farms. Ashes and lime are fine to help out the manures we get from our cattle. We may plow under clover and other green crops and accomplish the same results. That, you see, furnishes us the rotted vegetation.

Once more, we need to take good care of our forests. These in turn help to keep humus in the soil. Because, forests aid in helping the land near them hold the moisture needed for crop production. We have done wrong in cutting our woods off ; but even here we may turn over a new leaf and undo what we have done in the past. We ought to do it It is such fascinating work ! If a man's heart is in it there is none more interesting in all the world.

A HABIT TO ACQUIRE.

There are few habits that any farmer can acquire that will be more profitable than that of asking himself constantly why he does this or that. If he asks and answers this one question in earnest, he is bound to learn a great deal, and is certain to become a better farmer thereby. The man who asks himself why he follows any particular practice, and seeks to get down to rock bottom in the matter, is bound to consider the principles with which his practice is concerned, and he is thus led to relate cause and effect. If this leads to a more intelligent understanding, it means not only that effort can be directed to better purpose, thus reducing the necessary amount of work, but it also means a great interest in the task at hand, thus lessening the sense of drudgery which must necessarily attach to any labor in which interest is not taken. To work merely to get work out of the way, going through an interminable routine of duties without the joy of understanding, has about it a great many of the elements of slavery. But the man who discovers principles and works with them is the conscious copartner with the great laws of the universe. Looking for the reasons may or may not change our practice. Agricultural investigation has shown that many of the old processes, based on experience are scientifically correct, and has shown why they are so. There are principles underlying all farm work, interesting reasons and facts back of them, and the habit of looking into them is a most useful and helpful one.

EDITORIAL NOTES.

Better livestock, better barns better poultry, larger crops, should be the vision of those who are now planning operations for next summer. The reality will doubtless be a larger bank account.

Law and Enforcement Made Necessary.

A well known Maine man, just now stopping in another State, is responsible for the following, given directly to the writer. Said he: "I was in a Grange session recently when one of the members brought in a barrel of apples he had just purchased and because they came from Maine, where a fruit law was in operation, he promised the company a rich treat. The barrel was marked Extra Fancy Baldwins put up by....., Maine. (I have the name and further evidence to used when desired. Ed.) When opened the apples showed large and fine for perhaps eight inches, but the great bulk, in the middle of the barrel, was too small and mean to make into cider or give the pigs. I tell you I felt ashamed of my own State."

What decent man wouldn't be ashamed? Here was fraud, which was intentional and this man who packed that barrel of apples ought to go to State's prison. There is no excuse for such dishonesty. Both the contents and the branding spoke of a deliberate purpose to defraud, and this merits severe punishment. Unfortunately the law we now have does not permit an inspector to open a closed package, but that authority must be given. Every man who desires to improve orchard conditions is the sufferer. The State has lost its old-time reputation by just such bare-faced fraud and to win it back an honest pack must be made certain in every case. The purchaser has the right to what he purchases and the State must see to it that he has it. Such dishonesty as is here reported must be stopped, or every department of business life in the State will be injured. The reputation of Maine is in the balance, and so long as one man deliberately cheats in packing and branding so long will every other apple grower suffer in reputation and loss in dollars. The good of the industry is far and away above the unrighteous gain of any one individual.

The substance of the above article which appeared in a recent issue of the Maine Farmer, apples to Maritime Provinces conditions as well. We note that several Maritime Province men were found guilty of violating the fruit markets act in 1909. We trust their number will constantly grow less.

Fertilizers and Humus.

Many farmers have a prejudice against the use of commercial fertilizers, thinking their use is an acknowledgment of poor farming. I cannot understand why this should be the case, for the application of commercial fertilizers restores the balance by adding the plant food which has been taken out of the soil. When bone meal is applied it is only returning to the soil what has been sold off in the bone of the animals produced on the farm. When acid phosphate or nitrate of soda is used it is taken from the inexhaustible store which nature has deposited in the south putting it where it is needed for the growth of plants. The same is true of the potash mines in Germany, where there is a great supply of soluble potash ready to be used as soon as that in the soil and such native sources as wood ashes are exhausted.

Many farmers fail in the use of commercial fertilizers because they do not realize that nature stores up in the virgin soil large guantities of humus which has been steadily depleted by each crop. The use of barnyard manure will increase the amount of humus. One of the chief advantages of commercial fertilizer is that it has no humus, thus lessening its bulk and enabling it to be shipped long distances, which could not be profitably done if it contained bulky humus, as stable manure does. In order to use commercial fertilizer successfully, care must be taken to keep the humus content of the soil up to the same standard as is found in new land. This can only be done by plowing in vegetable matter. Where clover comes in rotation every third year there will be no trouble in keeping humus up to the necessary standard, and in addition the supply of nitrogen will be greatly increased.

Where a fanmer is growing early maturing crops, as truck gardeners do, large amounts of soluble nitrogen are required in connection with potash and phosphoric acid, but the man who is interested in general, mixed farming or dairying, and who uses an up-to-date rotation, sowing clover every third or fourth year, will have little need for nitrogenous fertilizers. The clover sod and manure will supply the nitrogen and humus, but he will need liberal applications of potash and phosphoric acid. These materials are supplied most readily in a commercial form by acid phosphate and muriate of potash.

A good application is 300 to 500 pounds an acre of a mixture composed of one ton of muriate of potash to three tons of acid phosphate, or the same amount of a ready-mixed fertilizer, known as "10-8," which contains 10% phosphoric acid and 8% potash. An application of this kind of fertilizer will stiffen the straw, give a plump, hard berry and a greater weight per bush, as well as increase the yield to the acre. It will also assure a catch of clover, and when a good clover crop is obtained a profitable yield of grain is sure to follow.

In deciding upon the quantity or character of the fertilizer to be used, the farmer should not follow any given formula blindly, but carefully experiment on his own farm until he has decided just what combination of fertilizer will yield him the greatest profit.

Fifteen Farms Wanted.

Box 187, Sussex, N. B.,
Feb. 1st, 1910.

EDITOR MARITIME FARMER,
Sussex, N. B.

DEAR SIR :—In a recent issue of your valuable paper, I advertised my farm for sale.

It will be of interest to you to know that the single insertion brought me no less than sixteen enquiries from different parts of the provinces.

A number of the letters showed that not only had your paper a good circulation, but that it was more widely read than subscribed to.

The small amount spent for the sale of the farm was the cheapest method I could employ to gain this end, and evidently reached the people interested in farms and farming.

I am, yours faithfully,
HAROLD D. BUCHANAN.

EDITOR'S NOTE.—The ad. referred to cost $3.00, and as is shown by Mr. Buchanan, there are still fifteen of our readers, who are ready to buy farms. Have you a farm yon wish to sell? If so, try an ad. in the FARMER.

Changes in the Soil.

EDITOR THE MARITIME FARMER:—

The observing tiller of the soil will notice that as his farm grows older a change is taking place in the physical character of his land. Especially will he notice this change where grain crops have been continuously grown for a period of 15 or 20 years, and where the soil has had neither clover nor stable manure with which to hold its youth. As it grows older he will notice that it inclines more to be lumpy and crusty, is not as lively as it was when new. When a handful of this old soil is compressed, it is found to be not as elastic as the new, and when let go of, it does not spring apart and fall to pieces as it did 20 years ago. The fine, floury substance that works out of it when rubbed between the thumb and fingers is not in evidence as it was.

Why is this and what is the cause of the change? Nothing more nor less than the soil wearing out, simply getting lean. The humus or mold, that was for ages accumulating, is becoming exhausted. It has been worked out, washed out, and sucked out by the growing plants. This is not to say that the plant food has been used up, for the chemist tells us there is plant food in the soil sufficient to last for hundreds of years, but we cannot get it all out at once. It is what he calls unavailable food, the plants can't get hold of it. He also tells us that nature is provident in doling out her fertility. She gives it out slowly from year to year, and thus provides that man shall not rob the soil of all of its fertility in his own generation.

She permits him to take it out in abundance for the first few years after the virgin soil is opened up while there is a surplus. She makes an exception while he is getting started, building his home and equipping his farm, but in a little while this mold, this humus, the very essential in plant building, begins to grow less from year to year. The available surplus has been exhausted, and there will hereafter be a supply of food for the plants only as the elements of nature dissolve them and make them available, as the sun, rain and frost unlock fertility, which one year with another will be barely enough to grow very poor, or at least, ordinary crops. In time, it becomes necessary to depend upon commercial fertilizers to stimulate that chemical action of the soil, that liberates plant food, to hurry it up as the whip does the tired horse. This will force the soil to yield up its fertility faster, but at last there comes a limit, and it becomes necessary to go back and rebuild the soil in nature's way, by returning that which has been taken out, turning under green crops, filling it with clover roots and covering it with manure. This is the most expensive way, yet the only way as a last resort.

The eastern and old country farmers have learned this lesson by hard experience, and they know that the longer the day of replenishing is put off the more difficult it is to rebuild this run-down soil. It is like attempting to renew youth in an old man. There is but little on which to build.

Culture of Roots for Stock Feeding.

"The Culture and Varieties of Roots for Stock Feeding" is the title of a bulletin recently gotten out by the Cornell Agricultural Experiment Station. The work is based on the results of from two to three years' experiments in the growing of different varieties of roots most suitable for stock feeding under New York conditions. As regards cultural methods the work is general and adapted to any locality where roots can be grown.

Following is a summary of the report:

The seeds of root-crops are small and consequently are not capable of overcoming adverse soil conditions. A mellow well fitted seed bed with an abundant supply of moisture, but not wet, is essential. The land should be plowed deep in order to give the long-growing roots a chance to expand in the soil. Moreover, deep plowing insures a more uniform supply of moisture in the growing season. After the clods are subdued, the last fitting should be made with a light straight-disc harrow or planker in order to put the surface in garden-like condition.

Lime is almost always advantageous on soils planted to roots, especially for those of the beet type. Lime modifies the soil texture and corrects possible acidity. The quantity applied should be in the neighborhood of 2,000 pounds per acre. It should be reduced to a fine powder, either by slaking or by pulverising, and worked in at the last fitting.

The germination power of many of the seeds on the market is very low; thus it is important that all seeds should be tested before planting. The germination power of the beet type of root-crop seeds varied from 73 to 185 per cent., and that of the other root-crops varied from 15 per cent., in carrots to 96 per cent. in a variety of kohlrabi. This factor of low vitality is often responsible for poor stands and poor yields. Moreover, seeds of low vitality may increase the cost of good seed greatly.

The plants should be thinned before the tops become crowded, otherwise their growth will be spindling and the root system will not develop properly. If their development is checked at this time, the injury will be permanent.

A marked increase in yield of root-crops has been secured by rotation with other crops. In 1904 there was a gain of 24 tons of fresh substance with 3 tons of dry matter per acre in favor of the rotation. Rotation has been found to be very efficient means of restricting the spread of fungous and bacterial diseases, especially leaf-spot in mangels and sugar beets, and club-root, brown-rot and soft-rot in the cruciferous crops (as turnips and kohlrabi).

Early sowing is essential to a high yield of both green and dry substance. Corn and root crops moy be planted at about the same season; although, if rush of work prevents, the rutabagas and turnips may be planted a little later without much detriment to the crops. Early planting insures a long growing season and also takes advantage of those factors of the season, such as moisture and temperature, that favor root development. On the other hand, early planting increases the amount of cultivation to kill weeds.

When moisture and temperature conditions are optimum, shallow planting is to be recommended. Seeds of the beet type may be sown three-fourths to one inch deep; all others between one-fourth and one half-inch deep.

Cultivation should begin as soon as the rows can be followed. Cost is one of the most important factors in the economy of root-crop production; and labor in thinning and cultivating is one of the most important elements of this cost. Therefore, it should not be so much the object to produce high yield per unit of area as to produce a maximum yield per row. Wide rows, permitting the use of machinery and improved culture methods, are means to this end. If the stand is good, a weeder may be used for the first cultivation, driving across the rows. Shields should be used on the cultivators to prevent the soil being thrown against the young plants.

Shade Trees About Pasture Fields.

Live stock in the fields need protection from the hot rays of our blazing July and August suns; yet how few farmers upon our bald pastures have ever thought of putting in a few clumps of trees about the fence lines. From the standpoint of the comfort of the animals it would be a humane thing to do, and it should pay well besides. Away back as far as 1640 we find that the town of Hingham, Mass., passed a vote that "From the date hereof thenceforth, there shall be no tree or trees cut on the highway upon the pain of twenty shillings, because all good trees are to be preserved for the shading of cattle." More than 250 years have passed since this humane order was adopted, and we are supposed to have advanced in civilization, and yet there are not many in this country who have exhibited as much thoughtfulness for the summer comfort of their cattle as was shown by the men who passed this old piece of New England legislation.

HORTICULTURE

Fruit Growing in New Brunswick.

Fruit growing in New Brunswick was given an impetus Wednesday that will do much to put it on a commercially successful basis. The Agricultural Committee held a large and enthusiastic meeting and much of the time and attention was given over to a discussion of apple growing and the best means to be adopted to enlighten the farmers of the province as to the possibilities, financial and otherwise, along this line. A number of practical resolutions were adopted, one recommending to the department the advisability of taking over the supervision of a number of old orchards and demonstrations what can be done with them when intelligently managed according to modern methods; another recommendation was the premanent displays of fruit, grains and vegetables be placed on exhibition in prominent centres; and another recommendation was that a large Provincial Fruit Show be held next November at St. John.

Mr. Turney, the Provincial Horticulturist, was introduced by the chairman and he delivered an address replete with valuable information and practical suggestion. He said that in the development of fruit growing in New Brunswick there were several things he regarded as essential at the outset. First, each farmer should be impressed with the idea that he should raise all the apples and other fruit required for home use. There was no good reason for any farmer in this province having to buy apples for his home use. Every farmer can raise all he requires, and this was one of the things he proposed giving attention too. Secondly, was the demonstration of the commercial possibilities of orcharding in New Brunswick. This could best be accomplished through the New Brunswick Fruit Growers' Association. In the past considerable of value has been done by this Association in a small way but it was now proposed to reach out for larger things. It is suggested that a large and representative Fruit Show be held at St. John next fall, before the close of navigation, so that all parts of the province can be represented and at that show to give a practical demonstration of what the province is capable along the line of apple growing. In connection with the Fruit Show it is proposed to hold a three days's convention of fruit growers A third requisite which appealed strongly to him was the renovation of the old orchards. Nothing was more discouraging to the young farmer who was thinking of going into fruit culture than to see some of the old and run down orchards of his neighbors. He felt that the early efforts of the Department should be given to instructing the owners how to bring these unprofitable orchards up to a state of commercial productiveness. In this connection he suggested that the Department be authorized to take over the management for a few years of some of the old orchards for experimental purposes. The planting of new orchards was the fourth essential of successful fruit growing. He felt that the Department would not be justified in encouraging the setting out of new orchards until the commercial possibilities of those now growing have been demonstrated. His work in Ontario last year was wholly in the older orchards and in assisting the farmers to bring their fruit up to a state of productiveness Mr. Turney gave statistics showing what had been done in the Ontario county alone in the past few years by co-operative effort and through the instrumentally of the Fruit Growers' Association. A few years ago 3000 barrels of fruit suitable for export was the record for the county. Last year 19,000 barrels of apples were exported from those same orchards, showing what can be done by intelligent and co-operative effort. There are very large areas in New Brunswick, particularly the St. John Valley, splendidly adapted to apple growing. Another thing which Mr. Turney thought demanded attention was the kind of nursery stock which is being sold to the farmers of New Brunswick. On account of the small and haphazard was in which the farmers of this province are buying their young trees they are getting only the scrub stock in most cases. He thought the Department might well turn its attention to this matter and get the nursery stock in large quantities and of very best varities for our conditions.

Mr. Labillois, ex-Commissioner for Agriculture, said he had been very favorably impressed with what Mr. Turney had said, and he felt that every member of the Committee would agree that he was a man who knew his business. He felt that the Department of Agriculture would have the unanimous support of the legislature in adopting any practical methods to improve the old orchards of the province and also to provide the fruit grower with better nursery stock.

Appreciative remarks were made by Mr. Woods, Mr. Hartt and Mr. Pinder, each emphasizing the importance of demonstrating to the world and to our own people the great possibilities that await the successful fruit grower in this province.

The following resolution, moved by Mr. Woods, seconded by Mr. Hartt, was unanimously adopted :—

That in the opinion of this committee, the Department of Agriculture would be justified in taking over, by lease or otherwise, a number of the older orchards in various parts of the province, and demonstrating what can be done in making a commercial success of fruit growing.

Mr. Dickson brought up a matter and made a suggestion that met with the unanimous support of the committee, and that was the importance of having a representative display of fruit and grains and such vegetables, as are practicable, placed in the Departmental Buildings at Fredericton, for the inspection of visitors, and, if found feasible by the Agricultural Department, to also have a similar display at the Immigration Rooms in St. John and at the Agent General's Office in London.

Mr. Dickson said that every visitor to the province, if he can be induced to come to Fredericton, is taken to the Departmental Buildings, and is there given, as he supposes, a comprehensive idea of the resources of the province. He is shown specimens of the minerals of the province; he is pointed out the variety and beauty of the birds and wild fowl; and he is impressed with the size and fierceness of the bears, the majestic beauty of the "Monarchs of the Forest," and looks with curiosity and interest upon the beavers and snakes, the foxes and deer, the trout and salmon, and is impressed with the pleasures of camping and canoeing and hunting, as depicted in the many lovely photographs hung upon the walls of the buildings. He is even shown something of our great forest wealth, as exhibited in the specimens of native woods; but what is there in the whole building to give a visitor an idea that New Brunswick is an agricultural and fruit growing province ? He does not see even a modest display of fruit or grain nor a photograph of some of the fine farms of this country.

It was quite true that these other things are valuable and have doubtless resulted in much good to the province; but, after all, the visits of the sportsman are only transitory and the wealth left in our province by the anglers is but insignificant in comparison with what might be accomplished if these visitors could be interested in our agricultural development. Without, in any way, disparaging what has been done and is being done by the Department and by the Tourist Associations to make the hunting and sporting attractions of New Brunswick known abroad, he thought that the Agricultural and Horticultural Departments might well push the farming possibilities to the front.

He suggested that a display of apples and other fruit raised in the province be prepared by the Provincial Horticulturist and placed on permanent exhibition in the Departmental buildings, be given just as much prominence as are the specimens of game and fish, woods and minerals, hunting and fishing scenes, which have proven so attractive to the visitor. He believed that the Horticulturist was at the present time preparing an exhibit of fruit for a National Exhibition to be held in Berlin, and he thought it would be a good idea for a duplicate of that display to be arranged for home consumption.

And in this connection Mr. Dickson thought a similar display ought to be on exhibition at the rooms of the Superintendent of immigration at St. John and that display should include not only apples and fruit but grain, in the stalk and threshed, such vegetables as can be preserved for such purposes, views of farm life and farm homes taken in various sections of the province; in fact everything and everything that would give the visitor or immigrant an intelligent and comprehensive knowledge of the agricultural and horticultural possibilities of the province. He was sure that the expense of collecting and arranging such a display could not be very great, while the expense of upkeep would be practically nothing; while as an educative feature he felt certain that the results would be very far reaching and of great permanent good.

The suggestion of the chairman was favorably spoken to by several, and the following resolution was moved by Mr. Labillois, seconded by Mr. Allain and adopted :—

That the Horticultural Department be recommended to prepare a comprehensive display of fruits, grains and vegetables, of the province, and have such displays placed on permanent exhibition at the Department at Fredericton, at St. John and at the Agent Generals offices at London, and other places thought to be of advantage to the province.

Deputy Commissioner Hubbard expressed his conviction of the great possibilities of apple growing in New Brunswick. The Nova Scotia orchards netted their owners one million dollars last year, yet in this province we have ten times the area specially adapted to apple growing that they have in Nova Scotia. He believed that it would be well for the fruit growers of this province to specialize on varieties best adapted to our conditions. The Montreal district had specialized on the Fameuse apple and that apple is selling in London at about ten cents each, yet we in New Brunswick can raise successfully a better quality of Fameuse than is grown in Quebec. The same is true regarding the McIntosh Red, which is selling in New York at $10.00 a barrel. The west had specialized on apple growing and today apples from the west are selling on the Boston market at $5.00 a box of less than one hundred apples. He thought the proposed fruit show in St. John would do much to stimulate apple culture as a commercial enterprise.

It was moved by Mr. Hartt, seconded by Mr. C. M. Leger; Resolved, that in the opinion of this Committee arrangements should be made to hold special fruit exhibition in the city of St. John next November to demonstrate what can be done in the production of fruit in this province upon a commercial scale.

The subject of commercial fertilizer discussed at previous meetings of the committee, was also discussed further. On the recommendation of the sub committee to which the question had been referred, it was decided to ask the Department of Agriculture to further pursue its investigations during the present year, and if possible, work out a scheme for the importation of the chemical ingredients in large quantities and the distribution of same among the province.

VANCO CANADIAN MADE

Lime Sulphur Solution

shows on analysis a higher percentage of active sulphur in solution than other brands or the home-boiled article. It is therefore more certain to thoroughly destroy all parasites and fungi, including the San José Scale.

VANCO is a clean solution—free from useless sediment—all good. One barrel makes 12 for winter or 50 for summer spray.

$8.00 per bbl. f.o.b. Toronto.

Lead Arsenate

kills 95% of codling moths where Paris Green at its best will not kill over 75%. It is a sure destroyer of all leaf-eating insects. Easy to spray as it settles slowly and does not clog the nozzle.

Sticks much better than Paris Green. **Never burns or injures the foliage.**

The majority of experts and authorities throughout Canada and the United States have adopted Lead Arsenate.

10c. to 13c. per lb. according to quantity.

Club Your Orders and Save on Freights.

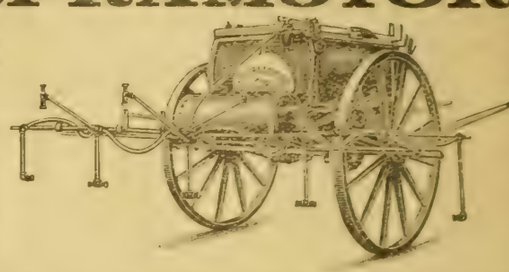
There's much valuable information in our Booklet on Lime Sulphur Solution and Lead Arsenate. Write for it—it is free.

CHEMICAL LABORATORIES LIMITED,

MANUFACTURERS OF CHEMICALS

148-158 Van Horne St., - - Toronto, Canada. 6

THE SPRAMOTOR



shown here, will rid an acre of potatoes of blight and bugs in 20 minutes. The only aid required is a horse. What do you think of THAT? Has non-clogging nozzles, 12-gallon air tank. 125 lbs. pressure guaranteed with 12 nozzles open. Agitator, clean-out and pressure relief into tank, and nozzle protector, controlled from seat. Can be fitted for orchard, vineyard and grain crops. For 1 or 2 horses, or hand operated, if preferred. Write for free brooklet.

EATON'S CATALOGUE

SENT FREE FOR THE ASKING

The Profit from your Herd of Cows is governed by how much Cream you have to sell

NOTE OUR PRICES FOR DELIVERY TO YOUR NEAREST RAILWAY STATION

THE EATON CREAM SEPARATOR

SKIMS CLOSE AND CLEAN

RUNS EASY

You are assured of obtaining the last grain of Cream from the milk with an EATON to do the work.

You may have the best herd of cows in the country as far as milk flow and butter fat in the milk goes, but unless your Separator skims clean you are not getting all the cream from the milk, and it's the cream that makes the money. Every particle of cream left on the milk is lost profit. Try the **EATON** Separator and you'll increase your profit because you get all the cream.

SEE THE NEW SPRING AND SUMMER CATALOGUE, PAGE 223

Saving Money on Your Household Needs Depends on You

It's to your interest and profit to study the goods and prices in this Catalogue. It has been prepared with the idea of making it convenient and easy for the farmer to choose goods that will meet with his desires at a price that is lower than he has been used to paying. Many thousands of our present customers buy all their household and farm needs from the pages of this Catalogue.

Those who have traded with us continue to do so, because they realize that the saving of a few cents on an order of goods is just as profitable as securing a higher price for farm produce.

It's only by sending an order for the goods you require that brings to you the full advantages of our low prices. Don't stop with sending for a saw or hammer, a suit or a pair of shoes—buy a cultivator, cream separator, a wagon—in fact send for every single thing you or your family needs. Thus you will be reaping the full benefit of the large careful buying and economic selling that make our prices so reasonable. If you can save 10 per cent. or 20 per cent. per week or per month on your purchases and still have better goods, you know that in a short time your savings will be very useful for many different things you really would like to have for yourself, or for your family or for your home.

Remember that if the goods are not satisfactory for any reason we return your money in full and pay all transportation charges.

Decide now to make a determined effort to get every benefit for yourself which thousands of other families are enjoying.

The Renovation of Old Orchards.

EDITOR MARITIME FARMER.

Is my old orchard worth renovating is the question uppermost in the minds of many farmers to-day. In reply, I would say that if the trees are not more than thirty-five years of age, have not been allowed to develop their bearing wood too high up, and are not too badly broken, through disease and neglect, the task of putting them in a profitable condition is comparatively simple. Undoubtedly, there are some orchards in the province, which, although they have never received any care, being covered with moss and lichen, are yet strong, thrifty and in a condition to yield handsome returns, under proper treatment. To renovate such orchards proceed as follows :—

1. Remove all dead and broken limbs, taking care to leave as neat and short stubs as possible. Prune, but not too heavily at first, removing enough limbs to admit the entrance of sunshine and circulation of air to the centre of the tree. Work as far as possible from the outside of the tree. This work may be done in March, or the first two weeks of April. Do not attempt to take out all the wood that should be removed, in one year, but content yourself with removing one-half the first year and completing the thinning out operation the second spring. Coat all large stubs and wounds with a heavy white lead paint, to which has been added enough green paint to color it.

2. The trunks and main limbs of neglected trees will be covered with shaggy bark, moss and linchen, which furnish a beautiful winter home for insects and spores of fungous diseases. To remove these, the trees should be well scraped. A short handle fitted into a small hoe, or better still, into a small triangular shaped hoe, makes a very efficient implement for the work. Spraying will be made much more effective when the trunk and main limbs of the trees have been rid of their rough covering and the surplus limbs thinned out.

3. Spraying must be systematically and thoroughly undertaken. It would be well to spray first before the growth starts, using the following solution : Concentratad lye, 1 lb.; lime, 30 lbs.; water, 40 gallons. Slack the lime, make up to 40 gallons with water, and then add the lye, straining through a fine mesh before using. This solution will successfully combat the oyster shell scale and help to remove old bark, moss and lichen. Succeeding sprayings with Bordeaux mixture and an insecticide should be applied as per spraying instructions given below. Thorough and systematic spraying, kept up for a few years, will overcome the results of neglect.

4. In many old neglected orchards the soil is very poor and run down, having been depleted of much of it's plant food. We must, therefore, endeavor to build up the fertility of the soil. There is nothing better for this purpose than well r tted barnyard manure. Apply a good top dressing in the spring, and turn under shallow. If the sod is not too thick and tough, it might be worked up with a disc harrow instead of ploughing.

5. Improve the physical condition of the soil by the adoption of cultivation wherever possible. After the ground has been ploughed in the spring, as above recommended, keep cultivated until the first week in July, and then seed down with a leguminous cover crop —if crimson or red clover is used, sow from 12 to 15 lbs. per acre. This should give a good stand by the fall of the year, check the green growth, ripen up the wood, and help to hold the snow through the winter. It should be ploughed under in the spring, serving as a green manure crop to improve the physical condition and fertility of the soil This completes the first season's operations. Repeat next year with modified pruning.

The first season's work will result in increased vigor of the trees, cleaner, but probably not more fruit. The second season the fruit will show a decided improvement over that of the first year, and in the third year, but not until then, you may expect the orchard to be in a good condition and to bear heavily.

Remember the results cannot be accomplished in one year only, but there will be improvement each year, if you do the work thoroughly. The treatment outlined above has never failed to bring satisfactory results, where properly applied. It is useless to undertake this work unless you are prepared to exercise care, patience and thoroughness in all the operations.—A. G. TURNEY, Provincial Horticulturist, Fredericton, N. B.

The N. B. Provincial Horticulturist in Harness.

Mr. A. G. Turney, Provincial Horticulturist, spent three days, March 3rd, 4th and 5th, in Charlotte County, under the auspices of the St. Andrew's and St. Croix Farmers' Institute. Demonstrations of pruning and grafting were given in the illustration orchard at Waweig, on Thursday afternoon, and in the orchard of Mr. Lawrence, at Bayside, on Friday afternoon. Evening meetings were held at the manse, Waweig, and at the Beeverhill schoolhouse, at which Mr. Turney spoke on the improvement and establishment of home orchards, and on strawberry growing. He urged the advisability of local farmers capturing the profitable summer market for small fruits in the neighborhood of St. Stephen and St. Andrews, which market, up to the present time, has been supplied from Montreal. On Saturday morning Mr. Turney visited some orchards in the Beeverhill section and advised their owners as to treatment, and in the afternoon he pruned the illustratation orchard of Mr. W. E. Armstrong, at Waweig. Considering the unfavorable weather, the meetings were well attended, and considerable interest manifested.

WINDSOR BUTTER SALT

Used by all Prize Winners

The Farmer's Daughter

knows how important it is to use the best salt in butter making.

She knows that WINDSOR BUTTER SALT dissolves quickly and completely, and works in evenly.

She knows that WINDSOR BUTTER SALT makes the richest, creamiest Butter—improves the flavor—helps to make the butter keep better.

At all the big fairs last year, practically all of the prize winners used

Windsor Butter Salt

Learn why the FRICTIONLESS EMPIRE runs easier than others

If you've ever used any other make of separator you'll marvel when you turn the Frictionless Empire. So nearly frictionless that it almost runs itself. Will run for half an hour after you've finished skimming, unless you stop it with our brake.

The Frictionless Empire is the only separator with ball bearings at top and bottom of bowl-spindle. Other makers would jump at the chance of using our Ball Neck Bearing and Three-Ball Bottom Bearing. But our patents prevent others using these friction-eliminating, easy-running, long-life features.

These ball bearing features, together with the lighter bowl, fewer closed bearings, more easily cleaned skimming devices, etc., make the Frictionless Empire the one really good cone separator.

Years of service prove their worth. Empire quality in every machine, and a guarantee as good as a gold bond.

Some day you'll own an Empire. In order to hasten that day we want you to read our new 25c. book. It tells the truth about the two standard methods of cream separation. Gives valuable dairy pointers.

We will send you one copy free, provided you tell us the number of cows you keep. Also name of this publication. Don't miss this book. Send for it immediately. Extra copies 25c. Ask for book No. 26

The EMPIRE Line of Cream Separators

consists of a full range of sizes in both Frictionless Empire (cone method) and Empire Disc. The choice of either cone or disc method, and the size of machine, rests entirely with you.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Value of Salt for Milch Cows.

It has always been my advice to owners of farm stock to place salt where it can be conveniently got at by the animals. Salt should enter at all times into the food of the dairy cow, and it should be kept where she can partake of it ad limitum. Both the quantity and quality of milk are considerably affected by withholding salt till the cows get hungry for it. Cows in the season of lactation require more salt than at other times, and the cows that give most milk require most of it.

Sodium chloride, or common salt, is very widely distributed in both the animal and vegetable kingdoms, and being a normal constituent of nearly all animal organs, and fluids, undoubtedly plays an important role in the process of nutrition. Such being the case, it is essential that an adequate amount of salt be obtained either in the food consumed, and water drunk, or as a direct addition to the ration. The food and water always contain some salt, but the amount varies widely in different localities, and is rarely sufficient to satisfy the desires of an animal, so that more will not be taken if offered. When allowed free access to salt, cattle will consume from one to eight ounces daily—the last amount is, however, rarely reached, and the average amount would probably fall below three ounces. In general, it has been observed that cattle having free access to salt have a better appetite, and are less affected by changes in the ration than those receiving no salt except that contained in the food. It is claimed that milch cows require more salt than other cattle, and that if it is withdrawn there will be an immediate and decided falling off, both in the yield and in the quality of milk. The trials that have been carried out agree in the following particulars. Cows having been deprived of salt for two or three weeks exhibited an abnormal appetite for it, but the health of the animal did not seem to suffer for a far longer period. This period of immunity varied with individual cows from less than one month to more than one year. In every case there was finally reached a condition of low vitality, in which a sudden and complete breakdown occurred from which recovery was rapid if salt was supplied. The breakdown was most likely to occur at calving, or immediately after, when the system was weakened and the flow of milk large. In general, the cows giving the largest amount of milk were the first to show signs of distress. It seems probable that a dry cow or a steer would suffer no great inconvenience if given no salt except that contained in their ration. The uniform results obtained from the cows in the trials I am quoting indicate beyond question that salt in addition to that contained in the food is absolutely essential to the continued health of a dairy cow while producing milk. It is evident, moreover, that the amount of salt which must be supplied directly will vary greatly in different localities, it being more at high elevations and at places remote from the sea.

W. R. GILBERT.

Lessened Production.

"August records received at Ottawa from members of cow testing associations indicate that in most districts the flow of milk is well up to the average. In some localities there is but a very slight decrease from July yield of milk, so light, that the increasing richness shows a trifle higher yield of fat.

"In other localities, unfortunately, there is a very marked shrinkage, as much as 120 lb. and even 180 lb. milk per cow less than in July. Many dairy farmers have accordingly vowed that next year will not see them caught without any provision for maintaining the flow, but they have determined to provide some soiling crop, and if possible build a silo, so as to ensure succulent feed for probable hot spells in July and August. Such men are wise.

"Some districts have as high averages as 870 lb. milk, and 29 lo. fat in August. Such wise dairymen had made provision of suitable feed. Others, less provident, had to be content with a yield of 580 lb. milk and 21 lb. fat per cow; while here and there the average yield was down to 390 lb. milk and 16lb. fat. Such men might well copy the methods of their brother farmers who regularly secure the larger yields. Selection of the best cows can be made intelligently when records are kept of each cow."

The foregoing announcement, issued last September by the Dairy Division, Ottawa, contains a note re the providing of succulent feed for our dairy cows during the season of short pasturage. It is not too early to plan for next summer's soiling crops. When ordering your other seeds do not neglect seeds to be sown for soiling crops, and get them into your soil as early as conditions will permit.

DAIRYMAN,
Pictou Co., N. S.

To the Interest of Every Factory.

The question of supply of raw material to the cheese factory and creamery is a first consideration; the finished product is paying quantity and of good quality is mainly dependent on a large supply of good milk and cream.

As the supply is also of importance to every director of any dairy company, every factory owner and every maker, such men should see to it that each patron is interested in cow testing. Once a patron begins testing each cow individually he commences to take a far more interest in the herd generally and is likely to supply not only more milk and cream but far better quality, and cared for better. In many herds the milk yield has been increased by twenty and even thirty per cent in three years through a knowledge of each animal's capacity, which led to weeding out the poor cows and feeding the good ones a little better. Is it not to the advantage of every factory to see its patrons properous? If farmers supply more milk or cream from a given number of cows, or from a certain number of acres, it means that the factory receives more raw material from the same territory, thereby lessening the cost of hauling, and lowering in proportion the expense of making, while a longer factory season is possible as the milking period is extended.

Factory officials are invited to recommend cow testing to all their patrons. If a list of names and addresses be sent to the Dairy Commissioner, Ottawa. literature on the subject will be mailed direct to each.

C. F. W.
Ottawa,

Straining Milk.

Mr. I. C. Weld, in a paper on the lessons of milk and cream contests says: "One of the things that occurs to me is that on farms where milk is produced, as one inspects the barn and the various details which enter into dairy work, some dairymen take particular pains to tell you how many thicknesses of cloth they strain their milk through. It is a good thing to strain milk, I am not saying a thing against it; but do you realize that if there is any dirt in the milk it is almost impossible to strain it out? And don't you know it will be a great deal better if you can tell visitors to your farm how painstaking you are to keep the dirt out of milk rather than how painstaking you are to strain it through six or eight thicknesses of cheesecloth?

LIVE STOCK.

Warding off Sheep Troubles.

Now about prevention: Scientists may proclaim that sheep pastures will not become infected with worm embryos. They cannot survive the winters of the northern states they tell us. But practical shepherds and farmers know, by experience that they can't safely pasture any one field with sheep more than one, or at the extreme, two years without there being some sheep in the flock manifesting symptoms of worms; and if, by force of necessity, pastures must be used for sheep year after year, the sheep must have some remedy constantly ready for them to instinctly help themselves to.

I don't think, after much study and experimentation, that there is any one remedy that will protect a flock constantly exposed to infection, for sheep, in eating the blades of grass, take the eggs of worms into their stomachs. But I do think that if a box of salt is kept covered in some place frequented by the sheep to help themselves to, and if said salt is saturated with spirits of turpentine in proportions of a gill to every four quarts of salt it will wonderfully help to keep the worms from multiplying.

It is well also to have another box of larger size, where sheep can help themselves at will, filled with tobacco stems. These stems should be cut up in inch lengths and from time to time a quantity of wheat bran should be put on top of the stems. When this is done the sheep soon instinctively learn to use tobacco and no young intestinal worm or stomach worm, expect the tapeworm, can stand the diet. This will not kill mature worms. It will only prevent the worm family-multiplying to the extent of injuring the health of the sheep.

But no sheep owner should feel wholly satisfied by preventive treatment of stomach worms. Twice a year the whole flock should be drenched with some agent which will destroy the mature worms. There are two very very inexpensive drenches which will quite effectively do this. The one is gasoline, the other coal tar creosote. The objection to gasoline is that it needs to be so very carefully used or sheep will be killed by it. The dose is one tablespoonful (never more at one dose) to a mature sheep; mix with not less than four tablespoonfuls of raw linseed oil (never boil it); then add a half pint of sweet milk. In giving, set the sheep upon its haunches and shake the liquids well together until the last minute it is administered, or the gasoline will separate, and if it enters the stomach in an unmixed form it will seriously injure and may kill the sheep.

There is no direct vermifuge that will as effectually kill all species of worms in sheeps stomach and intestines as will gasoline; yet the coal tar cresote or the more refined class of sheep dips will, if given after a full twelve-hour fast and before the flock is turned to pasture in the spring, and again about November, destroy a large number of the mature worms. All lambs born in April or May should be drenched about August or September following, to be certain of ridding them of worms that may later cause their death. The dose of any of the creosotes named is a desert-spoonful mixed in a full half pint of water. This is perfectly safe to give when given as advised. The minimum dose will be just as effectual and the the owner is always safe from loss in sheep by over-dosing.

The keeping of sheep by the thousands on the great western ranges will soon be over. The numbers are too great for the owner to give them necessary attention. It is the small flock owner who is able to become familiar with practically every sheep in the flock; as he yards them or goes to the field among them he can, at a glance, note as to whether any are dropping or not, or not thriving as well as they should. In the future it is to be the small flock, one hundred or less, well looked after, that will supply the demand for wool and mutton.

Brood Sows.

A recent writer in Breeders' Gazette in discussing the hog question, gives the following remarks on the care necessary for brood sows:

When hogs are selling for 8 cents per pound live weight the farmer cannot be too careful of his breeding herd. If one wishes to have large healthy litters of pigs for next year's market one must provide one's brood sows with a mixed ration. Corn alone does not provide a sufficient feed for the brood sow, yet because it is handy, plentiful and comparatively cheap it is fed lavishly on the majority of farms. Its indiscriminate use results in "back luck" at farrowing time

Experiment stations advise the feeding of clover or alfalfa hay and skimmilk or buttermilk, and while there can be no question as to the value of these feeds few farmers in Illinois who keep 40 or 50 brood sows can feed any except clover hay to advantage. On many farms milk is not plentiful enough to balance a ration for a number of sows and one is obliged to have recourse to something else to supply the required amount of protein. Writing from personal experience we have had splendid success in feeding old process oilmeal and shorts where a large number of sows are kept. These feeds are mixed as a thin slop and a good feed given every other day. When rye or inferior wheat is on hand it is ground and used instead of shorts. We fed oilmeal as indicated last winter and 20 sows averaged 8 pigs to the litter, and not a dead pig at farrowing time. In the summer the herd was attacked by cholera, yet as all the old sows were in prime condition after weaning their pigs none of the sows died. If sows are carried in good condition on corn alone they never farrow satisfactorily

Of course judgement must be used even in feeding oilmeal, as too heavy a feed, especially at the start, would likely result disastrously. Cottonseed meal should not be confounded with oilmeal, as the former should never be fed to brood sows.

A few years ago we built a hoghouse for the use of brood sows before farrowing, something in the style of a horse barn. Stalls were built 8 feet apart and all stalls were well bedded The sows would lie two and three together in each division and never crowded, even in the coldest weather. When a large shed is used, undivided, hogs are certain to over-lay and this condition should be guarded against. Each morning in winter if the weather is not too severe the sows are turned on a twenty acre bluegrass pasture and allowed exercise all day. There is no trouble in exercising the Duroc-Jersey hog, but when the Poland-China are in the herd it is advisable to fasten them away from the hog-house during cold weather.

The farmer who gives his breeding herd even moderate care is usually successful while the herd that is allowed to care for itself is sure to be a disappointment.

The Flock in Winter.

It is now winter, Nature has asserted herself once more. Pastures are a thing of the past, being covered so deeply that not a turf or bunch of grass can be seen. There is nothing there to induce sheep to work for, so we must use some means whereby they can be exercised, especially the breeding ewes. This may be done by driving or by feeding in roomy yards, spreading hay, so as to induce them to exercise themselves while feeding. This works very well, and while they are out for a few hours, except stormy days, the rack may be filled ready for their return at night. They will wend their way home quietly and take their exercise in a natural way, while in driving them one is apt to get in a hurry.

They come in with an appetite ready to devour their clover hay, oats, bran and oilcake, and as the shepherd says, "Hungry enough to eat the boots off your feet." They are out every day except wet, or very stormy. Plenty of fresh air add pure food and water with healthy sheep, a dry bed free from draught, is all that is absolutely necessary to make mutton. The remainder depends upon the shepherd. The eye of the feeder is his guide.

The ewe flock must necessarily contain ewes of various ages, old and young strong and weak. The strong ewes will require nothing but good hay, pure water and exercise, until a month prior to lambing; then they should have a little grain once daily. A good ration of oats, bran and oilcake, minced equally by weight, has proved very good with us. The thinner ewes should have better care. If crowded for room put them with the ewe lambs. Feed grain at least once daily. A pound per head of the above mixture will be sufficient, and a small feed of oats, mangels or Swede turnips at mid-day will be eaten with a relish and with good results. I would not advise feeding roots in zero weather unless one has very warm quarters and then I do not believe in too many, as they contain a great amount of water, which in cold weather is not required; in fact, is detrimental. Save them until the

KING BUG: "WELL BOYS! I KNEW SOMETHING FEARFUL WAS BOUND TO HAPPEN WHEN I HEARD THE CANADA PAINT COMPANY WERE SHIPPING THEIR PARIS GREEN TO THESE PARTS."

BLIGH & PRINCE AGRICULTURAL IMPLEMENTS and CARRIAGES TRURO, N. S.

Planet Jr.

Planet Jr implements are the greatest time-savers and labor-savers ever invented for the farm and garden. They frequently do six men's work, and do it better than by ordinary methods. Over two million farmers and gardeners have found this out by actual use. *You* can't afford to be without a Planet Jr.

No. 17 Planet Jr Single-Wheel Hoe is a most handy and effective tool for garden cultivation. A fine tool for working close to crops, especially in late work.

New No. 81 Planet Jr Horse-Hoe, Cultivator and Furrower is a great implement for cultivating and hilling crops up to 4 feet apart. Compact, strong, and steady-running. Does just the kind of work you want.

Come and see our full line of Planet Jr labor-savers.

We are sole agents in Nova Scotia for the celebrated "Planet Junior" goods.

warmer weather in the spring when the appetite needs a little encouragement. A few roots fed then will be found very advantageous, not only as a factor to increase the milk supply, but as luxury and a change of diet. They are cooling to the system, and more grain may be fed in connection therewith than without.

Close observation and a little common sense are the most essential qualifications of the shepherd. You will always find the shepherd who is continually having hard luck is the one who never has time to do anything properly. To be a good shepher requires as much thought and careful attention as any other vocation known to mankind.—Shepherd's Journal.

Co-Operative Breeding.

Co-operative breeding, as viewed by a writer for Orange Judd Farmer, gives promise of great achievement in the future. As at present carried on much of our breeding is done in the dark. Unworthy sires are used. Breed is almost entirely ignored.

If a community will form an association, study the breeds; and carefully select the breed they like best, and is best suited to their conditions, and that they will be willing to stand by ever after, when they will have laid a sure foundation for future prosperity.

This much we know, that when an association is formed interest is aroused, and a desire for better things is inspired. Full-blood sires are bought, and if a man feels too poor to buy a good animal alone, two or three will go in together and buy. As good sires are bought, exchanges are made, so a choice animal can be kept near the same locality during the entire period of his usefulness.

Particular emphasis is placed upon the character and efficiency of the secretary: The secretary should be a live business man, be in touch with every member. he should know what stock each one has, and what he desires to have. Through him exchanges are made, buyer and seller brought together. When they have stock to sell he carries advertising for the whole association, thus lessening the expense. He should have the registry books of the breed, so a prospective animal can be traced, and its worth determined. When animals are for sale they are reported to the secretary, so a buyer can find out by him just what can be bought, ahd where it can be bought, and a buyer will go to such a place, when he would not go from house to house in the uncertainty of finding what he wanted. In shipping there is also an advantage, as animals can be shipped much cheaper in carlots than singly.

Cow testing associations are apt to follow, friendliness is promoted and speakers may be obtained through the agency of such an association.

Lake Mills, Wis., is noted the world over for its cattle, because breeders have been working together raising one breed. A buyer has larger numbers to pick from, he can buy in large lots, and he can get what he wants, and he is willing to pay the price. This is business; straight, honest, legitimate business. It will give an uplift to the farmer himself, it will bring comforts to his family, and education to his children.

Lice on Hogs.

Hogs often suffer very much from vermin. Lice are introduced from neighboring herds, and the losses in feeding are often severe, especially among young pigs, when death is sometimes a secondary result if not an immediate result. When very numerous, lice are a very serious drain on vitality, fattening is prevented and in case of exposure to disease, the lousy hogs are much more liable to contract and succumb to it. Newly purchased hogs should be carefully examined for vermin and they should not be turned out with the herd until they are known to be free from these pests.

When the herd is found to be badly infested with lice, all bedding should be burned and loose floors and partitions torn out. Old boards and rubbish should be burned. The quarters should then be thoroughly disinfected by spraying with good solutions. After disinfection, as in the case of a disease outbreak, everything about the place inside and out, should be thoroughly whitewashed.

Vermin are most common around the ears, inside the legs, and in the folds of the skin on the sows sides and flanks. In light and isolated cases, they may be destroyed by washing the hogs with an emulsion of crude petroleum or of kerosene or with a stock dip properly diluted, applied by means of a broom. In severe cases, however, especially where the whole herd is affected, thorough spraying or dipping should be resorted to. In this case a dipping tank will be a great convenience.—GEO. M. ROMMELL, Department of Animal Industry, Washington, D. C.

Stock Notes.

Pure-bred seed goes hand and hand with pure-bred stock and is every bit as essential.

The most prominent "catch crop" just now is to catch up with the weeds.

Speaking with a nearby farmer recently, he said that, his da,'s work commenced at sun-up and ended at sundown."

What do you think of the plan, dear reader?

To me, it seems little short of folly;—I can scarcely see the necessity for it, unless it might be accounted for by the fact that the nanagement was very poor.

Excessive hard labor on the farm must certainly be due to rank management and an effort on the part of the farmer to accomplish everything by brawn alone and not use brain at all

There is no reason on earth why a day's work on the farm should not be about the same as it is anywhere else

Industry is not the only thing that is necessary on the farm—if it were, I know of several men who have failed that would have succeeded.

Keeping everlastingly at a thing does not always bring success, in spite of the trite saying that it does.

The more persistantly some people labor the worse off they become, simply because, they are not expending their energies in the correct way and along the most profitable line.

The Importance of the Tuberculin Test

If there were no state laws, no city ordinances, requiring the tuberculin testing of cattle, I contend that it is to the interest of every stock owner to apply the tuberculin test in a nice, clean, sensible manner of his own protection.

By applying the test you determine whether or not you have tuberculosis in the herd and the least that can be done would be to remove the tubercular cattle from the herd, or if this were not convenient, move them to one end of the stable, or better still, a partition might be placed between the healthy and infected ones. In this way you would protect the balance of your herd. As I have often noticed, where one tubercular animal is found in a herd, usually the ones on either side become infected sooner than animals further from her, showing that the disease is more apt to be spread by actual contact than otherwise.

Another very important method of preventing and overcoming tuberculosis in cattle is to have a thoroughly ventilated, sunlighted, well drained stable. Owing to the fact that the direct rays of the sun will destroy germs, is a very good reason why at some hours of the day the sun should be permitted to shine on all parts of walls and floors of stables where cattle are housed. If this be impossible the sunlight should be substituted by a good, reliable germ destroyer as it is unreasonable to expect a herd to thrive and do well where the germs of any diseases are present.

DR. DAVID ROBERTS.

You Can Afford to use 40c. Tea Just as Well as 30c. Tea if You Use 40c. Red Rose

A pound of 40c. Red Rose goes further than any 30c. or 35c. tea and it is distinctly superior in quality.

30c. and 35c. Red Rose Teas are good teas, so good that very many people say they want nothing better. But, if they would once try a package of the 40c. Red Rose they would use nothing else in future

Just think, five cups of 40c. Red Rose Tea will only cost 1c. One lb. makes over 200 cups. Not a question of affording.

RED ROSE TEA "Is Good Tea"

WILL YOU TRY A PACKAGE?

B

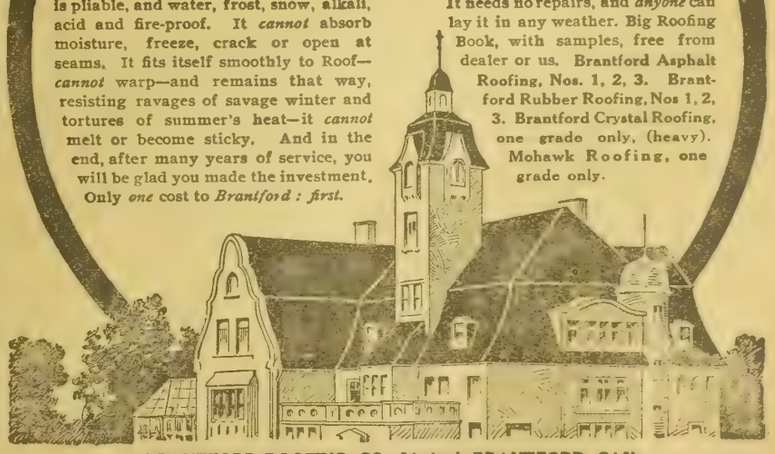
HOW LITTLE RAIN-WATER REBELS SECRETLY DESTROY MOST ROOFING

Rain-water is deadly to nearly all Roofing, except *Brantford*. It contains millions of little germs which eat away its very *life*, and you are not aware of this rebellion until Roofing is destroyed. Wood pulp, jute, cotton-cloth, etc., is used as a foundation in most Roofing. It is lifeless, and cannot fight for itself. The refuse coating which does not possess one particle of resistance, is itself injurious to Roofing. Slight bending will produce numerous cracks or open seams, because it is brittle. But the foundation of *Brantford Crystal Roofing* is a long-fibred, evenly condensed sheet of pure *Wool*, which goes through special Saturatory Process, forcing Asphalt saturation through and through, and becoming as hard as flint. This saturated Wool now, alone, is capable of resisting the onslaught of *any* enemy. But to make it doubly durable *Brantford* is heavily coated with weather-resisting, fire-proof Rock Crystals, which require no painting. After going through this process no Roofing Enemy can effect it.

Brantford Roofing

is pliable, and water, frost, snow, alkali, acid and fire-proof. It *cannot* absorb moisture, freeze, crack or open at seams. It fits itself smoothly to Roof—*cannot* warp—and remains that way, resisting ravages of savage winter and tortures of summer's heat—it *cannot* melt or become sticky. And in the end, after many years of service, you will be glad you made the investment. Only *one* cost to *Brantford: first.*

It needs no repairs, and *anyone* can lay it in any weather. Big Roofing Book, with samples, free from dealer or us. Brantford Asphalt Roofing, Nos. 1, 2, 3. Brantford Rubber Roofing, Nos 1, 2, 3. Brantford Crystal Roofing, one grade only, (heavy). Mohawk Roofing, one grade only.



BRANTFORD ROOFING, CO., Limited, BRANTFORD, CAN.

THE HORSE.

Corns.

A corn consists of an injury to the sensitive horn of the foot and the soft tissues beneath, causing at the same time a rupture of the same blood vessels. The escaped blood works through the horn of the sole, staining it a dark red color. The location of a corn is on the sole in the angle formed by the bar and wall of the hoof. The front feet are most usually affected, because they support about two-thirds of the weight of the body and, also, during movement, the heel of the front foot is placed upon the ground first. Three kinds of corns are generally recognized. The dry, moist and suppurating.

The dry corn is recognized by the blood-stained horn and is not attended with excessive inflammation.

Moist corns are recognized by the large amount of inflammation, shown by the fluid accumulating in the region of the corn.

Suppurating corns are the moist corns which have become infected with pus germs.

Among the causes and conditions which predispose of corns may be mentioned to excessive thinning of the sole in the region subject to corns; high heels; too much removed from the frog and bars; too short shoes, which allow the foot to project over the heels of the shoe, thus giving no support to the structures above; wide feet with low heels are easily bruised, causing corns; allowing shoes to remain on the feet too long; a shoe improperly applied to the foot so as to rest upon the sole and bruise it.

SYMPTOMS OF CORNS · The dry corns usually go unnoticed. The first symptom of a moist or suppurating corn is pain. In many cases of corns in old horses the corns have existed for such a long period that the animal has become accustomed to the slight pain. However, they are restless and may paw their bedding behind at night. Sometimes the first that is noticed that may arouse suspicion of corn is that the the horse will not travel as freely as usual. Then lameness develops, which will not improve by exercise. While standing, the affected foot is advanced so as to relieve it of all weight. When a suppurating corn exists the lameness becomes severe. The hoof over the horn is hot and painful upon pressure. If a suppurating corn is neglected, pus may be seen escaping at the top of the hoof. With a suppurating corn a horse suffers the greatest pain just before the pus escapes, then goes sound after the pus is removed; lameness returns with accumulation of pus.

TREATMENT OF CORNS.—Whenever possible, remove the cause of the corn. The sole should be examined thoroughly to determine the extent and nature of the corn.

If a suppurating corn is present all the sole under-run with pus should be removed. Then apply a pack of 1-1000 bichloride and keep moist with this solution for three or four days. Then pack the corn with white lotion for three days. The horse should then be shod with a bar shoe and all pressure taken off the wall in the region of the corn..—C. L. BARNES, Colorado Agricultural College, Fort Collins.

Heaves in Horses.

Heaves is closely related to asthma in the human family. It is attended with difficulty of breathing, and a sensation of constriction in the chest. weezing generally accompanied by a cough. It is a genus of the order of spasmi. It is caused by over feeding in clover, vetches, or luceun, etc., but more particularly on chaff, dry bran and oats, and husky food, a great deal of which has generally to be eaten in order to obtain the requisite percentage of nutriment.

In countries where there is a comparatively short winter, such as in the south of France, Spain and on parts of this continent, in California, it is almost entirely unknown. Heaves is always most invariably observed to exist in proportion as clover is fed, and in order to confirm this statement is to observe that when land heretofore yielding clover has refused to produce it in paying quantities, so that other regimen has had to be supplied, it disappears. It is also caused by animals being left in the stable for several days, and during this time being fed the ordinary quantity of hay which they would have received were they at work.

Dusty hay is a great producer of heaves. Violent exercise, which unnaturally distends the lungs or an hereditary predisposition to the disease, favors its appearance. It has been considered a disease peculiar to old animals, and animals with narrow chests are most likely to be affected with it, as well as phthisis. It would be well to mention some of the prominent symptoms of the disease.

There is a duplex or double motion of the flanks when the air is being expired. There is at first a semi-collapse of the abdominal parietes, or walls. Then after an intervale, which can be easily observed, the object of which is to complete the evacuation of the chest, there is generally a short, dry, weak, slow-sounding cough, a weezing in the throat, with evident manifestations of dyspnoea. This occurs paroxysmally, and is due to violent exercise, the effects of suddenly breathing cold air, or after drinking cold water. There is also, in some patients, observed a ravious appetite, due to probable derangement of the digestive organs. Such animals do not stand work well, as the muscular tissue is soft and easily made to show the effects of fatigue. A close stable is unsuited for any horse, but particularly so for those suffering from the disease we are considering.

Treatment: Turn the animal out on pasture in the season for it. Laxative food, will relieve the complaint. In chronic cases give dry grain at night only, feed turnips, carrots, etc., at other times. The water should be given in small quantities and a little lime occasionally added. Keep the bowels always laxative, to accomplish which feed oilmeal occasionally. Give two ounces of pulverized balladonna once a week and occasionally a dose of hyoscyamus, but you will have to rely quite as much on good care and cleanliness as upon medical agents.—American Horse Breeder.

Income From Brood Mare.

In the spring of 1907 I was offered a black grade Percheron mare for $200. She was large, weighing 1465 pounds, and supposed to be with foal, but as she was well advarced in years I declined the offer.

In June of that year she dropped a fine black filly, and the next two years foaled fine black horse colts. Last fall I gladly paid $200 for the filly, weighing 1390 pounds at two years and five months. The horse colts are conservatively valued at $150 and $100, respectively, making a total of $400 in three years. As the mare and colts have been kept in a rational manner without any pampering, a large share of this sum is clear profit.

The mare was worked regularly during the spring planting, with a fortnights rest proceeding and following parturition. During the summer she had the run of a small blue grass pasture, but no grain. She was not worked regularly, but was used for cultivating corn and potatoes, raking hay, pulling the horse fork when unloading hay, etc.

The colts were weaned at about five months of age, and during their first winter they were stabled and fed hay and about four quarts of oats and bran a day. They were turned loose in a small paddock for exercise on pleasant days. After the first winter they had the run of a large blue grass pasture both summer and winter, with no shelter but a shed open to the east, in which was a large manger always filled with bright mixed hay.

During the summer two-year-old steers are grazed and fattened on this pasture, and great care has always been exercised to prevent close cropping of the grass, so there is an abundance of good winter pasturage for the colts, and they eat very little hay except during deep snows.

The mare runs in the pasture with the colts during the winter season and in the spring is in better health and flesh than in former years, when she was wintered in the barn and was grained and worked regularly.

This method has resulted in the raising of large, robust colts, full of vitality and constitutional vigor, at a minimum cost. In this way many an old mare will prove a mine of profit for her owner, provided she is of the proper type and size to produce draft colts, and is mated to a good stallion.

C. B. WADE.

Horse Notes.

Early education for the colts; nothing is like it.

Rapid walking is the first gate to teach a colt.

After all, what good ever comes from shouting and swearing at the horses?

A horse owner was once grumbling about how his team always kept thin no matter what tonics he gave them. A stableboy close at hand said: "Mister, did you ever try oats?" There is a suggestion here for some men we know of.

Prepare the colts for their first spring's work by a fairly liberal grain ration from now on, combined with plenty of work on the sleigh and a run out of doors every day.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink Eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.

E. J. ANDERSON.

BEAR RIVER, N. S.

DEAR SIRS,—

We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.

Yours truly,

CLARKE BROS.

FREE—FARM ACCOUNT BOOK

Know How Much You Make This Year

No one shall pay a cent for **Bickmore's Farm Account Book.** It will be sent free to any farmer who will be good enough to tell who and where he is. The cost of a crop never demanded closer attention. Business farming puts money in the bank. This book is arranged to keep all accounts in simple form—more simple, and certainly more practical, than trying to remember them; shows what to charge against crop production; has a laborer's time record; and section for personal accounts. **64 pages; for ink or pencil.** Not a cheap affair. It is meant for business. Its quality is in keeping with

BICKMORE'S FARM ACCOUNT BOOK

POULTRY.

The Principles and Practice of Poultry Breeding.

(Continued from last issue.)

THE PRINCIPLES OF BREEDING.

Heredity. Only a little experience in breeding poultry is sufficient to convince the breeder that heredity both helps and hinders his operations. He learns in a very practical way that he has to reckon with the certainty of the inheritance of faults as well as desirable qualities of parents by the offspring.

Heredity has been defined as "the inheritance by the offspring of the characters of the parents, at the time of procreation." The parents repeat themselves in their descendants.

Of all the qualities of the parents transmitted to their offspring a portion only are apparent to our senses. Other characteristics are not so evident or escape our means of observation.

To explain the degrees of conspicuousness of parental characteristics in the offspring two terms have been used —dominant and latent. Dominant characters are those which are very apparent in the offspring. Latent characters are such as apparently disappear, become obscured or hidden from our observation. Dominant characters in one generation may become latent in the offspring of a later generations, latent characterf may reapear after ohe or more generations, sometimes becoming dominant.

In the mingling of the parental qualities in different offspring of the same parentage, there is never the same arrangement of dominant and latent characters. No two chicks of the same parentage are exactly alike. There is a rearrangement each time, which brings out qualities more or less dominant or conspicuous and the combination gives to each offspring its own individuality.

Atavism. If characters become dominant which were latent in the parents but apparent in a previous generation there is said to be a reversion or "throwing back." The offspring inherits through the parents some evident characteristic quality of a grandparent or of some more ancient ancestor. The scientific term of this form of Heredity is Atavism (from a Latin worn meaning ancestor).

Here is one of the dangers of the ambitious poultry breeder. He seeks to make rapid progress. He wishes to advance continuously and swiftly in perfecting his pets. He makes matings of birds uniting the characteristics which he most desires to develop in his chicks. In so doing he, perhaps, brings together birds possessing some strong opposing characteristics. Instead of commingling their characters to produce the desired composite chick their dominant characters disappear and a long latent character of the original type of the breed or of some almost forgotten ancestor becomes dominant in the progeny.

The cautious, careful, conservative poultry breeder makes haste slowly and avoids these breaks in breeding which arise because of the action of Atavism.

Prepotency. The poultryman who patiently persists in selecting and mating together his very best birds, with the definite and decided purpose to improve certain characteristics, finds that, instead of throwing back, the offspring strike forward. Pairing together two fowls of like good quality, if they do not possess antagonistic qualities or powers, usually insures the development of the good quality in the offspring to a greater degree than was apparent in either of the parents.

By mating together birds of similar excellent qualities the power of transmitting those qualities also is usually increased. By continuing this process generation after generation, in a strain of fowls, the valuable quality becomes more and more a distinguishing characteristic of the family.

In pursuing such a policy, there are sure to arise among the progeny, individual birds, which not only possess the desirable good quality but also show increased and certain power of transmitting the quality to their get. They are prepotent, i. e. very powerful in this respect. Such special, emphatic power is a very valuable possession and the poultryman should cherish such birds as of more than usual value in his breeding pens.

A prepotent male or female fowl may transmit prepotent quality to successive generations and numerous descendents so that, in the course of time, it becomes the leading characteristic of a variety or breed of poultry.

Prepotency in the transmission of certain valuable characters is the quality which causes pure-bred male birds to be purchased so extensively for use in crossing upon common farm fowls for the improvement of the latter.

Because a bird is pure-bred, however, one should not conclude that it is necessarily and always prepotent. There are degrees in prepotency. More than one bird of good pedigree has proved that its family characteristic of prepotency may become latent. Actual testing of a bird by use in breeding, will alone decide what degree of prepotency is possessed. When a bird is found to be especially prepotent in transmitting to progeny a certain desirable quality, such as large egg-production, rapid growth, early maturity, easy fattening; typical plumage, etc., such birds should be carefully controlled and kept for breeding as long as practically possible. The possession of a very useful quality and of prepotency in its transmission to offspring is the most valuable combination in poultry breeding.

(Continued next issue).

Hatching Chicks with Incubators.

EDITOR MARITIME FARMER.

Farmers are conservative in taking up new ideas; conservative in buying new things. They have to be. Nevertheless, when they see prospective profits oozing through the safety value of a new or improved implement, they feel that they must have it, even if they have to give a note for it, or encumber their farm with a new mortgage.

That's farm progress, which interpreted signifies prosperity on the farm.

No farm can be complete, no farmer can be superlatively prosperous where progress in labor—saving equipment is ignored. And this applies as well to incubators as to any other implement.

Where not many years ago nine out of ten farms had never heard of an incubator, to-day the word is passing from farm to farm that the profits are larger, the work less onerous, the hatches more sure, and the hens are taking fewer holidays, laying more eggs; not all on account of incubators, but primarily on account of the incubator, and secondarily on account of the large amount of book knowledge distributed with it. The farmer's wife is doing her share in the profit-making. She always has done it; but now she is gaining recognition as a partner in the business. This is having, it has had, its effect, and the result is, farmers are now posted on poultry profits. They will continue to be posted; and those who have been operating incubators will go back to hen-incubation only when they return to the old custom of treading out the grain with oxen—only when they are prepared to put the cream separator on the shelf.

Poultrymen who are in the business commercially, whose living depends upon the profits, would as soon think of threshing the grain with an old-time flail, as they would of hatching chicks or ducklings with hens or ducks. The thought would be absurd. Without the incubator they would have to go out of business.

Before the introduction of incubators large commercial poultry plants were an impossibility. Mr. James Rankin gets the credit of putting the first lot of ducklings and broilers on the market in considerable numbers, and making it pay. But James Rankin's only salvation was the invention of an incubator. Without its aid he found he could not make a business of raising poultry for market at a profit; so he made one.

That was many years ago. The incubator of to-day has improved as time has rolled on, and—but no more need be said regarding the future of the incubator (the built-to-hatch incubator) in the poultry business. Hens will continue to be used where only a dozen or two chickens are intended to be kept for home use; but on the farm where chickens can be fed cheaply and are raised by fifties or hundreds, the time-saving incubator, the economic method will be-is-adopted.

The farmer and his wife sometimes face a disconcerting situation when they have finally decided that they wish to get more of the poultry profits by buying an incubator. The question arises "Which incubator shall I buy?"

I may not advise them here except generally.

There are a number of good incubators on the market; and there are a number of built-to-sell machines that the farmer cannot afford to experiment with; but the present day farmer has his eye teeth cut and knows he cannot get something for nothing. To be successful in raising poultry one must use business-like methods with business-like equipment.

In buying an incubator go about it in the same way you would if you were buying any other agricultural implement. I might advise again and again, but I cannot give better advice than that. Think it over; and be as particular as you would in trading horses.

Mr. Editor: When you personally know of poultry plants each using from 50 to 100 incubators; of plants hatching 40,000 duckings in a single season; of fanciers hatching their New York, Chicago, and Boston winners in incubators, and raising them in brooders, there's not much left for me to say. It is not evidence of the utility of incubators that is wanted, because anybody can get that in any down-to-date incubator manufacturer's catalogue—evidence on the size of the poultry business; on the profit in the business on the decadence of "mother" hen (unless the hen that lays the eggs is the mother); and the coming-into-her-own of the hen that never could be

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Ordeal; or, the Spring and Mid-Summer of a Life.

(Continued from last issue.)

It was a soft evening in early summer, just such an evening as the one, ten years before, when, for the first and last time, an arm that was not her father's and not her brother's, had encircled her. Something in the perfume of the flowers had recalled it vividly. A sharp pang of hope unfulfilled, a thought of a dreary, lonely future came with it. Ten years now since even the most casual intelligence had reached her, the election of Carrol Austin to the professorship of a Western college, a newspaper mention such as had told her of his ordination. But there was "fuel," in spite of Mr. Bradstreet's comfortable conclusion the remembrance of that winter, the knowledge that he was steadily and successfully pursuing his course, and above all, a deeper appreciation of the truthfulness, and honor, and utter self-sacrifice that had resigned her.

"Oh, did you speak, Lucy? Who? I really don't know. Some literary man and his wife, I believe, quite out of Hal's usual line. He's written a moral philosophy, or something of that sort, that they are going to adopt in college. I don't see why, I'm sure, when every one knows Dr. Cogshall's is the best text-book in the English language. Like everything else, though; can't be satisfied without this continual change."

So Miss Bradstreet made her simple toilet for her brother's dinner, without the slightest curiosity or even interest in his guests, and entered the dining-room rather late, to be presented to Prof. Austin!

"I took very good care not to tell her it was you, Carrol," said Henry Bradstreet, who was highly delighted with meeting "the friend of his youth." "She's a maiden aunt, you know, but a pretty good girl still—walks after the old gentleman and makes his tea in the most dutiful manner possible."

So he was married; her father had said his wife was to be there. Something had prevented it, for the rest were familiar faces; she would not ask what, for a dreary, benumbing feeling came over her. She had not looked for this as the end of her vigil; but it was human nature, and she had no right to expect anything different, when his last words had been—"No, Lucy, you must not say so; you are quite free!" She did not acknowledge what had kept her love alive, and how keen the blast that had quenched it. She thought it was faith in human nature that had suddenly been darkened; and she listened, and replied, and was courteous, even gay, in her bearing through all that long, beautiful, wearying dinner.

She stood before the coffee-tray in the drawing-room, at her sister-in-law's request, when the gentlemen came from the table. It was a relief to have something to do, a shelter from the few words that must pass between them. She could not help seeing that manhood had developed the once slender figure into full and noble outlines, that the fair hair was thinned about his white temples, that he spoke with a deeper thought and utterance. There was no disappointment in time's work She wondered if he thought her changed. She had found a gray hair two weeks ago! She was conscious of the sedate and thoughtful face that looked out from her mirror to her—that youth was over, and its illusions, alas!

"You do not ask for my mother, Miss Bradstreet." She started, for Mr. Austin had come directly to her. "My mother has not forgotten you, however."

"I have been remiss. I remember her distinctly." How often had that one meeting been lived over! and how firmly was the remembrance united to his! "She is well, I hope."

"Yes, and making my home happy, though she is a grandmother now, and my sisters steal her away sometimes."

"And Mrs. Austin—she is not with you to-day? You take no sugar, if I remember." For all her self-restraint, the delicate Sevres cup trembled in her hand.

"Mrs. Austin?—oh, my brother Ben is much too fickle to think of marriage even; even if he were old enough. He has more flames than our old friend Miss Perkins used to boast of."

"You misunderstand me. My father led me to suppose that I should meet Mrs. Carrol Austin here to-day."

"No, Lucy, forgive me, not unless he has withdrawn the old denial, not unless I am speaking to her now!" And, as in the old, old times, their eyes met, for the first that day; hers with sudden questioning, and his with a fond though reproachful look.

But they separated again without betrothal, unless a fuller and more perfect knowledge of the hearts and lives of each other formed it. Not that Mr. Bradstreet again denied his daughter's hand, she herself pointed out to her friend how impossible it would be to leave him, now that the habit and usage of a lifetime had made him dependent upon her for comfort and happiness. But their separation was not in utter silence as heretofore, and Lucy learned, by the history of his growing honor and usefulness, that, even in this world, "he that forsaketh houses and lands, for his Master's sake, shall receive an hundred fold."

The day came at last when she saw the Western home of which he had so often written. It was to be hers henceforth, all that she could claim, for her father's house was already occupied by strangers, and her cares for him were ended. Almost half her lifetime had passed since she gave the promise she had so faithfully kept, and the frail figure that came forth to welcome her was already bowed with advancing age. The brown hair was changed to silver, the face full of that repose which overshadows those who dwell in the land of Beulah, awaiting the messenger of the King, and her kiss was like a benediction, when she folded the daughter she had so yearned over, in her arms.

Mrs. Austin had seen her life-work well rewarded, despite many changes, many crosses, and more than one bitter disappointment; and now that her son's home was brightened and his youth renewed with the accomplishment of all it had desired, she could fold her hands tranquilly, and say—"It is enough; now lettest Thou Thy servant depart in peace."

(THE END.)

To Yield, or Not to Yield? That is the Question.

Mrs Mortimer was one of those old ladies with whom we sometimes meet, a sort of "mother to everybody," whose good sense and kindness of heart make us forget that she is old, but invite our confidence, make her a welcome guest in our family, and whose rebukes we receive as "an excellent oil." This is what Mrs. Mortimer was; who she was is of no consequence. It will matter little who we are, when we stand at the court of Heaven; but what we are will be a question of momentous interest.

Mrs. Mortimer came to spend some days in the family of Mrs. Sabin, a frank-hearted little lady, who had a high idea of her "rights," and no small determination to maintain them. She was an "oldest daughter," had always had "her own way," was long the acknowledged governess of several younger sisters, and it is hardly strange that she had come to have an imperious little will, which never showed its power more than in the question which she often propounded to her husband, to wit: "Do you think it is a wife's duty always to yield?" Indeed, this was asked so often, it was evident that the true sentiment was, "I think a wife ought never to be asked to yield a point upon which her heart is set."

Mrs. Mortimer had been with her but a few days, when, entering her room one morning, after Mr. Sabin had left for his daily duties, she found her young friend weeping. She said nothing, as Mrs. Sabin hastily dried her tears; but, suspecting the cause, she determined to interefere a little in her domestic relations, as few could do without the almost certain prospect of making a bad matter worse. It was but the work of few moments to draw out her impulsive young friend; and, hoping for sympathy but hardly thinking she needed counsel, she thus made her grievances known:—

"I want my husband to love me as he once appeared to. Once, his language was full of endearment; but he has grown reserved, and, though he never speaks unkindly, he seldom greets me with a kiss, and every day I want something which he refuses me. I am sure I try to be a good wife, but I have lost all my influence with him, and my opinion and wishes seem to be of no account. I wonder if all husbands begin to lose their love as soon as they are married?" And a fresh burst of tears concluded the paragraph.

Mrs. Mortimer waited till she became calm, when she asked: "My dear, did you ever ask yourself what your highest motives for wishing your husband to love you?"

This was a new train of thought.

"Why," said she, hesitating, "everybody wants to be loved."

"Very true," said the old lady, "but for very different reasons. I know one lady who wants her husband and others to love her simply for the happiness flowing from mutual affection; and I know another whose strongest motive—though she is all unconscious of it—is, that he may yield to her wishes in all things, and make it the highest business of his life to gratify all her demands. Need I add that, while the husband of the former has come to think his wife an angel in the flesh, the latter can see little evidence that she is loved at all?"

This brought out Mrs. Sabin's fundamental idea: "Do you think it is a wife's duty always to yield?"

"I will not say whether it is her 'duty', or her privilege, or her policy, though it may be, in the broadest sense, all. If husband and wife are 'one,' there cannot be opposing powers. That destroys the oneness, and with it the sacredness and happiness of the marriage relation. God has made man the strongest physically; the laws—whether right or wrong—make him the strongest socially and pecuniarily; his sphere gives him the best means of judging of men and motives; and the Bible treats him as the head and ruler of his household. I know that, in this age of 'woman's rights,' the justice of these things is called in question, but I take neither side of the agument; I look at facts as they exist. As a matter of fact, the woman's 'power' is not equal to the man's. The men believe this is right. I do not know but it is; and though they often abuse their power, it may be yet the lesser of two evils, for I am not quite sure that we should prove ourselves any better able to govern justly and wisely than they. You ask if a wife should always yield. I will only say, as a matter of fact, paradoxical as it may seem, those wives who yield the most implicitly rule the most imperiously they do so because they bind their husbands' hearts with stronger cords than those which bound Samson—cords of love, which makes them anxious to gratify every wish, if proper and possible. This result is not because of the wife's 'submission', but because it shows a confidence in his judgement, a respect for his character, and a gentleness of soul which no man who is a man can resist. On the other hand, every time the wife sets up her will against his, and shows a determination to worry him into a compliance with her wishes, against his judgment, by teasing, fretting, or otherwise, or yields only because his will and his power are the strongers, she sunders one of those cords, and may, in a little while, crush out all of his affection, with agonies to him worse than death. As least, this is the conclusion to which I have come, after a long life and a sad experience of my own. I have suffered, but by Divine grace—I was led to see my error before I had quite made a wreck of all happiness. When I had almost weaned my husband's last yearnings of love, I made him, as I said, by Divine grace—for I could not have done it alone—again the devoted lover; and I enjoyed a second honeymoon, that lasted till I saw his spirit depart, prepared, as he was, for the higher duties of a holier world."

The old lady slowly removed her spectacles, to wipe a tear from her eye, and continued:—

"I will tell you some of my history, though it brings up some bitter memories. But that is nothing, if others can benefit by my experience.

"I am not what I once was, nor is the world what it once was to me. But, oh, the struggle that this change cost me! Yet the victory was worth it all. I was a spoiled child; I did not know it then—few of my friends knew it. It was a severe experience that

WANTS HER LETTER PUBLISHED

For Benefit of Women who Suffer from Female Ills

Minneapolis, Minn.—"I was a great sufferer from female troubles which caused a weakness and broken down condition of the system. I read so much of what Lydia E. Pinkham's Vegetable Compound had done for other suffering women I felt sure it would help me, and I must say it did help me wonderfully. My pains all left me, I grew stronger, and within three months I was a perfectly well woman.

"I want this letter made public to show the benefit women may derive from Lydia E. Pinkham's Vegetable Compound."—Mrs. JOHN G. MOLDAN, 2115 Second St., North, Minneapolis, Minn.

Thousands of unsolicited and genuine testimonials like the above prove the efficiency of Lydia E. Pinkham's Vegetable Compound, which is made exclusively from roots and herbs.

Women who suffer from those distressing ills peculiar to their sex should not lose sight of these facts or doubt the ability of Lydia E. Pinkham's Vegetable Compound to restore their health.

If you want special advice write to Mrs. Pinkham, at Lynn, Mass. She will treat your letter as strictly confidential. For 20 years she has been helping sick women in this way, free of charge. Don't hesitate—write at once.

taught it to me. I had an affectionate disposition, all my wishes were gratified, and I thought they always should be. Self-denial was a lesson I had never thought of learning, and no one knew the strength of my unbroken will, because it was so little resisted. I was poor, but had no idea of the value of money, except to spend for the first thing my fancy coveted. If a dollar was all I possessed, I would have shared it with a friend for the first gratification that presented; and if my desires were ungratified, it was only because they must be, and that was not self-denial. Thus others were almost as much decived in me as I was in myself. They thought me wholly unselffish, and little dreamed that I had hid away in my heart a self-will that never slept.

"Thus I lived on, in that sense unknowing and unknown, till Mr. Mortimer offered me his hand. He had lost a wife, not many years before, whom he almost adored, and he promised me the same devotion he had given her. I had know her intimately, and I felt that if I could be loved as she was, I should be satisfied. He appeared devoted to me, and I became his wife, hoping to fill the place of the last one in his heart. I thought I wanted to restore happiness to his heart, and did not dream how much self had to do with my plans. He had property, and I felt that, in marryiug me, he gave me, not only legally, but morally, an equal right to it, and was able to support me genteelly—that is, in a style equal to anybody else. It was the same to me as though I had toiled with him in its acquisition. I forgot the years in which he had struggled and sacrificed his personal comfort, and that his first companion had practised self-denial, in obtaining it. I only considered that money was good for nothing but to spend and enjoy. I believed, though mistakenly, that he could afford to grant all my desires; and when I made my wishes known, it it was with a tone, if not in the words, of demand; and though I accomplished my purpose often by teasing and worrying him till he yielded, contrary to his judgment, I little dreamed how dearly was my victory bought. How could he but despise me, when I gave him every reason to think that I loved his money quite as much as I did him, and claimed greater rights to it than did the lost one whose economy and love helped him earn it? I thought not of these things, but believed he was bound to gratify and love me, whether I showed myself lovely or not.

"If we differ in opinion, I could not believe that his superior experience and knowledge of the world ought to make him the most competent judge; so I never yielded my judgement to his. Yielding in opinion was as unnatural to me as yielding in conduct. My husbsnd say that I had no respect for his understanding, but considered my own opinion infallible.

"I knew it was necessary for the wife of a poor man to work; but thought the wife of one above want had a right to enjoy life according to her station, and that, if I did anything that could be regarded as 'labor,' my husband ought to pay me as much as it would cost to hire it done by menial hands, that I might have something to spend for things he was not willing to furnish me. Thus, to enjoy my opinions—or to maintain them, for I found no enjoyment in the victory—to have my own will, and to accomplish my own ends, I was willing, unconsciously, to cut myself off from my husband's sympathies, and, while claiming to be one with and equal to him, and entitled to a wife's respect and love, I degraded myself in his eyes to the level of a mere mercenary housekeeper, striving to drive the best bargain I could with him, and obtain all the favors, under the claim of 'rights,' that I could from him.

"I saw his love declining, and, in my heart—sometimes in words—I reproach-him for it. I thought his love was my due, without any demand upon me for respect to his wishes, confidence in his understanding, or surrender of my will to his. He became melancholy, shunning society, under the plea of business, and rarely greeted me with a kiss or a sign of endearment. At length, he was taken sick. He came home, and lay down upon the sofa, and I asked what was the matter. The mournful answer was: 'I am sad, sick, and weary!' No more was said; but my heart told me something of the meaning of his words, though I little dreamed that his sickness was more from anguish of spirit than any other cause. I felt that there was a wide gulf between us, but could not believe that I was at all responsible for it, or had power to heal the breach.

"We were mutually unhappy; and one evening, when he was better, after we had retired, with no kiss of loving words, I was impelled to ask him: 'Do you love me?' Several times I repeated the question, with no answer, till, at length, he exclaimed, with deep emotion:—

" 'Oh, how I would love you if you would let me! I could love you with perfect devotion, but you perfer your own will to your husband's love. You despise him, or his judgment would secure some respect; you love him not, or his wishes would have some weight; you disregard his experience and deny him any authority as the God-appointed head of the household, and all control in domestic affairs, except as he becomes subservient, usurp his place and deny his right to control his own business, and are fast crushing out the last breath of that deep affection which he longs to lavish upon you.'

"I was disposed to be angry, and put myself upon a defence, for I could not believe I deserved such reproaches; and my first plea was to ask him the verv question which you have put to me, and which has induced me to tell you my sad story; 'Do you think it a wife's duty always to yield?'

" 'I do not ask you to yield,' said he. 'Stand to your rights, and defend them from that citadel of your will that never surrendered; but think not to win a husband's love by reproaches; his caresses by complaints; or his respect by contempt. You may yet make him a devoted lover, or you have little more to do to leave before him only the prospect of a cold and cheerless life of duty, as the mere guardian of one he would enshrine in his inner heart if he could!'

"I need not tell you, my dear friend, that my pillow was drenched with tears. He said no more, and I might have supposed him sleeping, but for an occasional sigh, such only as a man in his agony could give. Nor need I tell you, I trust, that, when I became calm, I made that night a night of solemn review. My pride was humbled; I began to look at things as they were; my heart told me his bitter words were too true, and, for the first time in my life, I truly believe, I pronouneed judgment against myself. It was all plain,—plainer than he had expressed, or than I could express it; and, in those silent, solemn hours, I resolved, before my Maker, that my will should be subdued, and, right or wrong, with a view to the highest good, my husband's judgment should in all things be mine. But think not that my will, unsubdued for nearly thirty years, was conquered by a mere resolution. Deep, often, were my struggles, and terrible the conflict in my breast. I could but often feel that I was yielding my rights; but even this was scarcely as hard as cheerfully to yield my desires. But I resolved it should be done, and, bringing my will to make war upon itself, I began the conflict. I made my husband no promises, but he soon saw my efforts and appreciated them. It was strange to see how soon his eye began to light up with hope.

"My change was, at first, mostly the result of mere determination; but, by degrees, my heart and inclination came to accord with it. My husband's smile was at first with a look of fear that my change would not last; but, in a little while, he was as happy as he was devoted to me. I was changed. The lesson was never forgotten. He saw that I had conquered myself, and I had no more cause to ask if he loved me, for the accents of endearment were continually upon his tongue. I found that, in yielding all, I had gained all. I had no wish ungratified, for it was his wish to gratify me, and I had learned to limit my wishes to the decisions of his judgment. I had subdued myself, and become the gentle, confiding wife, respecting my husband as I had never done before. Thus we lived, with unalloyed happiness, till he was called away to a better world, where, with his former companion, he waits for me, and where, by Divine grace, I expeet ere long to go.

"This is my experience, and it has taught me that the wife who 'rules her husband' cannot respect him, and he cannot love her, except, perhaps, in those rare unions where he has a very weak mind, and she really a very strong one. In such a case, the order of things may be reversed."

Thus the kind old lady closed her story; and Mrs. Sabin, with a tearful eye, like one of old, "kept all her sayings, and pondered them in her heart." Whether the true philosophy of connubial felicity was developed in her history our fair reader will judge.

A WONDERFUL REMEDY

Orange Lily is daily curing the most obstinate cases of Female Disorders. Falling of the Womb, Leucorrhoea, Painful and Suppressed Menstruation, etc., etc., are all of them relieved from the start by its use, and a few weeks' or months' treatment accomplishes a complete cure. This remedy is a positive, scientific preparation, and is based on the discoveries of Pasteur and Lister. It is an applied treatment; that is, it is not taken internally, but is applied direct to the suffering parts, and it, therefore, acts with all the certainty of the known laws of chemical action. As it comes in direct contact with the diseased tissue, its antiseptic and nerve-food properties cannot help have a beneficent influence. I receive from 10 to 50 letters daily, speaking of the benefits and cures it is performing, and so sure am I that it will do what is claimed for it that I will send, absolutely free, a 35c box to every suffering woman who will write for it. Price, $1 per box, which is sufficient for one months' treatment. Address, MRS. FRANCES E. CURRAH, WINDSOR, ONT. 3

Work in Happiness.

I was visiting a good woman one day when she showed me a photo of her younger brother, a tall, strong fellow of about thirty-five. She remarked with pride: "He's retired now. He doesn't have to work any more. He sold his farm and just lives on his money." She seemed very pround of the fact, as if a farm and the work thereto was something abhorred. Now I differed, so I had curiosity enough to ask: "Indeed, and is he happy now he has nothing to do?" "Well," she replied, "he ought to be, but he says he wishes he was back on the farm." I thought, isn't it also on account or our wrong ideas and ideals. We don't realize that to work at whatever is our lot is the only way to be happy. Since the decree sent Adam to work in the garden, it has been man's greatest pleasure as well as necessity to work and enjoy the use of his powers. To use one's brain and hands normally is more pleasure than to sit with them dormant. So many men work to save enough to retire on, and then when the time comes and they retire, they are dull and unhappy, and realize all too late that one must take the happiness along with one's work and live as he goes along. Joy is not a thing we can put away in a bank to be drawn out in the future.

Eating an Apple.

"Do you know what you are eating?" said the doctor to a girl.

"You are eating," said the doctor, "albumen, sugar, gum, malic acid, gallic acid, fiber, water and phosphorus."

"I hope those things are good. They sound alarming."

"Nothing could be better. You ate, I observe, rather too much meat at dinner. The malic acid of apples neutralizes the excess of chalky matter caused by too much meat, and thereby helps to keep you young. Apples are good for your complexion; their acids drive out the noxious matters which cause skin eruptions.

"They are good for your brain, which those same noxious matters, if retained, render sluggish. Moreover, the acids of the apple diminish the acidity of the stomach that comes with some forms of indigestion. The phosphorus, of which apples contain a larger percentage than any other fruit or vegetables, renews the essential nervous matter of the brain and spinal column.

"Oh, the ancients were not wrong when they esteemed the apple the food of the gods, the magic renewer of youth to which the gods resorted when they felt themselves growing old and feeble. I think I'll have an apple," concluded the doctor.—Ex.

Origin of the Blue Wedgewood.

EDITOR MARITIME FARMER:

How many people know that the beautiful blue wedgewood sugar bowl, cream pitcher, pin trays, mugs and other articles, too numerous to mention, were first invented and manufactured by a poor cripple, called Josiah Wedgewood? Perhaps a short narrative concerning him and his ware would be interesting.

He was the thirteenth son of a potter, who owned a little pottery, that stood in his back yard. When Josiah was nine years old, his father died, leaving what little he had to his eldest son, Thomas. This was a severe blow to the already overworked mother. About this time a very malignant type of small pox broke out and for weeks little Josiah hovered between life and death. Finally he began to recover, but the settling of the disease, in the lower part of one leg, and the eventual amputation, made him a cripple for life. His face was also horribly spoiled, pox marks standing out like moles. His affliction gave him a very sensitive nature. It sent his mind inward and in after years it drove him to meditate upon the laws and secrets of his art. So while other boys of his size were frolicking through the streets of the little village of Burslem, where they lived, he was learning the three R's from his mother, who was an educated and refined woman.

It is said his mother gave him his first inspiration for fancy pottery by writing his name in clay. Years after, he relates, that he copied it a hundred times a day for a week, writing with a stick in the mud. In a record of that long illness and mutilation of the boy, we are told that he often repeated: "If I cannot work with my feet, I will with my head," and he did. When Josiah was fourteen years old, he could write better than his mother or any member of the family, and his education was considered complete.

At this age he was bound over to his brother, Thomas, for five years, but his frail form could not stand the work and confinement, so he was again taken ill. It was about this time that Richard Wedgewood, his uncle, came over from Cheshire on horse back to see them and behind him, seated on a pillion, was his only daughter, Sarah. In the kitchen, propped up on a bench, with his lame leg stretched out before him, sat Josiah, pale, wan and woefully pitted with ugly purple marks. The girl was at once aroused to pity and gave him a book to read. Of course he was foolish enough to fall head over heels in love with her at once; but in after years she proved to be his guiding star. Thus is the old saying of Emmerson verified, "Hitch your wagon to the stars." When he recovered and got to work again, he did not make brown butter crocks and stone jars all of the time, but began to experiment with new clays, colors and glazes, making many beautiful things to send his cousin Sarah. Poor Josiah chaffed under the chiding of his brother, who knew no way to succeed save to stick to the old way.

At nineteen his apprenticeship expired and in a diary, still preserved by his decendents he says: "I have my trade, a lame leg, the marks of small pox. I was never good looking, anyway." His brother, taking note of his ability and art, would not let him go, claiming the legal guardianship over him until he was of age.

He had safely turned his twenty-first year before he decided to go and visit his uncle; but down deep in his heart, it was to see the young girl, of whom he had been dreaming for years. On arriving in Cheshire he did not find the little girl, who rode over on horse back to see them, but a beautiful young lady—a dream of grace and beauty. He was more than ever conscious of his limping and his marked face. On the whole, he was very uncomfortable and miserable. This feeling, however, wore off in a few days and returning to Burslem, resolved to break away from his brother and get into business for himself. This awkward, homely cripple loved the beautiful Sarah—her life to

him was a great living presence and all his plans for the future were made with her in mind.

He invented a mill to grind stone, experimented with the different kinds of rock and became a skilled modeller. In a year he had saved a hundred pounds, which seemed quite a fortune. Sarah wrote him: "I am so proud of you; we all predict for you a great future." Such assurance gave him courage and we find him immediately setting out for Cheshire, to call on Squire Wedgewood on very important business. Of course we will not tell the reader what that business was. Just let it go that the Squire told him he was a great fool to expect his daughter to marry a poor, homely, lame potter. The girl would one day be worth ten thousand pounds and the man she married must match her dowery. Poor Josiah's assurance was exhausted; he turned white, then red, could think of nothing to say, so he stumbled out and away as quickly as possible. He did not even wait to say good-bye to Sarah, who had hidden herself in a closet to hear what her father would say. His first inclination was to find out where the river was, that there might be one potter less. He had not gone far, however, when a vision in blue appeared, running across the meadow. "Oh, Josiah," she cried, "You can match my dowery—try, you can do it—I will wait," and giving him her hand, which he twisted and wrung most unmercifully for a moment, was gone. Needless to say this gave him new courage and from that moment he was a man among men, something more than a lame, homely potter. He studied, worked and evolved, and became the most famous potter in all England. It seemed a long up-hill task, but he must make the money somehow. Finally his business began to increase, his bank account to swell into the thousands. He was thirty years old, with nearly the magic sum. Sarah sent three cheering letters every week, for ten long years, and he as many in return. The old postman got many a tip from both and Sarah often sent him a mile out of the village, because her father had made a hard and fast law that one letter a week must suffice.

When Josiah was thirty-four and Sarah twenty-nine, the desired amount had been realized and it is said they walked over to the little village of Astbury and were quietly married, the sole witnesses being the Rector's family and the old postman, who had played such an important part in their lives.

One year after marriage, a little daughter was born and they called her Susanna, after his mother. Susanna grew up and became the mother of Darwin, the great scientist.

Wedgewood, toward the close of his life, was regarded as the richest man in England, who had made his own fortune. In speaking of his wife, said: "I worked for her approval and without her faith in me, I realize that my physical misfortune would have overcome my will and failure would have been written large, where now success is stamped."—FARMER'S WIFE, Andover, N. B.

First Aid in Letter-Writing.

There are doubtless many busy women, like myself, who have numerous friends and relations, living at a distance, with whom they are expected to keep up a correspondence. I used to be so tired when I finally found time for letter-writing that I could scarcely think of anything to write about. Now I keep a pad and pencil lying in a convenient place, and while about my work if something suggests itself to me, I jot down a word or two—enough to bring it back to my mind when I am ready to write.

The result is, that instead of just a greeting and an adieu, with comment on the weather and the health of the family spread over the space between, my friends receive bright, newsy letters and I have the satisfaction of knowing that I have not sent out an epistle that I am ashamed of, but the kind I should wish to receive myself, which is the real test in this as in many other things.

HITCH YOUR HORSES TO The "Bissell."

The horses hitch close to the work, giving the "Bissell" light draft. You sit well back, the seat being balanced so that it removes all neck weight. The dust proof ball bearings still further decrease the draft. The "Bissell" is by far the easiest on the horses. It pulverizes the soil the best, too. The shape of the plates enables them to easily enter the toughest soil. They turn clean furrows. The cleaners draw to the plates and meet them chisel fashion. They cannot be forced away from the plates, but cut right through the dirt, fibre and grass and keep the plates free. The "Bissell" is solidly braced and cannot be beaten for rigidity and strength. It takes skill and experience to build a harrow like the "Bissell." It has taken us about a score of years to bring it to its present perfection. Other harrows may look like the "Bissell" but a field test will prove it twice as good an investment. We ask you to make the test. Ask your local dealer to show you the "Bissell" or write to Dept. M. for catalog.

What Was it.

Guess what he had in his pocket:
Marbles and tops and sundry toys
Such as always belong to boys.
A bitter apple, a leather ball?
Not at all.

What did he have in his pocket?
A bubble pipe and a rusty screw,
A brass watch key broken in two,
A fishhook in a tangle of string?
No such a thing.

What did he have in, his pocket?
Gingerbread crumbs, a whistle he made,
Buttons, a knife with a broken blade,
A nail or two, or a rubber gun?—
No; not one.

What did he have in his pocket?
Before he knew it slyly crept
Uundr the treasures carefully kept,
And away they all of them quickly went.
'Twas a hole.

Discouraged Brother.

Say, brother, what's your trouble?
Ain't the old world used you right?
Look as though you'd give up hopin' 's
though you'd lost the heart to fight;
Have you found out that it's useless to
expect to stand ashow?
If so, tell me how you've done it—tell
me how you reely know.

Ain't you gettin' what you're earnin'?
Can't you find no work to do?
Have you got to thinkin' mebby God
has got it in for you?
S'pose you've got a sort of notion you'd
be way up in advance
With the winners if you'd only had
some other fellow's chance.

Come, now brother, let's be honest—
let's gid right down to bed rock;
Don't you, when you'er workin,' always keep a-lookin' at the clock?
Don't you just do what you have to, in
a slip-shod sort of way—
Not because you like to do it, but because you want the pay?

Yes, I thought so! You've a notion
you've been cheated, hain't you,
now?
Got a sort of dark suspicion everything
is wrong, somehow;
Think the world owes you a livin' and
has tried to shirk its debt—
When it rains you want dry weather,
when it's dry you want it wet.

Have you ever stopped to wonder why
the world should ever care
Whether you are feelin' happy or are
clingin' to despair?
Have you riz to such importance that
its likely anyone
Can be feelin' jealous of you or belittle
what you've done?

Guess the trouble with you, brother, is
you just don't care to try,
And you think the sun quits shinin'
when a speck gits in your eye;
Mabby things would look some brighter
if you'd give up findin' fault
And git all your pores well opened while
you tried to earn your salt.
—S E. KISER, in Chicago Record-Herald.

Only for Women.

The wives of farmers perhaps wrinkle at an earlier age than any other class of women. Their incessant daylight duties prevent them from giving much attention to their own personal appearance, and after the day's work is accomplished some of the hours which should be devoted to refreshing sleep are spent ageing plans for the morrow. My unenviable experience as a farmer's assistant has placed me in close sympathy with this necessarily industrious, but self neglected band of women and for this reason I am always on the alert for something that will be of practical benefit to the toiling country madam or maiden. The majority of these have the pure air, the wholesome food, and limpid water which are essential to the health, and I now give two simple, time-proved formulas for either restoring or preserving the good looks. Both were used by belles of the eighteenth century, and are of unquestionable merit. Slowly distill equal parts of house-leek and celandine and apply to the skin after washing it thoroughly with distilled rain water. This lotion will finally eradicate those unwelcome and unsightly blemishes known as freckles. The Wrinkle Banisher is prepared as follows:—Strain barley water through a home-made muslin bag, put this water into a new bottle and add a few drops of Belm Gilead, which our druggists will now smilingly tell you is called Tincture of Benzoin. Shake unceasingly until the fluid presents a milky appearance, which will probably require ten or twelve hours. For this reason it should be made only when the bottle can be quickly transferred to the hands of a large family. Before applying this much-praised cosmetic remove all impurities by thoroughly washing the face with newly fallen rain water strained through a piece of cloth of suitable texture.

Women and Fashion.

It is an old saying that "One might as well be out of the world as out of the fashion, but Dame Fashion her self, if she were a person, would smile at the way some people follow her decrees so blindly. When will women learn that they themselves are the important interest and not their clothes? The modern woman should let her clothes express her own individuality. If she copies other people merely she seems but one of the crowd. The best way is to follow the fashion modified to suit one's own particular individuality, one's own purse and station in life. Gracefulness and suitability should never be lost sight of. The fashion of the day is always charming to some particular style of figure, but just because it is the fashion it need not be adopted by all. This is the day for those with ample figures to rejoice. The long lines of the onepiece or princess gown decreases the apparent breadth and increases the effect of height. But the very slender maiden will be wise to avoid it, as it, for the same reason will make her look frail. The skirt and the waist idea with their cross line of belt should suit her and should likewise be avoided by the stout woman. This season the prevailing fashion for the hair is very full and low, with coils or puffs at the back of the head. This is a very pretty style for the tall, slender ones, but those with short necks should wear theirs higher up. Common sense and suitability should govern one's appearance more than fashion.—Aunt Jane.

What a Boy Can Do on a Farm.

When I was four years old my father gave me a ewe lamb to be all my own, writes an Indiana boy in Breeder's Gazette. I was to give him half of her lambs and wool for feeding her and her lambs. I saved the money I got for my share of the stock.

When I was eight years old father gave my sister and me a pig to raise; we fed him well and when we sold him we got $3 each. This much more added to my account it began to get larger each year.

At the age of eleven my mother went to Michigan for her health; she gave me a hen and some thirty chickens, if I would feed her chickens well while she was gone. I did so, and when I sold them I took the money and what I had pefore and bought a sow from my father. I was to give him half the pigs she raised and he would feed the sow and pigs for market. I still saved the money I got for my stock.

At the age of thirteen I purchased a steer from my father, with the agreement that he was to receive half the gain. When I was fourteen I purchased a colt for $47 50 from a neighbor. I am fifteen years old and have the following stock; one colt worth 70; four sheer worth $22; five hogs worth $30; cash on hand $71; total $193.

This shows what a boy can do on the farm if his father will give some stock and share with him in the profits. If more well-to-do farmers would give their sons some stock it would be an encouragement to the boys to feed and care for stock, and there would not be so many boys leaving the farm and going to town to work as hired men

It is claimed that this cheap mixture marvellously improves the complexion, or preserves the bloom of youth and if used but once a day (and what woman cannot apply it to her face while resting)? it smoothes the corrugated brow, causes gradual disappearance of many-toed crows foot and imparts to many neglected skins a surprising, infantile freshness. Either rice-flour or wheat-starch is advised to be used in connection with the foregoing recipes, but a friend who has experimented with toilet preparations assures me that these vegetable powders are very injurious to the complexion. By coming in contact with the general moisture of the skin known as perspiration, they easily sour and ferment, perhaps bleaching the skin for a time, but finally producing an irritation, which, if not arrested in its early stage, will result in eczema or some kindred eruption. Long experience and a chemical analysis of Mennen's Borated Talcum Powder causes this friend to believe it is the most soothing and healthful that can be found. Talcum, being a mineral, undergoes no fermentation and when judiciously incorporated with boracic acid and other healing ingredients, produces what she regards as the only suitable application for the "human face divine"—Epitomist.

A New Candy.

If you have not yet heard of this new and delicious sweetmeat, you may be sure that you will derive much pleasure, not only in making it for your own use, but in introducing it among your friends for while a "new" candy is not so great a novelty in these days, this new "Sea Foam Candy" has won instant popularity. Here is the recipe: To three cupfuls of light brown sugar add one cupful of boiling water, and place over the fire. Stir only until the sugar is dissolved, then cook without stirring until it spins a thread. Take from the fire, and when the mixture stops bubbling add it gradually to the stiffly beaten whites of two eggs. Continue to beat, using a wire egg-beater, until the mass is soft and creamy, and yet is of sufficient consistence to stand alone without spreading. Flavor with vanilla when half beaten, and, when done, add a cupful of English walnuts that have been chopped rather coarsely. Drop in pats on waxed paper.

MISS A. S, Sydney, N. S.

A Way to Alter Skirts.

Endeavoring to find, without ripping, a way to alter skirts that had become too large in the waist (which necessitated their being pinned in many places to prevent their dropping below the belt), I hit upon the following device:

My skirt was twenty-six inches and I wished it twenty-five.

After quartering the band, and marking each quarter with a pin, I took a large needle and some wrapping-string and ran it in the waistband with the short stitch on the right side and a longer stitch, not coming through; at each quarter I drew it up a little, making the first measure six and a quarter inches, the next twelve and a half, etc. The fulness thus equally distributed was not perceptible, and the skirt fitted as well as when first made.

To Get Rid of Ants

When troubled with tiny red ants getting into the cake box and other sweets place the box or dish of sweets in the center of a table or shelf and moisten all around it with essence of pennyroyal. The ants will not cross that strong odor and will gradually disappear.

Mrs. HELEN EICHHORN.

The Ever-Helpful Poultice.

BREAD AND MILK POULTICE.—Put one tablespoonful of stale bread crumbs into a gill of milk and let boil up once. Take from the fire and gradually stir in a little glycerine or sweet oil, so as to render the poultice pliable when applied.

HOP POULTICE.—Boil one handful of dried hops in half a pint of water until the half pint is reduced to a gill, then stir in enough Indian meal to thicken it.

MUSTARD POULTICE.—This may be made of equal parts of ground mustard and flour, made into a paste with warm water and spread between two pieces of muslin cloth or it may be made into a paste by mixing the mustard with lard or butter.

LINSEED POULTICE.—Take four ounces of powdered linseed and gradually sprinkle it into one cupful of hot water.

GINGER POULTICE.—This is made like a mustard, using ground ginger in place of the mustard.

A LETTUCE POULTICE.—Boil a good-sized lettuce in water till soft, then use the water to make a linseed poultice; the juice of the lettuce has a soothing effect.

The Etiquette of Cards.

The full name is used on cards. It is usual for a husband and wife to have separate cards and in the same style of engraving and the same shade of white. These small items are important. Business cards are never used in social matters. If a man needs a card with business address he may have this engraved on lower lefthand corner of his card. It would seem ostentatious to have the names of several banks on his card, but he should ascertain the wishes of his chief in regard to what to put on his business cards. He represents the persons or corporation in whose employ he is and must follow their wishes in the new enterprise in which he is entering.

Benzine Removes Fly Paper.

Any article—children's dresses, hubby's coat or trousers, books, or even the cat—that has had the misfortune to come in contact with a sheet of tanglefoot, can almost instantly be cleaned of the sticky substance if sponged off with benzine.—L. F. S.

Hints from Each Other.

Put a sponge or a moist fruit such as an apple or a cut orange into a cake box when the cake seems dry. The cake will absorb the moisture and some of the fruit flavor if left a day or so.

If you have rust stains on your linens buy five cents worth of salts of lemon, lay the spotted part over an empty bowl, cover with the salts, moisten the finger and rub it in a minute or two. After a short time pour boiling water over it and the spot should disappear immediately.

Another good floor wax is made from dissolving 1-4 pound beeswax in 1-2 pint of turpentine. This must be done very slowly and carefully on the back of the stove as turpentine is easily ignited if too hot. Keep stiring and beating occasionally till all the wax is melted, then beat well and set in pots to cool. Rub on the floor with a soft cloth and polish with a flannel.

Child Affection.

There has been a great deal of talk lately about the bringing up of children, so that the young parents hardly know just what way is best. We all want to bring up our children in the very best way possible, but experience alone can teach us just what suits each individual child in training

Most of us had parents who held to the idea that descipline must be maintained at any cost and the child taught to obey without comment and at once. Many others have maintained that children should develop of themselves happily and without punishments. Observation shows that the extreme of

discipline is stunning to the mind's individual growth, but that too much license with a child is like free growth to a grape vine. Moderation is the safe guard. Care and cultivation in child life is the same as in plant life. One would not think of boxing a grape vine all up tight—yet left without care or pruning the fruit would be small and useless.

The great principle is to teach the child that you love him—teach it again and again—by showing him by your care and thoughtfulness of his welfare, and by telling him so while he's small at least. Then also teach him to love you. He has to learn this as well as other things. So often we expect the little chap to return our love instinctively that we forget that we must show him how to express our feelings. The moral nature is a growth the same as the physical nature, and we must help him to grow happily and easily by showing him how, as well as living ourselves the best we can. The strongest love is that which is firm for what is good and right, but if the child understands we love him and loves us in return, he will yield to our firmness without resentment.

Teaching Children to Lie.

'Children, obey your parents.' 'It is as strange as sad how many children have failed to learn that command,' writes Ernest Gilmore, in 'American Motherhood.'

There is litttle Dan Goodwin, a bright, little fellow, with a sweet nature. He is, however, a regular interrogation point. I will give you a picture of him and his mother.

'Dannie!' she calls.

He is at play and does not reply.

'Dannie, come here,' raising her voice.

He continues to play, ignoring his mother's command.

'Dannie, do you hear me?' her voice still louder. 'Are you coming to me?'

He deigns to speak at last, but does not make the least move in her direction.

'What do you want me for?' is his query.

'I want to change your waist.'

'What for?' he demands.

'Are you coming to me, Dannie, or do you want me to whip you?'

'What do you want to change my waist for?'

At this state of affairs the mother comes after Dannie, and giving him a little shake, leads him toward a secluded back room, scolding and threatening all the way.

'You're a naughty boy,' she says, 'and I shall give you a good whipping for not minding me.'

He whimpers and then cries. He can talk now.

'I don't want you to whip me,' he says, 'I don't want you to whip me.'

Does she whip him as she has promised to do? Oh, no! She says presently. 'The next time you don't come to me the first time I call you I'll whip you.'

The next moment she is kissing him repeatedly as if he was the most obedient boy in the world.

Poor mother! Poor Dannie!

A second picture. Johnnie Brown is two years older than Dannie Goodwin, but his extra years have not brought him obedience. Johnnie is not more mischievous than the average boy of his age, but he has not been taught to mind. It is a May morning when we introduc Johnnie and his mother to you. The dew lies heavy on the grass, and Johnnie's shoes have thin soles, and he has on short socks, exposing his bare legs to the knees. He is in the centre of the wet lawn (which has not seen the lawn-mower) before his mother sees him. He has been forbidden to go on the lawn so early in the morning, but that bears no weight with Johnnie. As soon as Mrs. Brown discovers him, she calls irritably:—

'Come off that grass this minute.'

'What for?' is his response.

'The grass is wet.'

'What makes it wet.'

'The dew.'

'What's the dew?'

'I'll show you what the dew is,' angrily, if you don't come off the grass this minute.'

'Then show me now,' he bawled.

She seemed to realize her inability to get Johnnie unless she went for him, so she started on a run over the wet grass. Seeing her coming, Johnnie ran in an opposite direction. He had nearly reached a hedge, when she called:

'Look out, Johnnie, there's a big, black snake in that hedge; it'll bite you.'

There had never been a snake in that hedge, or in that vicinity in Mrs. Brown's remembrance, but the lie conquered Johnnie. It brought his little wayward feet to his mother. His face was white, his form trembling. Mrs. Brown had no trouble for the next two or three mornings in keeping Johnnie off the dewy grass, for he was very much afraid of black snakes. But there came a morning when he was on it again brancing about in wild glee. His mother was annoyed.

'Have you forgotten the black snake, Johnnie?' she called, but he only laughed.

'I'm not afraid of black snakes,' he said, 'besides therearen't any here nor never were. Billy Smith said so.'

Billy Smith against mother!

Alas, poor Mrs. Brown!

Oh, poor little Johnnie!

Just one more picture, although I could give you dozens, to say the least.

It would be impossible to find a brighter or more beautiful child than little Tom Hunter. He is only four years old, but has more knowledge than many boys twice his age. If little Tom had been taught to mind, he would be wonderfully promising. Young as he is, he seems to have settled the question, 'Shall I obey or not ?' in the negative. Tell him to 'come' and he 'goes,' to 'go' and he 'comes.' Tell him to 'close' the door and he 'opens' it, to 'open' it and he 'shuts' it. If he is knocking on the window and he is requested to stop, he knocks harder. He tries his mother to the verge of distraction, but (I say it regretfully) it is her fault. She has never taught him to mind. Probably she thinks she has done her duty, but threatening is not teaching—never was and never will be. This is a fair picture of little Tom and his mother one cold winter morning. The boy, as usual, has been disobedient. Scolding and threatening have had no effect, Mrs. Hunter has suddenly resolved to try a new medicine for refractory Tom (that is, new for her, although it is quite popular). The little fellow is still in the basement in open rebellion when his mother ascends the stairs to the first floor. He hears her open the front door, wondering what for, as no one has rung the bell. The snow lies thick on the ground.

'Helloa, old black man,' says Mrs. Hunter. 'Do you want a little boy, who doesn't mind his mother? You do, do you ? Well, you can have him; wait and I'll get him for you,' and she closes the door. Tom has heard her, and feels deeply wounded. He ascends the stairs as speedily as his short legs will allow, his anger increasing at every step. When he stands in the presence of his mother, the storm breaks. He stamps his feet and cries out :—

'Nasty ole black man ! He shan't have me, I won't go with him. I hate him; I'll kill him,' and he races to the door and tugs until it opens. The piazza has not been swept. The snow lies over it in an unbroken surface. He does not see any 'ole black man' or any trace of footsteps, and for one moment he looks dumbfounded. Then he cries out to his mother :—

'Tisn't so, there isn't no black man after me, an' there wasn't or there'd be tracks in the snow. It's a nasty old lie.'

It was not respectful of Tom to talk like that, was it ? But you will all admit that he told the truth.

Poor Mrs. Hunter ! She does not realize the kind of seed she is sowing.

Amatite ROOFING

Will End Your Roofing Troubles

IF you will write to-day for a free sample of "Amatite" the end of your roofing troubles is in sight. After you have submitted it to every test that you can think of, you will be prepared to order it not only for your *new* buildings, but for your *old* roofs as well. You will find that it is cheaper to cover them with Amatite than to continue painting and and repairing them.

We make a strong point of our "Free Sample" offer because the smallest sample of Amatite speaks for itself. It is more convincing than yards of talk.

There are all kinds of ready roofings on the market—so-called "rubber roofings," so-called "guarantee roofings," so-called "sand surface roofings."

The "rubber" roofings are no more made of rubber than a cow is made of saw-dust. The "guarantees" that are promiscuously handed out with many brands are hedged around with so many provisos that it will take three lawyers to dissect them and find out what they are all about. The "sand surface" has little or no protective value.

The point to remember is that all of these roofings have to be *painted* every year or two to keep them tight. In other words, it is the *paint* that protects, and not the roofing. If a man will sit down and figure out exactly what this paint costs, he will find that it is more than the roofing itself. Amatite, on the other hand, has a surface of *real mineral matter* and we sell the goods on the broad statement that you need never coat or paint this roofing.

You can lay Amatite on a roof and then forget all about your roofing troubles. *No painting, no coating, no worry.* The man who puts Amatite on his buildings is insured against leaks and trouble for many years.

Free Sample

If you have any doubts about the matter and want to investigate our claims, send for sample and booklet to-day. The sample tells its own story; the booklet is written for practical men. It hits straight from the shoulder.

Honey.

ONE OF NATURE'S BEST FOODS. It is only within the last few centuries that sugar has become known, and only within the last generation that refined sugars have become so low in price that they may be commonly used in the poorest families. Formerly honey was the principal sweet, and it was highly valued three thousand years before the first sugar-refinery was built.

It would add greatly to the health of the present generation if honey could be at least partially restored to its former place as a common article of diet. The almost universal craving for sweets of some kind shows a real need of the system in that direction; but the excessive use of sugar brings in its train a long list of ills. When cane sugar is taken into the stomach, it can not be assimilated until first changed by digestion into grape sugar. Only too often the overtaxed stomach fails to properly perform this digestion, then comes sour stomach and various dyspeptic phases.

Now, in the wonderful laboratory of the hive there is found a sweet that needs no further digestion having been prepared fully by those wonderful chemists, the bees, for prompt assimilation without taxing stomach or kidneys. As Prof. Cook says: "There can be no doubt but that in eating honey our digestive machinery is saved work that it would have to perform if we ate cane sugar; and in case it is overworked and feeble, this may be just the respite that will save from breakdown." A. I. Root says: "Many people who can not eat sugar without having unpleasant symptons follow will find by careful test that they can eat good well-rippened honey without any difficulty at all.

Not only is honey the most wholesome of all sweets, but it is the most delicious, and its cost so moderate that it may well find a place on the tables of the common people evey day in the week.

Indeed, in many cases it may be a matter of real economy to lessen the butter bill by letting honey in part take its place. One pound of honey will go as far as a pound of butter; and if both articles be of the best quality the honey will cost the less of the two.

GIVE CHILDREN HONEY. When children are allowed a liberal supply of honey it will largely do away with the inordinate longing for candy and other sweets.

Ask the average child whether he will have honey alone on his bread, or butter alone, and almost invariably he will answer, "Honey." Yet seldom are the needs or the taste of the child properly consulted. The old man craves fat meat; the child loathes it. He wants sweet, not fat. He delights to eat honey; it is a wholesome food for him, and is not expensive. Why should he not have it?

Honey may be used to sweeten hot drinks, as coffee and tea. German honey-tea—A cup of hot water with one or two tablespoonfuls of extracted honey—is a pleasing and wholesome drink.

Various Uses for Salt.

Of all the condiments known to modern cookery, salt is the most necessary and universally used. But indispensible as salt is in the kitchen, it is equally useful in the sick-room, laundry and for general household purposes; in fact, from garret to cellar, so to speak, salt it an ever-ready and resourceful adjunct to good housekeeping.

A weak solution of salt and warm water is a good remedy for colds in the head, sore throat or tender gums, used either as a spray, gargle or mouth wash; it is also a good and cheap dentifrice.

For bleeding of the lungs it is very efficacious, a large tablespoonful in a glass of cold water "to be taken freely."

For intestinal disturbances salt is an excellent addition to the enema as it both cleanses and acts as a tonic.

A tablespoonful in a glass of hot water sipped on an empty stomach is a cure for constipation.

To break the acidity in cranberries add a little salt.

Some claim that a pinch of salt added to boiled coffee improves its aroma.

Hot salt-bags relieve neuralgia, earache and tooth ache, and cloths wrung out of hot salt-water should be applied to all sprains and strained muscles. Salt-water foot-baths, hot or cold, are helpful for swollen or tired feet and children with weak backs and ankles should have a gentle salt-water rub once a day.

Every well equipped laundry should have a jar of salt among its assets. Immerse all handkerchiefs and bloody cloths in cold salt-water before washing; it eliminates all unpleasant features and stains. Put a little starch to give it gloss. Salt added to the water in which colored clothes are washed holds the color. If salt is put in the rinsing water, clothes do not freeze so readily when hung out in winter.

Salt on a piece of paper makes a good polish for flat-irons.

To remove rust spots wet with vinegar, cover with salt and expose to the sun; repeat until the stains are drawn out. Salt with vinegar is good to clean brass, bottles and stained cruets. Always add salt to the water kept in cuspidors.

Coarse salt moistened with amonia if spread on the carpet before sweeping will both clean it and restore its color.

Use salt-water to wash matting, and put salt in water to wash windows in winter to prevent then from becoming frosty.

If food has been spilled in the oven, cover with salt at once to prevent unpleasant odor. When the fire is low a little salt strewn over embers often revives it. Salt is used to thaw frozen water pipes, and if sprinkled on the door steps and outer stairs when covered with ice they are easily kept clean. In the fall strew salt on the flower beds after the buds and flowers are taken up, this destroys the seed and roots of the crop of weeds, during the winter salt disintegrates and when the beds are dug up it has some value as a fertilizer.

By this list you will see the importence of this simple mineral and the necessity of always keeping the salt cellar well filled.

Modern Motherhood.

After babyhood—oh so closely—comes the problem of education. The race has evolved to a plane, where it no longer is content with merely physical living, but demands that the brain be strengthened and exercised to its fullest capacity.

A child's mind is like the wax disk of a phonograph, fresh to receive impressions. There is no reason why it should merely catch the odds and ends, foolish nursery jingles, more or less heterogeneous adult conversation.

The kindergarten, the school, furnish careful training, combined with pleasure, and no child of six, unless seriously ailing, will be harmed by the regular, simple and methodical lessons.

In vain does the mother try to persuade herself that it will be better for the little one's mind to lie fallow a few years more. There is no reason for any human brain, however young, to remain inactive and vapid; and educationalists, for centuries, have been studying just the proportion of work and play best for a symmetrical development.

Then, too, if the child be an only one, as is so often the case nowadays—it is an injustice to it, to keep it from its kind, when its little soul yearns for its natural mates.

Who of us but can recall that wonderful first day at school! The pride, the wonder; the dozens of other little egos like ourselves; the owning of a slate! We did not express it then—we merely felt, but now we would say that there is no greater joy on earth than the conscious unfolding of the human mind. If school-days come that are burdensome, it is the teacher's fault, for study should be made fascinating—is it not the path to knowledge?

How can a mother be satisfied in giving her child anything but the best,—the best father, the best health, the best education?

We love our little ones, yes. Perhaps we love them too much. Our fierce mother-passion binds us sometimes to justice and right. Our children have a small quarrel with those next door. We rush into the fray like tigresses, protecting our own, assuming them to be right, without the slightest inquiry as to the facts in the case. What an opportunity was lost to teach them justice and control.

Again, to obtain peace, we cater to their worst sides. I once called on a woman, whose pretty little girl opened the door a crack and peeped in. "Go out this instant; don't come in here!" commanded the mother. I was disappointed, for I wanted to see the child. She promptly walked in, however, and was very much in evidence. When I asked about this, the mother cooly told me that Rosie was so stubborn that she always told her to do the exact opposite of what she really wanted, in order to insure desired results.

Gradually, however, the race is improving, and universal motherhood is becoming more intelligent.

Some Ideas on Resting.

I think I owe my good health and sound nerves very largely to the fact that I have never in my life as teacher or as housekeeper stood when I could possibly sit. Standing while about one's housework is often necessary, but it very often is not necessary. The little unnoticed strains are a greater wear and tear on one's vitality than are the big ones. Every kitchen should contain a small armless rocker and a stool, the latter high enough to sit on and reach the ironing-board easily, low enough to be pushed under the table out of the way when not in use.

Paring apples or potatoes and picking over fruit should be done while sitting in the rocker, as should the bit of sewing or the reading of a book taken up while superintending something cooking on the stove which must be waited for.

Another thing which has been of great value in preserving my strength has been an after-breakfast rest. Breakfast over, eveybody started off to school or business, I sit down or lie down on the convenient sofa with the morning paper for ten or fifteen miuutes. Then I get up and attack the army of the day's duties, beginning, of course, with the advance guard of the breakfast dishes. In those few minutes I have gained needed rest and from the paper something to think about while at my work.—M. D. V.

Saving and Spending.

The American woman is pre-eminent in many things. But her best friends can hardly claim for her that she is a careful saver or a wise spender. The most intelligent woman in the world, in many respects, she is not always intelligent on these two important points. She can earn money—no doubt of that. But economy is to her the dismal science, and investment a matter of

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's

Caustic Balsam

IT HAS NO EQUAL

For the Human Body — It is penetrating, healing and for all Outward Pains, Bruises or Wounds, Pains in the Chest, Colds and Rheumatism. CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

Cause Of Eczema Explained

Germs Fester in the Skin and Blood Cures are Impossible.

After years of debate medical authorities are now agreed that Eczema and other skin diseases are not seated in the blood, but are caused by germs in the skin. Myriads of microscopic animals gnaw the flesh just below the epidermis. The patient is perfectly healthy, it is only the skin that is diseased. Hence, scientists are agreed that you must cure the skin through the skin.

The medicine must be in a liquid form in order to penetrate properly, as salves and ointments clog the pores without reaching the inner skin.

The remedy that will search out and destroy the disease germs, stop the itch and sooth the healthy tissue is that mild, clean compound of oil of wintergreen, thymol, glycerine, etc., known as D. D. D. Prescription.

The instant you wash with this soothing liquid you will find the itch relieved. We positively assure you of this.

Write the D. D. D. Laboratories, Dept F. M., 23 Jordan St., Toronto, for a free trial bottle, and prove it yourself.

For sale by all druggists.

speculation, literally. Only in New England has economy become a part of character, as it ought to be. For money, in any quantity, is power, and power is responsibility.

The girl, who spends her allowance in candy and matinee tickets, is relaxing the moral fibre of her own character. She graduates into the woman, who buys a spangled lace robe, which she really could do without, because it is cheap or because she has a little extra money on hand. "The true view of economic life," insists an authority on financial questions, "requires that every expenditure be regarded as an act that involves a moral question, as indeed it does. It is a moral act if it be necessary and wise. If it be unnecessary and unwise, it is immoral, for it is the misuse of so much power as the money stands for." Perhaps this may be called a counsel of perfection. But it would bring, if followed, peace and prosperity into many a household where debt and financial chaos now reign. "Why can't we have bills? Then we could put all the people off," argued a bride of a few months with her young husband a professional man, striving to make his way on an income of fifteen hundred dollars. She was the product of a first-rate boarding, and the child of a family high in social position. But she was utterly uneducated in the morals of handling money.

Financial independence, for most families, can only be secured by careful, steady saving and equally careful spending. Such saving and spending mean self-control—the very root of all high character. The grocer's bill, the bargain counter, are moral tests. There is a great deal said and written nowadays about the "business woman," using the phrase to describe the woman who earns money. But all woman, in their relation to money, are business women. The earning of money is one branch of business; the distribution of money is another quite as important one. Both require integrity, self-control, and determination to do one's best, if the business woman is to succeed. The wife, who has the spending of her husband's income, can double its purchasing value if she has made a study of the art. Tried by this standard, it is hardly a credit to the American woman's intelligence to count up the households where no money is saved, where small debts accumulate, and where shopping is one of the amusements of life.

A Group of Ginger Cookies.

For years I sought in vain to find a satisfactory recipe for soft, thick ginger cookies, and at last I resolved to originate one.

Take one and one-half cupful of best Porto Rico molasses, half a cupful of sugar, a scant cupful of melted shortening (butter, lard, drippings or a mixture), one good teaspoonful of salt, one heaping dessertspoonfuls of ginger half a dessertspoonful of cassia, two dessertspoonfuls of soda, to dessertspoonfuls of strong cider vinegar, one well-beaten egg. Stir well together and add one scant cupful of buttermilk. If the buttermilk is not obtainable, hot water will answer the purpose very well. Then stir in lightly sufficient flour to roll soft, but do not mix the dough stiff, or the cookies will be hard. Roll thick, and sprinkle a little sugar over the top. Bake in a quick oven.

Many people dislike to let their children eat cookies in which there is much shortening. To meet such emergencies, here is a recipe that does not call for any: Mix well together half a cupful of sugar, a scant teaspoonful of salt, a teaspoonful of ginger, a teaspoonful of vanilla and one well-beaten egg. Bring one cupful of molasses to a scald, but do not let it boil; when hot, stir in an even dessertspoonful of soda, and, while foaming, add a dessertspoonful of strong vinegar. Pour this over the sugar and egg mixture, beating them well together; then stir in lightly sufficient flour to roll, and bake in a quick oven.

For thin crisp ginger wafers, take one cupful of molasses, half a cupful of butter or butter and lard mixed, one teaspoonful of soda, one teaspoonful of ginger, salt to taste and flour to form a stiff dough. Roll thin and bake till nicely browned in a quick oven.

Taking Care of House Plants in Winter.

Nearly everyone has some kind of fern or palm to give the house a bit of greenery, but a good many people find it very hard to keep these plants in good condition. Now the ordinary manner of watering palms and ferns is one of the surest ways of injuring them. Don't water these plants every day by pouring water in the top of the pot. This is all wrong. The proper method is to submerge the pot in a pail of water, and, after leaving it there for a few minutes, take it out and allow it to drain thoroughly. If watered in this way plants will remain moist, and the operation need not be repeated more than once in three or four days. It also prevents that decaying at the base of the stalk that arises from the water settling there when it has been poured into the top of the pot. Another thing that is very injurious to palms is the practice of setting a basin or saucer of water under them. In this way water is constantly absorbed and the lower roots become so saturated that they will in time decay.

It is often very difficult to prevent the foliage of these plants from turning brown. This is due to the dryness of the atmosphere of the house, and the only way to avoid it is to sponge the leaves with warm water every day, if the palm is large; or, if it is a fern or a palm with feathery foliage, it can be sprinkled. Ferns require less light than enters an ordinary house in winter will do no harm to either. The best manner of destroying insects on palms is a daily wash of warm water and wail-oil soap.—McCall's Magazine, Mrs. F. C. B.

The Mark of Age in Women.

"I mean to keep young with my children," said a clever woman the other day. "And the first wrinkle that would come on my mind, if I let it, would be fear and dislike of conditions as they are. I can't keep my children in the atmosphere of twenty years ago; it isn't there—it doesn't exist. I can't stay in it myself if I want to understand them and help them. When today ceases to be as good, as full of opportunity, as yesterday to me, then I will be old—and I don't propose to be old, if I can help it, till the last possible minute of my life. Besides, as long as I keep up with my girls, they find sense in what I say. They talk to me of their perplexities; they say, 'Oh, mother you always understand!' I had a mother who kept young with me, and I mean to follow her example."

It was a wise resolve. The line of age is crossed, truly, when we separate ourselves from the present—when we insist that "the former days were better than these." We cut ourselves off thus, inexorably, from the young, hopeful, marching hosts to whom the present is what twenty years ago was to us. And as Time cannot turn backward, we are left at the rear, to criticise and—yes—grumble. How much better the spirit of the young woman—eighty-five years young—who said, laughingly, on her last birthday, "No, things aren't where they used to be fifty years ago, I admit, and neither am what I was, and I'm glad of it?"

Burning String in the Sick-Room.

Months spent in the sick-room have taught me many things for the comfort of an invalid, one of the simplest and most effective of which is burning a string to purify the atmosphere.

Take a soft string and stick it with a pin to the back of a chair; after lighting, blow it out gently, leaving the tiny spark, which will create smoke enough to make a decided difference in the atmosphere. S. M. K.

GOOD REPORTS

Home Mixed Stock Food a Success

A short time ago we published in this column a formula for preparing Stock Food at home from Barnes English Compound and fresh nutritious grains.

We have received so many words of praise for this formula that we are reprinting it for the benefit of those who may have chanced to miss it.

The advantage of making your stock food at home, using only the pure medicines and fresh grains, and avoiding harmful drugs and worthless fillers, is certainly of great importance to every farmer and stockman.

The formula is as follows: Mix three pounds of Linseed Meal and six pounds Cornmeal with one pound Barnes English Compound, it will make ten pounds purest and strongest stock food that can be made. S. G. Amsden, Windsor, Ont., will send one pound package postpaid on receipt of 50 cents, money order or stamps.

Bedtime Lunches.

Physicians advise a bedtime lunch for nervous and emaciated people. The long hours of sleep consume about one-third of our existence. Although the demand made upon the system is naturally much less than during the waking hours, there is a wasting away of tissues consequent upon the suspension of nutriment for many hours. The body feeds upon itself, for food taken at dinner is digested at bedtime. Often one is restless and wakeful at night, the stomach is empty.

Onions are an excellent and harmless soporific. Eaten raw at bedtime, sliced thin and spread upon bread and butter, with a pinch of salt added to make them more palatable, they have cured insomnia where many high-sounding and possible harmful remedies have failed.

Keeping Dinner Warm.

Not long ago I saw a mother take off enough dinner for another member of the family who had been detained. With another plate to cover it, it was put in the oven to "keep warm," but in reality to dry up. I mentioned to her my way of keeping dinner for the late-comer, and she was so grateful for the suggestion that I thought some of the readers of MARITIME FARMER would like to know also. I have found "The Home Pages" of great benefit to me, and wish to lend a hand.

A saucepan filled nearly full of boiling water is put on the stove, and a dinner-plate containing the vegetables is placed over it; a pan covered over the plate will keep in the steam. For hours the dinner may be kept steaming hot and palatable.—E. L. M. A. St. John, New Brunswick.

The family that eats plenty of

Quaker Oats

is a healthy, rugged family.

The most popular food in the world because it does most and costs least.

54

"Bronchitis."

THE SYMPTOMS ARE

Tightness across the Chest, Sharp Pains and a Difficulty in Breathing, a Secretion of Thick Phlegm, at first white, but later of a greenish or yellowish color coming from the bronchial tubes when coughing, especially the first thing in the morning.

Bronchitis is generally the result of a cold caused by exposure to wet and inclement weather and when neglected will become chronic.

Chronic Bronchitis is one of the most general causes of Consumption. Cure the first symptoms of Bronchitis by the use of Dr. Wood's Norway Pine Syrup

Bronchitis Cured.

Miss Martha Bourget, Little Pabos, Que., writes: "Last spring I was very poorly, had a bad cough, sick headache, could not sleep, and was tired all the time. I consulted two doctors, and both told me I had bronchitis, and advised me to give up teaching. I tried almost everything but none of the medicines gave me any relief. One of my friends advised me to try Dr. Wood's Norway Pine Syrup. I had scarcely taken the first bottle when I began to get better and when I had taken the fourth bottle I felt as well as ever, my cough had left me and I could sleep well."

Dr. Wood's is the original Pine Syrup. It is put up in a yellow wrapper, three pine trees the trade mark, and the price 25 cents. There are many imitations of "Dr. Wood's" so be sure you receive the genuine when you ask for it.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Make Farm Homes Attractive.

There is no place so susceptible of improvement as the average farm home. There is perhaps no place where so little is done to improve the beauty of the surroundings as one finds in the farm home. Usually there is an abundance and a variety in the topography of the land in trees, shrubs and plants of all descriptions, all of which may be used to advantage in making the home attractive. Tools and teams can also be had on the farms. It is only for the want of labor, a fixed time to do the work and a definite plan in mind as to how to go at it.

The trouble with many good farmers seems to be that they find little time to do anything else than attending to the most important work on the farm during the year. They attempt to cultivate too much land with the least possible help. Many farmers would in many cases grow rich faster if they cultivated less land, and cultivated it more thoroughly. Farmers with smaller farms could then plant the less productive places, the rough stony fields and abrupt slopes, the lowlands and sloughs, the odd bits, the irregular places in the angles framed by roads or fence lines, with trees such as would be objects of beauty and in course of time add value to the property.

Making our homes and surroundings attractive in this fashion would be a source of pleasure to those doing the work and all the occupants of the home The pleasant associations and memories of farm homes, where beauty and utility can be brought about to operate harmoniously, will make the home the dearest place to the boys and girls. Beautiful and agreeable surroundings about our country homes will keep our boys and girls at home and it will attract city sons and daughters countryward.

It is frequently intimated that farm boys and farm girls must work too hard and that there working days are too long; that little or no opportunity is given them for amusement and recreation in the country. While this is often true there is no reason why the country should not have all the advantages of a city. With the practice of making all things pleasing to the eye about our homes coupled with the use of rural telephones and rural free mail delivery, free traveling libraries, better roads and intelligent practices, farming will then no longer be considered as an isolated life, but rather one of culture and refinement.

The fact that so many country people have been and are moving cityward, will soon be obviated when it is known that statistics show that in 1800 nearly 95 per cent. of the entire population of the United States was rural. At present it reaches about 36 per cent. However, the decrease from 1890 to 1900 was only about 2 per cent. and we hope to see an increase of population farmward by the census of 1910, with the present rapid removal of causes that tend to isolate life on the farm.

Perhaps among the most effective attractions that may be made about our homes, is the setting out of groves of trees. Such groves serve as windbreaks; they furnish shade and in pasture will shelter stock from hot sun in the summer and fierce storms in autumn and spring. Every effort possible should be made to encourage the growth of such trees as the elm, the maple, the basswood, the ash or any other spreading trees, in the pasture, near the road and around the farm buildings. Shrubs and flowers, too, should be planted where they will produce the best effect.

The benefit that comes from the taste and skill acquired in the work, will enable one to become more skilful, not only in beautifying the home and making it more attractive, but in making one more skilful in the raising of crops and animals on the farm. It will give one a better point of view of farming It is conceded that the most thrifty and successful farmers are those who have a love for the beautiful and who keep their lawns and shrubbery well trimmed; the fences in good repair, the tools and machinery in sheds, when not in use; farmers who do not allow weeds to grow on their farms and who remove from sight all rubbish and unsightly things about the premises. It is virtually with this class of farmers that love of order prevails everywhere. Thrift and beauty, self-reliance and patience about the farm home should go hand in hand.—J. F. WOJAT, in Breeders' Gazette.

Vegetables.

Green vegetables are less nutritious than roots, and are valued chiefly for their dietetic value and for their flavor. They are largely composed of water and cellulose, which makes them useful as laxatives. They contain, as a rule, about 90 per cent. of water, and only 1 1-2 to 3 per cent. of muscle-building materials. But their value in the diet cannot be over estimated. Taken individually, we find that most of them have a medicinal value, which, if fully appreciated by the public, would do much to decrease the alarming consumption of patent medicines, which at present prevails amongst our people.

ASPARAGUS is not a delicacy of recent date, but was highly valued by the Romans as long ago as 425 B. C. The green asparagus is considered the best variety, and may be grown to perfection among the vines in our maritime counties. It is only slightly nutritive, but contains a crystaline nitrogenous substance called asparagin, which produces marked physiological effects.

CABBAGE contains sulphur, and is, therefore, flatulent in effect. Boiling dissipates a good deal of the sulphur compounds and softens the cellulose, but cabbage is never so digestible as when young, and eaten raw, with vinegar, as with salads.

CAULIFLOWER is an inflorescence of a species of cabbage. It is the most delicate and digestible of all the cabbage products.

KALE, another cabbage plant, has rather an acrid flavor, but is delicate and easily digested.

BRUSSELS SPROUTS are little clusters of leaves, resembling cabbages formed in the axils of the main leaves, and are very good, being delicate in flavor and easily digested.

CELERY, either roots or blanched stems, are eaten raw, alone or in salad, or used to flavor soups, or boiled with cream sauce. The blanched stocks contain an aromatic oil, sugar, mucilage, starch, and also manose sugar, which is also found in honey, and is strong stimulants to the execretory organs. The daily use of celery as a salad is said to remove nervousness and palpatation of the heart. Onions have also the same effect and may be used when celery is out of season It is also used in rheumatism cases. This painful ailment will yield to the continual use of celery, prepared in the following manner.

Cut the celery into pieces and boil in water until soft. This "stock" of water should be drank by the patient. Put whole milk and a little flour and a grating of nutmeg into a sauce pan with the boiled celery; bring to the boil, and serve hot with pieces of toast.

LETTUCE is cooling and easile degested. It is a blood purifier and gently laxative in its action. The milky juice is somewhat narcotic and is sometimes used as a laxative.

ONIONS. All varieties are nutritious, and valuable as blood purifiers; also stimulate digestion, and, like celery, are useful for nervousness. "Personal equation" figures largely in the use of onions, as some persons cannot tolerate them at all, while others eat them with apparent relish.

GOURDS. In this group of vegetables we have pumpkins, vegetable marrow, squash and egg plant,—all of them being easily digested, but of low nutrient value. They have a good dietetic value, as the quantity of water they contain is so large.

CUCUMBERS.—Are chiefly of value for the water they contain.

MELONS are also valuable for the amount of water they contain, being more of a drink than a food.

TOMATO, itself the "prince of salads," is never better than when eaten fresh and raw. We have no other vegetable that is capable of being cooked and served in so many ways. The tomato owes its pleasant sour taste to oxalic acid, and on that account, like rhubard, is generally forbidden to those with gouty tendencies. Since oxalic acid forms insoluble salts with lime and magnesia, excessive use of rhubarb or tomatoes tends to thin the blood, and produce outbreaks on the skin.

JERUSALEM ARTICHOKES The tuber of a species of sun-flower, This is nutritious, easily digested; makes good soup. Should be stored in boxes of sand as it dries out quickly.

CARROTS are useful as blood purifiers; wholesome, but not very easily digested.

PARSNIPS are more nutritious than carrots and are best after a touch of frost.

TURNIPS are inferior in nutitrive properties.

RADISAES have a stimulating effect upon the excretory organs and act as demulcent; are often given to remove excess of mucus from stomach and bladder.

ASPARAGUS BOILED. 1 large asparagus. Immerse in boiling salted water and cook slowly for about twenty minutes,— drain and serve with the following sauce.

Cook together two tablespoonfuls of butter and the same quantity of flour without browning, add slowly stirring constantly, 1-2 cup of stock or water in which the asparagus was boiled and 1-2 cup of milk. Season to taste and pour over asparagus.

BEETS WITH THE SAME SAUCE. Boil till tender six small beets, drain and cover with cold water. Mix a cup of sugar, 4 tablespoons corn starch, 1-2 cup vinegar, 1-2 cup boiling water. Bring all to the boil and pour over beets. server either hot or cold.

CARROTS.—Boil twelve small carrots, drain and cut in slices, heat gently in melted butter, mix together 1 cup of white sauce and one cup of green peas and pour over the carrots, serve very hot.

HORSERADISH SAUCE. 3 tablespoons grated horseradish, 1 tablespoon vinegar, 1-4 tablespoon salt, dust of cayenne pepper, mix thoroughly and when ready to serve add 1-2 cup cream, whipped very stiff. To be served with roast beef.

BEAN SALAD. 2 cups cold beans mixed with two tablespoons tomato catsup and covered with 1 tablespoon capers, surrounded by one cup celery cut in nice pieces. Serve with cettie dressing.

CABBAGE SALAD. 2 cups of cabbage chopped, 1 cup celery, 1 teaspoon cloves or onions grated, 2 drops tobasco sauce of 1 tablespoon tomato catsup. Mayonnaise dressing.

SALAD DRESSING. 2 tablespoons butter creamed. Add one teaspoonful each of salt and sugar, 1-2 teaspoonful each of mustard and salt. Put into a double boiler. 2 yolks beaten slightly, add 4 tablespoons vinegar and butter mixture—cook till it thickens—and when cold add 3-4 cup whipped cream.

MAYONNAISE DRESSING. Put the yolk of one egg into a very cold basin, and 1-2 teaspoon salt and the same quantity of mustard, stir with a silver spoon till the consistency of soft butter, then add drop by drop 1 cup cold olive oil—stirring constantly—when this thickens add 2 tablespoons vinegar, and 1 tablespoon lemon juice, a few drops at a time.

PICKLES.

CHILI SAUCE.—18 large, ripe tomatoes, 6 onions, 6 small red peppers, 3-4 cup sugar, 2 cups vinegar, salt to taste. Peel the onions and tomatoes, remove the seeds and core from the peppers. Chop all very fine, add the sugar and salt, boil slowly until the sauce becomes quite thick; then put away in well sterilized bottles.

SPICED TOMATOES (Suitable for Game.)

Peel and slice the tomatoes and put them in the preserving kettle with sugar (half as much sugar as fruit, by weight.) A quart of vinegar and one ounce each of ground mace, clover and cinnamon. Mix and cook slowly for three hours. Put in glass jars and seal.

ROOTS AND TUBERS.

POTATOES. The value of the potato as food lies in its starch. It is very poor in nitrogenous material, and cannot be used alone to support life. Its deficiencies material, and cannot be used alone to support life. Its deficiencies in this respect are supplied by the more concentrated foods, rich in proteids and fats, with which it is usually served. Potato juice is acid containing many substances that tend to purify the blood, but the water in which potatoes have been boiled is not wholesome. That in which new potatoes have been boiled is especially so. Severe diarrhoea has been caused by the indiscriminate use of potatoes containing unformed starch and immature cellulose. Potatoes may be stored in pits, or in a cool, dark, well-ventilated cellar; light and frost both being injurious to potatoes, The addition of a pound of lime to each barrel of potatoes absorbs any unpleasant earthy odor. Exposure to light makes potatoes green, bitter and unwholesome. Potatoes taken too early from the ground are apt to heat and sprout when stored.

Absorb Onion Fumes

To prevent the discomfort from peeling onions, the following remedy I have found to be good. Cut off a square inch or so of new potato and stick it on the tip end of a knife you are to use to peel with. The potato absorbs the onion fumes and your eyes are safe.

M. V. K.

To whiten the hands and wrists, make a paste of pounded alum white of an egg, and a few drops of fresh lemon juice. Brush over the skin and when dry wear loose gloves for a time.

The Unity of the Home.

How I wish that it were written over the entrance of every home: "A House Divided Against Itself Can Not Stand." If a home is to be durable and prosperous, there must be unity between husband and wife.

What is more attractive than to see a husband and wife, always agreed, true companions—sharing each others joys, bearing each other's cares, letting every thought be common property?

What is more disgusting than where it is assumed by the husband that his business is entirely his own—that his wife is entitled to know nothing about it? Such a household is a rope of sand, the least touch of disaster breaks it asunder. Here has seemingly been a home, but only the false shadow of a real home.

When by two young people a household is established, it should be clearly understood from the beginning that there is a community of interest, that what concerns one concerns both, that secrecies are disastrous. The world is full of this dangerous division of interest in the family.

God in the beginning, proposed as it was not meet for men to be alone, to make a helpmeet for him. If men would only be ready to make their wives helpmeets by confiding to them their business and consulting them, expecting to work together, for private and public interest; then not only would fast living be far less common, but the lives of women would be less frivolous, less anxious and more useful.

Two are better than one, says the Scriptures, but how can two walk together unless they be agreed? My opinion is, that the most prosperous people in the land are those where unity dwells in the home, and where the husband and wife are fully agreed in every undertaking, from training the smallest child, to loving each one's mother.

Now, loving each other's mother may not seem an undertaking, but from observations, it seems to be a difficult something. I see a very few people who are really devoted to their mother-in-law. I think there is less common sense shown about relatives by marriage than about any other subject. Why must a young man be prejudiced against his mother-in-law as his natural enemy? If she loves his wife and is solicitous for his welfare, she loves and guards what is his dearest treasure, and thus has a claim to his gratitude and in that wife's well-being is freighted the happiness of his home. If there are some of her ways that are not pleasing to him, very likely that account is squared without any effort of his ways being unpleasant to her. Has she not loved and nourished the being dearest to him? If the daughter is charming, does she not probably owe it to her mother? Must not that be a praiseworthy woman who has so carefully reared you a good and noble wife? And if your wife is good and sacrifices lots of things for your pleasure, why cannot the husband make one sacrifice and be as kind and pleasant when his mother-in-law is present, as he can in the presence of other ladies?

I have seen men who could be polite to other women, but when the wife's mother came in they appeared to act as disrespectfully as they possibly could to womankind. Now, don't you know, they were piercing a wound in the bosoms of their sweet wives?

Northumberland Co., N. B.

That Boy of Ours.

The brightest star in our parental crown is our boy. How sweetly we cherish the first articulations of the prattling tongue and how cheerfully and gladly we watch the first efforts of his staggering little feet. It is at this juncture that, parentally, our air castles begin to form, we begin to silently muse that in a sweet day to come he will fill some official position of honor and credit, such as mayor, squire, sheriff, judge, representative or congressman. Then there is the shuddering sensation that the chair of the Governor and President must be filled and some mother's and father's baby boy will fill them.

This sweet springtime picture has two sides—bliss on one side, sorrow on the other. A road to a crown of honor—a diadem of woe. Parents alone know these two roads. There is a juncture in the boy's life where the forks of this road are encountered. The right hand road is paved with good deeds, industry, thrift, morality, courage, labor, proper hours, courtesy, attention, religion, etc. The other is paved with immortality, late, irregular hours, strong drink, swindling, embezzlement, forgery, gambling and general debauchery.

The former is full of labor and pull, alertness and determination. The latter is to turn loose and fall.

Has our boy come to this fork of the road? If so, what? Just here is where parental "bumfuzzlement" begins. The boy begins to assert his rights, make his demands and execute them. The loving parent begins to indulge; "O how I love my boy! I can't deny him just this little concession." This concession begats more and similar concessions with the rapidity of arithmetical progression. The links of the chain are formed and the boy's character is forged. Often the making of two chains is started—one link welded in the good—two links in the bad.

Let us stop and ponder well. Do we love our boy rightly when we make concessions and indulge the innocent lad? No! decidedly! The tender, sweet-hearted boy does not know anything but what he has been taught, therefore, how can he be responsible for the deeds he does? Where, then, does this responsibility rest? Directly on the shoulders of the father and mother. What is to be done in the premises? Place this boy on the road to honor, stand behind him and see that he stays in the middle of the road. If it takes the most rigid discipline, exercise it. Remember, parents that every day you are farther from the forks of the road and that your parental watchfulness will be less needed as the boy's chain of character is forged.

When time-honored hairs of silver gray deck our temples, how proud will we be to present such a boy to the world and say: "This is the crowning effort of my life, the transformed prattling babe of former days." How gladly the smile of declining days will play over our time worn cheeks as we commend our treasure to the world to begin where we leave off. Then our boy will be a solid rock of support for our evening years, and a joyous treasure to leave behind as we take our flight to the great unknown.

If we allow our boy to go to the other road, what? The story is more easily imagined than told. The pain is great enough without a word picture.—Uncle Josh, in Farm and Ranch.

Not Wash-Day—But Wash-Hour

The woman, who uses THE "NEW CENTURY" has the clothes on the line and is ready for her morning shopping or recreation—when other women are still toiling over the tubs in a hot kitchen.

The "NEW CENTURY" washes a tubful of clothes in five minutes—washes them cleaner than can be done by hand.

Do your washing in the "New Century" way and change wash-day to wash-hour. Our booklet tells how. Sent free.

CUMMER-DOWSWELL LIMITED, - - HAMILTON, Ont.

Cheerfulness.

Cheerfulness is like a sunny day, it sheds its brightness on everything around us. No trait of character is more valuable, or more productive of happiness, than cheerfulness; it lightens our burdens, multiplies our friends and promotes our health.

Cheerfulness may do much to lighten our burdens, and thus make life happy. Times may be hard, but wearing a sad and gloomy countenance will make them no easier. It is sunshine, not clouds, that brings out the flowers. Sorrows will surely come, but softened by the hopeful views of a cheerful disposition, they appear less fearful and less depressing.

Cheerfulness makes the air seem more balmy, the sky clearer, and even the sunshine more beautiful; while gloominess is a mildew that blights our talents, blasts our happiness and beclouds our life.

Again, social intercourse is one of the chief sources of our happiness, and nothing so fits us for the enjoyment as cheerfulness. The possessor of this frame of mind is not only free and easy in conversation and manner, but has his imagination clear and his judgment undisturbed. He is disposed to be polite and obliging, and naturally awakens similar feelings in those with whom he comes in contact—as the soft rain falling gently on the earth, penetrates the soil and endues all nature with freshness and beauty, so the influence of his genial disposition permeates all hearts and fills them with joy and gladness; in this atmosphere of happiness that he has created, he breathes the sweetest joys of life.

Cheerfulness not only lightens the burdens of life and increases social pleasures, but it also promotes health. It affects beneficially, not the mind alone, but likewise the body. If in ill health, we give way to repining, we encourage the malady; while, if we brace up, we banish our fretful passions and with them a large part of our trouble. If we continually worry over our sorrows, we cause our mental faculties to become dull and languid; so, if we keep in mind our bodily afflictions, we imperceptibly injure the delicate nerves and tissues of our bodies. On the contrary, if we banish all thoughts of our ailments or troubles, we raise our spirits and promote our health.

Seeing, then, that cheerfulness is productive of so much happiness and good, let us endeavor—no matter how dark the gloom may be—to help brighten it by smiles.—CARRIE E. GUY.

Three Good Answers to the Questions.

WHAT IS GOOD HOUSEKEEPING.

FIRST ANSWER.

Good housekeeping is the art of making the home restful, cheerful, comfortable and clean. Of ministering to heart, mind and body in a reasonable, common sense way; giving a variety of careful chosen, well-cooked food, and making details of meals and service either simple or luxurious, according to the family income.

SECOND ANSWER.

Good housekeeping is the "gift of God" by which some women transform a house into a home. It is more than a knowledge of the chemistry of cooking, more than the care of silver, china, hardwood floors or bric-a-brac, though it may include all these. It is that subtle something by which order, cleanliness, beauty and comfort are made to reign simultaneously in the home.

THIRD ANSWER.

By good housekeeping I mean all that which, planned and carried into effect by the home makers, aims to so control the physical, direct the mental and influence the spiritual life of every member of the household, that he or she may reach the highest possible plane of usefulness and happiness.

Lemons.

Lemons are very useful in health and sickness. Hot lemonade is one of the best remedies for an incipient cold. It is also excellent in cases of biliousness. For malaria the "Roman cure" is prepared by cutting the rind and pulp of a lemon into a pint of water, then boiling until there is only a half pint. One teaspoonful is taken before each meal. This has cured obstinate cases when quinine failed. Lemon syrup made by baking a lemon twenty minutes and then squeezing the juice upon half a cupful of sugar is excellent for hoarseness and to break up a cold. Tie a piece of lemon on a corn at night for five nights, leaving it on all night. Soak the foot in warm water and the corn can be easily removed. When the root of the corn is taken out cover the toe with collodion or some other preparation to protect the skin, which will be sensitive. Unless the tender skin is protected it will soon form another corn. A piece of cotton saturated with vaseline and put over the toe will doubtless protect it just as well.

MORE BUTTER AND BETTER BUTTER

Farmers say that the "FAVORITE" CHURN gets more butter out of the cream than any other. That makes the "FAVORITE" more than pay for itself.

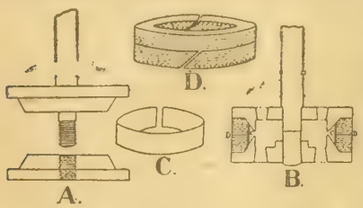
The "FAVORITE" churns **smoother** butter, too—better butter.

Easiest running because of roller bearings—strong, durable—with hand lever and foot tread. 8 sizes, to churn from ½ to 30 gallons of cream.

Every woman, who washes clothes, ought to have a "PURITAN" WASHER.

If your dealer does not handle the "FAVORITE" or "PURITAN", write us.

DAVID MAXWELL & SONS, - ST. MARY'S, ONT.



Above is a cut of the piston of the

'Perfect' Spray Pumps

This piston is made in such a way that the packing can be adjusted to any degree of tightness, without removing the pump from the barrel, all that is necessary being to withdraw the bolt from the lever. The packing is of fiberous material, lubricated with graphite and will wear for years.

FLORICULTURE.

All inquiries in this department will be answered by H. E. Goold, Florist, Sussex, N B.

A FARMER reader at Lower Newcastle, N. B., wishes to know what to do with Chrysantheum when done blooming.

ANS.—This plant exhausts its vitality in blooming and should be cut down to the pot and roots put away in a dark, cool place, until February, keeping it on the dry side, then bring to light. Water and root sprouts will come up, from which, when a few inches high, take cuttings and root them in moist sand or soil. These cuttings will give you good blooming plants next autumn, but must be kept growing, without check, from start to finish, to give good bloom.

Another reader wishes to know when stimulants or plant food should be given plants. I have answered this several times, but will again give my opinion. No plant in pots or boxes should be given food or stimulants until the ball of soil is crowded with roots and nearly exhausted of food. To feed a plant when it has already sufficient food, is to invite disease. At this season of the year, dark weather and short days, no stimulants should be given, except in cases of some strong, rank growing plant, that is wholly root bound. Better wait until the February sun gives light enough to enable the plants to assimilate more food, and in watering the plants during the dark period, it is also better to keep on the dry side, unless your plants are kept in a high temperature. If you have a plant crowded with roots, that needs moving, and it is not convenient to repot it into a larger pot, wash (not shake) all the soil off the roots and repot, with fresh soil, into the same or a smaller pot.

As soon as your forcing bulbs are thoroughly rooted and ready to bring to the light, see that the drainage is perfect in each pot or box, as, if it is stopped, they will rot. If kept moist, they should be in full bloom. Keep them cool during forcing—a high temperature gives poor bloom. Give all the air you can to all your plants.

In answer to FARMER reader of Hampton, Dalhias can be wintered in any position in which potatoes will keep well. Keep in a cool, dry position, free from frost.

If you have covered your tubers with earth, in a cool position, free from moisture, they will keep all right, but will start to grow early in the spring. If moisture can reach them in the soil, they may rot. Look at them and care for them now.

Roses grown in houses in winter need air and all the sun you can give them and good drainage. Spray or wash the foliage every sunny day, to guard against red spider and never let them wholly dry out. When in active growth, keep moist, but do not let water stand under the pots in saucers. This last applies to all plants not aquaties.

In answer to Oban, C. B., the insect on your Chrysanthum is Aphis. Make a large paper cone, place over plant, cut a few ounces of tobacco fine, moisten it and burn on coals, held so the smoke will go under the cone. This will kill them; or make a strong tea of the tobacco and dip your plant in or spray it on the plant repeatedly.

Only requires 1 man

Lighter Draft, Better Results

The Aspinwall No. 3 Potato Planter is not a two-man machine. It only requires one man, saving you the extra man's wages. It is lighter draft, too. And will plant one-third faster. No other potato planter can compare with it in accuracy. The Aspinwall No. 3 drops over 99 per cent. good. And does it without slightest injury to the seed. We've put seed through the planter over fifty times and it produced as good results as seed planted by hand. No change of pickers required for different sizes of seed or different distances of planting.

Get our catalog J2 explaining detailed construction of Aspinwall No. 3, which is made by largest makers of potato machinery in the world.

Bowmanville, Ont.

The Georgetown Seed Fair

The first Seed Fair for Kings County, P. E. I., was opened in the hall at Georgetown on Monday, March 7th, by His Honor Lieutenant Governor McKinnon.

As the judges proceeded with the placing of awards in the hall the afternoon program was carried out at the Court House. Hon. John Richards, Commissioner of Agriculture presided. He congratulated the people on holding the Fair and spoke of the benefits resulting from the selection and use of good seed and the necessity of growing our own seeds. He also made special reference to the growing of clover seed saying that if there were a sufficient number of farmers went into the growing of the clover for seed that the department would consider the assisting in geting a clover huller, an expensive machine indispensable in the cleaning of clover seed.

J. E. Sinclair was the next speaker. He gave an account of agricultural methods as practised in Denmark especially the hog raising industry and its relation to dairy farming.

J. A. Clark, Superintendent of the Experimental Farm, gave a description of what he intends doing in the farm along experimental lines. He spoke on the "Benefit and Value of Good Seed to the Farmer" describing in detail the methods used for prevention of smut in grain recommending a solution composed of 1 pint formalin to 40 gallons water, enough to treat 50 bus. oats.

At a meeting at the hall at 5 p. m. the judges explained reason for placing awards under different exhibits. S. J. Moore, Truro, assisted by J. A. Clark, judged the oats and timothy; R. Robertson Superintendent of the Experimental Farm at Nappan, N. S., Judged potatoes and Donald Innis, N. B., wheat and barley.

The evening session met at 7 p. m. with Mr. Annear, President of the King's County Exhibition Association in the chair. First was an address given by His Honor Lieutenant Governor McKinnon followed by Hon. John Richards, Hon. Laughlin McDonald, Murdock McKinnon, M. L. A., Hon. J. D. Innis. On arrival of train from Charlottetown, Premier Hazzard and J. A. Matherson arrived and made stirring addresses.

The Premier emphasized the necessity of eradicating weeds from the farms as an essential step towards producing pure seed.

Prof. Ross then gave a stirring and enthusiastic address urging the farmers to stop the short sighted policy of selling their farms away in pieces by exporting oats and other raw products.

Prof. Robertson, of Nappan, followed in an earnest speech, that in his opinion successful farming should have live stock as the basis of the operation and that a short rotation of crops was very essential to successful live stock farming.

Meeting closed with a vote of thanks to chairman and the singing of the National Anthem.

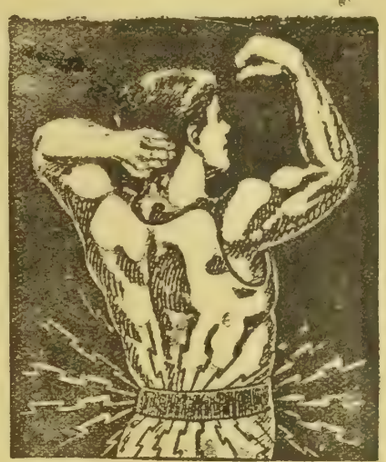
Perpetual Youth

Let Me Tell you How to Regain All Your Old Vim, Vigor and Manly Strength. Be a "Health Belt Man." Feel Young for Balance of Your Life. Age Doesn't Count if You Have the Vitality.



"I could shout for joy. After years of Weakness and Debility, your Wonderful Health Belt Cured Me. I Am a Man Again. Use My Name as You See Fit."

Leon Turpinat,
Stellarton, N. S.

Perpetual youth. This is precisely what I mean. I say as man to man give my Health Belt a reasonable chance, and it will carry you through any business, mental or physical strain you may be under. It doesn't stimulate; it simply adds the electro-tonic element to your bone, nerves, tissue and blood; all the force and strength which has been drained from your system by some earlier indiscretion. My Health Belt is essentially a strength giver. It overcomes the private symptoms of weakness in men, which sap the vitality. If you are nervous and lack manly vigor, you are passing away thousands of brain cells every day. Ask your physician if this is not true. I stop this awful, weakening process. You wear my health Belt nights; while sleeping a great stream of soft electricity passes into your body at the small of the back; it cures backache in one application; you feel better immedately; inside of an hour; two months will make a new man of you. No drugs; no privations; no restrictions except that you must give up all dissipation. Follow my advice and I promise you will feel younger and look younger. Let me restore your vitality, and you will be able to face the world with new ambitions. The Health Belt cures other ailments too. A positive remedy for rheumatism in any part of the body, sciatica, lumbago, kidney, liver, stomach disorders.

Special attachments furnished, and worn by women as well as men.

Free Until Cured. Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash, if you prefer to deal that way.

Let Me Send You These Two Books FREE.

They fully describe my Health Belt, and contain much valuable information. One is called "Health in Nature," and deals with various ailments, common to both men and women. The other, "Strength, the Glory of Man," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If you are near this City, take time to drop in at my office that you may see, examine and try the Belt, No charge for professional advice either at my office or by mail If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for anyone needing a new vigor.

Tried and Proved Receipes.

WHEN REPLACING A CANE SEAT—Old chairs take on a new lease of life when fiber seats replace worn-out cane ones, but these seats so easily tacked on with brass-headed naiis, do not always fit. I cut a paper pattern to fit the chair and paste it on the bottom of the fiber seat, which I then take to a shoemaker to trim to the right size.

CHEESE STRAWS.—Chop finely with a silver knife one tablespoonful of butter with a cup of flour, add a half-teaspoonful of paprika and a cup of grated cheese; add enough water to make a stiff paste. Roll out very thin and cut into even strips about half an inch wide and six or seven inches long. Place on a wet tin and bake in a very quick oven; immediately upon removing sprinkle with salt.

SOFT SUGAR COOKIES.—Cream together a cup of sugar and half a cup of butter; add to this one egg beaten to a stiff froth, five tablespoonfuls of milk, small teaspoonful of baking powder, the juice of one lemon and sufficient flour to make it of rolling consistency, but yet as soft as possible. Do not use any more flour than can be helped. Handle as little as possible and bake it in a quick oven. They are delicious.

MONKEY FACES.—Cream together one half cup of butter and one cup of sugar, add to this two eggs beaten to a stiff froth, a cup of molasses with two teaspoonfuls of soda mixed in it, a cup of cold water, a teaspoonful of cinnamon, one of cloves and five cups of flour. Beat well together and then drop from a tablespoon upon tins; add three raisins for the eyes and nose after the batter is in place, and then bake in a fairly quick oven. Children delight in them.

A Safeguard As Well As A Cure

The trouble with most cough medicines is that they relieve the cough simply by soothing the local irritation. They help Nature very little in *curing* the inflamed conditions, and do nothing at all toward *strengthening* the weakened parts.

Father Morriscy's No. 10 does all three. It *stops* the cough by clearing away the mucus and relieving the irritation in the passages—it *cures* the inflamed and congested membranes lining the throat and lungs—and it *strengthens* the whole system, and particularly the parts that have been weakened.

Thus it is that No. 10 not only cures the present trouble, but prevents its return.

Hundreds of men and women who were broken down with coughs and colds, and either on the verge of consumption or actually in its grip, are now strong and well, thanks to Father Morriscy's No. 10 and careful living.

Trial size 25c. Regular size 50c.

Molassine Meal

The unique and wonderful food for

Horses, Cattle, Sheep, Pigs, & Poultry

Are you using it? If not you are behind the times.

—SOLE IMPORTER—

Andrew Watson.

91 Youville Square, - MONTREAL.

A useful stove blackening (liquid) is composed of one gill of turpentine, one pound of black lead (pulverised), one gill of water, and one ounce of sugar.

A piece of flannel wrung out of boiling water and sprinkled over with turpentine will often give a cold relief, if laid on the chest.

BE PREPARED FOR THE HARVEST WITH THE RIGHT MACHINE

YOU cannot afford to run any risk of delay at harvest time. Every minute counts when the grain is ripe for cutting. Every minute of delay due to a slow, inefficient bungling or broken-down machine will rob you of a part of your just reward. Let the harvest find you prepared. Start today to look over your equipment. Face the question squarely.

Is it going to permit you to get all the profits from your acres. If it is not—now is the time to choose the machine that will. Because you are going to be busier every day from now on.

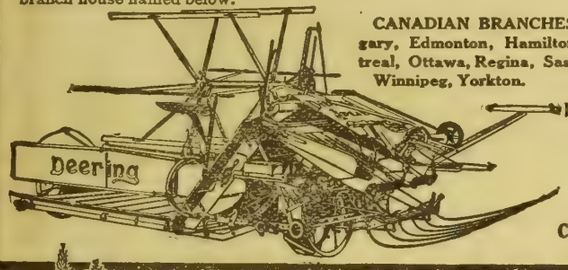
We want you to take proper time to make your selection because we know if you do you'll want a Deering. It's one of the best machines for your use. It's built to meet the conditions encountered on Canadian farms.

It will get all your grain no matter if it is tangled or down in the shortest possible time. It has strength, a wide range of adjustment for all conditions of grain and ground surface, and the draft is as light as it is possible to secure in a perfect working binder.

It is a proved machine. It has been in use for more than a generation, and its superior has never been produced. You cannot make a mistake in purchasing one. The Deering line comprises—

Harvesting Machines, Binder Twine, Mowers, Tedders, Hay Rakes and Side Delivery Rakes, Hay Loaders, Disk, Shoe and Hoe Drills, Cultivators, Seeders, Smoothing, Spring Tooth and Disk Harrows, Land Rollers, Scufflers. Deering agents also handle Gasoline Engines, Cream Separators, Hay Presses, Wagons, Sleighs and Manure Spreaders.

Call on the local agent for catalogue and particulars on any Deering machine or implement, or write the International Harvester Company of America at the nearest branch house named below:



CANADIAN BRANCHES: Brandon, Calgary, Edmonton, Hamilton, London, Montreal, Ottawa, Regina, Saskatoon, St. John, Winnipeg, Yorkton.

INTERNATIONAL HARVESTER COMPANY OF AMERICA (Incorporated) CHICAGO U S A

This Serviceable "Swiss" Army Rifle For $3.50

We have in stock about twenty of these "Swiss" Army Rifles which we would like to dispose of. Having purchased a large number of these rifles for premium purposes we necessarily got them at a bargain and are now offering them to you at wholesale prices. The shooting season is over and we do not want to carry so many in stock. They retail at all hardware stores for about $6.00 each. Ammunition for these rifles is cheap and can be obtained at almost any hardware store in the provinces. If your dealer does not keep it we can get it for you- Every farmer should have a rifle and this is your opportunity. Better send for one to-day. They will not last long at the price quoted, $3.50. Orders filled in rotation. If all are sold when your order is received money will be refunded. Order to-day. Cash must accompany order. If you send check add 25c for exchange.

Prince Edward Island Provincial Seed Fair.

(Continued from page 309.)

length and breadth of the land spreading the good work that must necessarily ensue from the gathering together of our good ladies for helpfulness in maintaining and upbuilding our homes.

Mayor Morrison, of Summerside, extended in behalf of the town a hearty welcome to the visitors.

HIS HONOR LIEUTENANT GOVERNOR MCKINNON.

was present and delivered an encouraging address. In regard to agricultural education, he said it had two objects in view viz: improvment of quality and improvment of where education was applied to our every day practical work. He gave some comparative crop statistics which showed that Prince Edward Island was more than holding her own with the other provinces of the Dominion. He thought there should be more co-operation in the ownership of expensive farm machinery and that more of the implements used should be manufactured in Prince Edward Island.

BETTER SPEND $1.00 ON YOUR BOY IN EDUCATION THAN LEAVE HIM $10.00.

American Consul Deedmeyer was present and said that the uneducated man was almost sure to lose in the race, consequently it behoved farmers to give their boys and girls every possible educational advantage. It was much better to spend one dollar on the education of a boy than to leave him a legacy of ten dollars. Children should be trained to study a certain number of hours each day and to work onwards and upwards along moral and intellectual lines.

After short addresses by Hon. Mr. Mathieson, Hon. John Richards, Prof. Cumming, Hon. Mr. McLean, and Hon. Mr. McDonald the meeting closed.

THE WOMENS CONVENTION.

The Womens Convention was held in St. Pauls Hall on Thursday, March 10th. Mrs. R. T. Holman acted as chairman and the following proggramme was carried out:

"Talk on Beef Cuts': by Miss Grace Dutcher, Charlottetown.

"Arts and Handicrafts in the Home" by Miss Carrie Holman.

"Home Sanitation" by Miss Katie James, Summerside.

"Labor Saving Devices" by Miss Dutcher, and an address by Mr. Deedmeyer. Some interesting discussion took place, the meetings were largely attended and all felt that the day was profitably spent. Some of the addresses will appear in future issues of the Farmer.

EXPLANATION OF AWARDS.

The explanation of awards and auction sale took place on Friday morning. The explanations as well as the prices realized at the sale were considered very satisfactory. Owing to the danger of getting different varieties and strains of seed grain mixed it was resolved that in future a glass quart jar accompany each entry. The judges will label the jars and fill them from the respective bags after which the bags will be tied. The respective samples in the jars can then be examined without incurring the liability of intermixing the grains. After the passing if this resolution the 1910 seed fair was closed.

Equal parts of water and vinegar rubbed into the hair one half hour before washing will take out the dandruff. Rub the same occasionally well into the scalp at bed time.

SEED OATS.

Start in right now as a seed grain grower. Use every care in preparing the soil. Procure some of our Regenerated Banner Scotch grown Oats, and you will find that not only will you increase your yields by 10 to 30 per cent. as our last year's customers did, but also will your neighbors come to you each season for your seed, and pay you high prices. It costs no more in land, labor, horse flesh or machinery to grow our best seed than common run-out seed, but the prices and yields obtainable are very different. We offer these oats, while the stock lasts, freight paid, at **$1.50** per bushel, in 5 bushel lots. Bags free. Send for samples also catalogue.

Clovers & Timothy

Below find our present prices for guaranteed **No. 1 Government Standard** Clovers and Timothy, delivered, freight paid, at your nearest station, provided you order 200 lbs. or over. Bags 25c each extra.

Send for Samples.

Red Clover, "Sun" Brand, at $11.00 per bushel, (60 pounds.)
Red Clover, "Moon" Brand, at $10.25 per bushel, (60 pounds.)
Mammoth, "Sun" Brand, at $11.00 per bushel, (60 pounds.)
Mammoth, "Moon" Brand, at $10.52 per bushel.
Alsike, "Ocean" Brand, at $9.50 per bushel.
Alfalfa, "Gold" Brand, at $13.40 per bushel.
Timothy, "Diamond" Brand, at $3.75 per bushel, (48 pounds.)
Timothy, "Crescent" Brand, at $3.25 per bushel, (48 pounds.)

An interesting story, relating the facts that a farmer found out about a Trade Mark.

This is a plain, truthful story about a farmer who lost dollars—hundreds of them—by saving cents.

He knew how to farm—how to get every quarter out of his cattle and the soil.

But—there was *one* thing this farmer *did not know.*

He did not know as much about *Bird Neponset Products* as he should. He did not know that the Trade Mark you see in this announcement was a guarantee of lasting quality—*a guarantee just as good as gold.* So he roofed his barn with a roofing *very similar in appearance* to Paroid Roofing. It cost just as much to apply that roofing as it would have cost to apply Paroid, and, when applied, it *looked* good. It even looked fairly good at the end of *the first* season's wear. But during the second winter Jack Frost *bit* into it, April Showers *soaked* it. The hot summer sun *blistered it.* Fall's driving rains *swept through it.* A two years' test reduced this handsome roofing into *a mushy, leaky business that called for a new roof.*

Then this farmer investigated the roofing question. He *discovered* that *Bird Neponset Products had* stood *the test of time*—that Paroid Roofing is no uncertainty. He found out that the "*Little Girl*" and the name "Neponset" was *the century-old* firm's guarantee of *Quality* and *Durability.* It's easy to figure out how he lost *considerable* money on his barn alone. He also lost money on his poultry shed. And he was mighty lucky that he *didn't lose more* on both. But, he was *a philosopher* as well as a farmer. He ripped off the "Just as good" roofing and covered his buildings with Paroid. Let him finish the story: "A man who pays attention to his business on the farm *can make money.* But when it comes to erecting or repairing buildings it's the easiest thing in the world to waste hundreds of dollars. *The important thing* about farm buildings *IS the right roofing.* The *wrong* roofing is never worth its first cost—never worth laying. Because I was fooled once I *investigated* the roofing question, now I know. Take my advice, when building or repairing, look for the "Little Girl" Trade Mark—before buying roofing. That Trade Mark is on every roll of

MADE IN CANADA

PAROID ROOFING

—an absolute guarantee of value based on the time test—the only test there is—for a roofing. F. W. Bird & Son are the originators of the complete Roofing Kit—there's cement, nails, rust-proof caps and complete directions for laying in each roll of Paroid.

OUR OFFER: **When you see Paroid on your roof—if it is not satisfactory tell us and we will send you a check for the cost of the roofing and the cost of applying it. If any BIRD NEPONSET PRODUCT ever proves defective in manufacture we will replace it. If a broader guarantee than this could be made we would make it.**

N. B. **Write to our Building Counsel Department for free information concerning any building problem you may have to solve. Give full particulars, and state exact dimensions.**

The machine which is warranted to give satisfaction. Runs on Ball Bearings. Easiest worked and most satisfactory machine on the market.

Write to-day for booklet. We can supply you to any station in Canada.

J. H. CONNOR & SON, Limited, OTTAWA, ONTARIO

Had Weak Back.

Would Often Lie in Bed For Days, Scarcely Able To Turn Herself.

Mrs. Arch. Schnare, Black Point, N.B., writes:—"For years I was troubled with weak back. Oftentimes I have lain in bed for days, being scarcely able to turn myself, and I have also been a great sufferer while trying to perform my household duties. I had doctors attending me without avail and tried liniments and plasters, but nothing seemed to do me any good. I was about to give up in despair when my husband induced me to try Doan's Kidney Pills, and after using two boxes I am now well and able to do my work. I am positive Doan's Kidney Pills are all that you claim for them, and I would advise all kidney sufferers to give them a fair trial."

DOAN'S KIDNEY PILLS are a purely vegetable medicine, realizing quick, permanent relief, without any after ill effects. A medicine that will absolutely cure Backache and all forms of Kidney and Bladder Disease.

Price, 50 cents per box, or 3 for $1.25, at all dealers or The T. Milburn Co., Limited, Toronto. Ont.

In ordering specify "Doan's."

Send $6.95

THE ST. JOHN Business COLLEGE

S. KERR, Principal.

SHEEP-RAISING AS A BUSINESS

The mild Winter in Nova Scotia has been very favorable to the growth of the fine soft wool for which the Province is famous. The Manager of the Hewson Woolen Mills is particularly happy over this condition of affairs, as his factory uses so much of this choice wool in Hewson Tweeds and Underwear. There are great opportunities for profitable sheep-raising in Nova Scotia.

Farm Problems.

Soft Wood Ashes.

SUBSCRIBER, KENT. Co., N. B.

1. What are soft wood ashes worth per barrel as a fertilizer?
2. Are they better and cheaper then lime at $1 20 per barrel?
3. What are ashes worth that are made at the end of a chute where all the refuse from a saw-mill is gathered and burned, but exposed to all rains and constant burning for three or four months?
4. Are they as valuable as ashes that are not exposed?
5. If not, what are they worth per barrel?
6. How many barrels of ashes are required per acre for the various root and grain crop?
7. How are they the best applied to be evenly distributed in the absence of a manure spreader?
8. Is the spring or fall the better time to apply them?
9. Are ashes to be left near the surface or well worked in with a disc harrow?
10. When would be best to sow on sod plowed last fall and disc harrowed when ashes are spread next spring. The land is a clay bottom but not wet, being well surface drained.

1. There is an impression that soft wood ashes are distinctly inferior to those of hard wood in potash content, but analysis made in the Farm Laboratories have not borne out this conclusion. Soft wood ashes are certainly lighter than those from hard wood and, consequently, bulk for bulk the former are not so valuable, but purchased by weight which is the only rational method there may be but little difference between them in fertilizing value.

Wood ashes of all kinds are quite variable as to composition, due to a number of causes, such as the presence of sand, of excessive moisture—and it is for this reason that we always counsel having an analysis made of a thoroughly representative sample before buying.

It must not be inferred from what has been said that the ashes from all woods are similar in composition. Such is not the case. What we wish to emphasize is that the contention that soft wood ashes are necessarily poor, is incorrect.

2. Without the knowledge of the weight of a barrel of the ashes and of their percentage of potash, it is impossible to say what the value may be, but supposing them to be unleached, tolerably free from sand or other inert matter and fairly dry, they should be considerably more valuable than a similar weight of lime.

3. This question can only be satisfactorily answered by an analysis. If the leaching has been at all severe and long continued and the ashes are now wet, they may not contain 1 per cent. of potash. In such a case they would not be worth more than the expense entailed in a short haul.

4. The application may be from 40 to 80 bushels per acre, according to the present condition of the soil, the nature of the crop to be grown, etc.

5. If fairly dry, the ashes may be distributed from the wagon box by a shovel, chosing a windless day for the work.

6. Ashes may be applied at any time, but on the whole spring is to be preferred, as this entails less risk of "washing" from the surface of the land Their potash is immediately available and consequently can be utilized by the crops of the season in which they are applied.

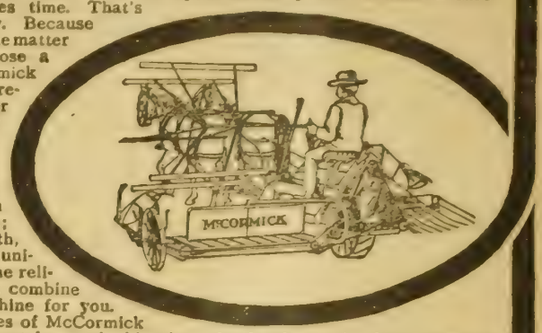
7. We advocate spreading them on the well prepared land in the spring previous to seeding and incorporating them with the surface soil with a smoothing harrow. There is no advantage in burying the ashes, but rather the reverse.

8. We think that corn, potatoes or other vegetable crops would derive more benefit, that is, give a better response, than the cereals. Leafy crops, in general, are particularly benefitted by potash, the chief fertilizing element supplied by wood ashes.—FRANK T. SHUTEX.

START TODAY TO GET READY FOR HARVEST TIME

DON'T put it off any longer. From now on 'till harvest you are going to be busier every day. Your grain is likely to ripen all at once. Then you'll want to cut it quickly. You can't do it unless you are prepared with the best harvesting machines—in proper condition.

To be sure of getting the best machine for your needs—you must make a careful selection. That takes time. That's why we say start today. Because we know if you go into the matter carefully you will choose a McCormick. The McCormick Binder will meet your requirements as no other machine will. It is built to meet the conditions encountered on the Canadian farm. It has stood the test of years. Its capacity to handle grain that is tangled or down; its simplicity, strength, durability, light draft, uniform, good work and the reliable work of its knotter, combine to make it the best machine for you.



Other farm machines of McCormick make, a long line, are not less valuable than the Binder. The line includes: Harvesting Machines, Binder Twine, Mowers, Tedders, Hay Rakes and Side Delivery Rakes, Hay Loaders, Disk, Shoe and Hoe Drills, Cultivators and Seeders, Smoothing Spring Tooth and Disk Harrows, Land Rollers and Scufflers. McCormick dealers also handle Gasoline Engines, Cream Separators, Hay Presses, Wagons, Sleighs and Manure Spreaders.

Every McCormick everywhere is recognized by farmers as a leader in its class. But we don't ask you to take our word for this. We say—Start today to investigate so you will have time to make a proper decision.

For catalogue and specific information on any McCormick machine, call on the local dealer or write direct to nearest branch house.

BRUCE'S SEEDS

Sixty Years of Success.

We are this year celebrating the 60th anniversary of the establishment of this business, and we are justly proud of its record, one which has been attained by very few seed houses in America.

The excellence of our stocks, which are carefully tested for purity and germination, our long experience and connection with the best growers in the world, prices reasonable, consistent with the quality, and the great care exercised in every detail of our business, is the secret of our success; this, with our largely increasing trade, the trade of many that we have held year after year, and many unsolicited testimonials from our customers, substantiates our claim to be "The oldest and most reliable Seed House in Canada."

No better Seeds can be procured anywhere, even at ten times our price.

All we ask, from those who have not patronized us, is a trial.

FREE—Our handsomely illustrated 104 page Catalogue of Vegetable, Farm and Flower Seeds. Plants, Bulbs, Poultry Supplies, Garden Implements, etc. Free, for 1910. Send for it.

JOHN A. BRUCE & CO., LIMITED,

HAMILTON, - - - ONTARIO

Displaced Patella.

SUBSCRIBER, ANTIGONISH CO., N. S.

Three year old mare when taken out of stable, streches out leg and brings it forward with a jerk for a few steps. Will be all right for two weeks or so, when it will be noticed again. What is the cause and cure?

The pathological condition is a displacement of the Patella, the small bone of the stifle joint caused sometimes by slipping in rising or by weakness in convalescing patients or lack of tenecity of structures and general debility at times from relaxation of tissue from want of exercise. Usually young animals with straight hocks and sloping croups are predisposed to this disease.

Treatment in some cases is very simple, a sudden jerk may be all that is required to draw the patella into place.

But this is not always sufficient, when not, attach a rope or strap to the fetlock, have an assistant draw the foot well forward, grasp the patella and push it upward, forward and inward and slip it in over the outside border of the trochlea of the former, when the bone slips into position the trouble is relieved and the animal may walk or trot without lameness. After treatment, cold bathing, keeping animal in large box stall loose, when not out. Exercising occassionally cures. Blistering, the part is frequently beneficial. For a blister, take one dram of mercury biniodide, two drains of pulverized cantharadies and one ounce of basatine, mix well, clip the hair off over the joint and rub the blister well, in 24 hours after grease, and after another 24 hours wash off and grease again then keep quiet in a box stall. Tie the head so as to keep the nose from the blistered part for 48 hours after applying and a week after give exercise daily. J. STANDISH, V. S.

MARKETS.

St. John Markets.

GRAIN—Oats, 52 to 53c; corn meal, $1.50 per bag.

GRASS SEED.—Timothy, $5.75 to $6.75; common red clover, 17 1-2c to 19c; mammoth red clover, 17 1-2c to 19c, alsike, 14 1-2c to 55c

LIVE STOCK—Milch cows, $30 to $60.

DRESSED MEATS.—Beef (carcass), 6c to 10c; beef, (retail) 10c to 22c; mutton, 5c to 6c; veal, 7c to 10c; lamb, $4 00 to $5 00; pork, 11c to 11 1-2c.

HORSES—Drafters, $200 to $300; roadsters, $150 to $250

DAIRY PRODUCTS—Creamery butter, 25c to 27c; dairy butter, 20c to 25c; cheese, 13c.

POULTRY AND POULTRY PRODUCTS,—Eggs, 22c to 25c; fowl, 80c to $1 60; turkeys, 20c to 25c.

FRUIT,—Apples, $1.50 to $5.00; honey, $1.10 per gal.; maple products, candy, 20c; sugar, 15c.

MISCELLANEOUS,—Beef hides, 10c; calfskins, 16c; sheep skins, 75c to $1.00

VEGETABLES—Carrots, $1.20 to $1.40; turnips, 65c to 80c; beets, $1.50

Charlottetown Market

GRAIN,—Oats, 42c white, 44c black.

DRSSED MEATS,—Beef (carcass) 6c to 8c; mutton, dressed, 7c to 9c; veal, 4½ to 6c; pork, 10¾ to 11¼c.

DAIRY PRODUCTS—Creamery butter, 25c; dairy butter, 20c; cheese, 12½ to 13c,

POULTRY AND POULTRY PRODUCTS.—Eggs, 22½c; fowl, 12c; chickens, 12c to 13c.

VEGETABLES.—Potatoes, 30c to 40c; turnips, 12c to 14c.

MISCELLANEOUS—Hay, pressed, $10.50; straw, $5.50 to $6.50; beef hides, 8c; calfskins, 12c; sheep skins, 80c to 90c.

There is not much change in prices or conditions since our last report. The principal change being in pork which is still advancing. Eggs are coming in fairly well and the prices will likely be lower. What we call Easter beef is selling at 5½c to 6c live weight. Oats are coming out slowly owing to the state of the roads There is not any large lots in dealers hands and some say not as many as we may think for sale in the farmers hands. Butter market is quiet and dull.

Halifax Prices.

GRAIN—Oats, 52c to 53c per bushel; buckwheat, 3½c to 4c per 100.

FEEDSTUFFS,—Bran, $25 50 per ton; shorts, $27.00 per ton; middlings, $28.00 per ton; oil cake, $2.20 per bag; cottonseed meal, $2.50 per bag; gluten meal, $1 50 per bag.

GRASS SEEDS.—Timothy, 6c,

DRESSED MEATS,—Beef (carcass), 8½c steers, 10c; beef (retail), 12c to 18c; mutton, 6½c to 7½c; veal, 6c to 7c; lamb, 11c cold storage; pork, 11c to 12c.

DAIRY PRODUCTS,—Creamery butter, 28c to 27c; dairy butter, tubs, 20c to 22c; prints, 22c to 23c; cheese, large, 13c to 13½c.

POULTRY AND POULTRY PRODUCTS—Eggs, 20c to 23c; fowl, 13c; chickens, 15c; ducks, 16c; turkeys, 17c to 18c,

FRUIT—Apples, $1 50 to $3.00; cranberries $9.00.

VEGETABLES,—Carrots, $1.75; potatoes, $1.25 to $1.35; turnips, 90c; beets, $1.75.

MISCELLANEOUS,—Hay, $14 00 to $15.00; straw, $9.00 to $10 00; wool, washed 21c, unwashed, 14c; beef hides, 8½c to 9c; calf skins, 14c to 15c; sheep skins, 5½c to 6c.

Pork higher, with prospects of still higher prices. Potatoes, owing to the West India market being so low a number of cars which were intended for export were offered for sale here at a low figure consequently causing a drop in price and sound lots have been sold the past week as low as $1.15 per three bushel bag, other vegetables remain firm at quotations.

Butter, the supply of creamery is short and prices are firm at quotations, dairy, 2 lb. prints are coming in very plentifully and stocks are accumulating, prices have shown a decline. good dairy in tubs is very scarce.

Eggs, prices are considerably lower due to continued mild weather and large recipts and still lower prices are looked for the first of next week.

Cheese, market is firm, stocks in hands of dealers are light for this time of year and an advance is looked for.

Glenwood Ranges are Made in St. John
No Better Ranges Made in Canada.

In our Glenwood Ranges we have a line that is equal to any stoves that are on the market. Our ranges have met the requirements of the people. We put material and workmanship in our Glenwood Ranges. We make Cabinet Glenwood, Glenwood E., Modern Glenwood, Glenwood Cook, besides Glenwood Oaks and Furnaces. Our ranges are built to wear and have stood the test. They have removable nickel that fastens with a patent spring removable grate, direct draft, short handle damper, long centres cut in two to prevent warping. These are a few of the qualities of our ranges. Space prevents us giving more. Watch our ad in each issue of the MARITIME FARMER and learn all about our ranges. Write for catalogue and prices.

As handsome as the best iron fence at less than the cost of cheap wood

Here's a neat, strong, durable fence that will add to the appearance of the handsomest city lawn and is cheap enough, close enough and strong enough for the farm. The

Peerless Lawn Fence

is made of heavy No. 9 steel spring wire, so it can never sag. It is carefully galvanized and coated with white enamel paint. No investment you can make will add so much to the appearance of your property.

Also a full line of poultry and farm fences and gates. Write for particulars.

THE BANWELL HOXIE WIRE FENCE CO., LTD., BOX K HAMILTON, ONT., WINNIPEG, MAN.

STOCK NOTES.

WALTER E EATON, writes:—I have lately sold to Glassburn Society, Antigonish, a nice roan bull and to East Dalhousie Society, Kings Co, a dainty red bull. The enquiries for bulls are quite numerous and I have the goods that are wanted.

EGGS FOR HATCHING.—The Glen View Poultry Yards after a very successful season at the fall and winter fairs and after culling out their pens everything but the very best are now offering run of pens eggs for hatching from their different varieties, at $2.00 per 15. They have several choice matings for which they are asking special prices. Poer hatchers will be duplicated free of charge. For full particulars re prices and matings send for catalogue to WALTER MCMONAGLE & SONS, Sussex, N. B.

SILVER CUP FOR WESTMORLAND POULTRY SHOW.—At a largely attended meeting of the Westmorland Poultry and Pet Stock Association held on the 8th inst. the Associatson was advised that Mr. J. W. Y. Smith would offer a silver cup for competition at the next show. The Association would like to see others follow. Some important changes were made in the prize list at the meeting and in order to arouse more interest among the farmer's utility classes will be formed at the next show. In classes where there are between 10 and 15 entries four cash prizes will be given as follows: 1st, $2.00, 2nd $1,50, 3rd $1.25, 4th $1 00. Where there are over 15 entries 6 prizes will be given adding a 5th of 75c and 50c. This will make the prizes offered by the local Association larger than any other Association in the Maritime Provinces. It was also decided to hold the next show in january, 1911, and arrangements will likely be made with the different Asscciations to hold the next shows in circuit which will reduce expenses of judging as an effort will be made to have the same judge attend all the shows. A large number have joined the Asscciation since the commencement of the present year and all interested in the poultry show will help the Association along by becoming members. The members intend making every effort to make the 1911 show bigger and better than any show ever held in the maritime provinces and will have this show open to the three provinces.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

Bliss M. Fawcett,
Sackville, - - N. B.

Barred P. Rocks.

Our claim to be the foremost breeders of this variety in Eastern Canada has been established by ten years of the keenest competition in the show ring with this class of birds. Our latest triumph at the Amherst Fair, winning, for the second time, the silver trophy for the best cock, hen, cockerel and pullet, of any variety, and the specials for the best shaped and the best colored bird of this kind, seals the fact. First cockerel, first pullet, first hen and second cock at Amherst means quality now. First cockerel, first hen, first pen and second cock at Halifax, all in one year, endorses it. Stock and eggs for sale. Satisfied patrons our aim.

CRAIG BROS., - Amherst, N. S.

Farmers, Attention!

bonus be made available for a period of five years.

* * *

Resolved that whereas the educational authorities are making an effort to introduce agricultural education into our public schools.

And whereas it is advisable that our farmers in general assembly convened, should suggest to our educational authorities our immediate wants in that direction.

* * *

Therefore resolved that in the opinion of this Association, our educational authorities represented by the U. N. B. and the Normal school with the assistance of the Department of Agriculture secure the services of experts to give practical instruction in our Grammar and other schools in milk testing, budding and grafting and such other instructions as may be feasably demonstrated and that the necessary apparatus be supplied for demonstrating such institutions.

Further resolved that the teachers of country schools be required to qualify as soon as possible so they may possess sufficient practical knowledge to conduct school gardens.

* * *

Whereas in recent years epidemic diseases have not unfrequently occured in different communities in the province the cause of which has already been attributed to the use of impure or contamented water or milk supplies, and it is admitted that the regular periodical analysis by competent independent authority, of water, milk and other food supplies would at once detect impurities, prevent further use of some and afford a greater degree of protection to the health of our people generally.

And whereas there is now a demand by the Agricultural interests of this province for some promise in which shall give an opportunity for independent analysis of fertilizers and other articles in general by the farmers of this province in order to properly guard against adulteration and the use of inferior and detrimental articles

and whereas:—There is no established independent bacterio logical or chemical laboratory in this province available for the use of the public.

* * *

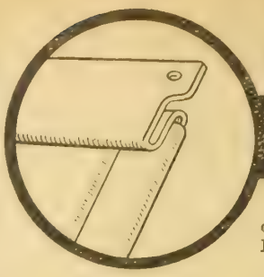
Therefore resolved.—That this Association urge upon the Government of this province the necessity for immediate establishment in connection with the University of New Brunswick a properly equipped chemical and bacteriological labratory, which shall be available for advice and assistance to the people of this province and any community and interest therein upon such reasonable terms and conditions as shall seem just and fair, and further resolved, that special committee be appointed by this Association to present the foregoing resolution to the Lieutenant Governer-in-Council and urge that the same be carried into effect as soon as possible.

Whereas the speech from the throne, at the opening of the Legislature, pledges the Government to introduce legislation to provide for the early construction of the St. John Valley railway by providing a Government guarantee of bonds.

* * *

Therefore resolved :—That this Association desires to express their gratification and approval of such legislation

Preston Steel Shingles are safe-locked on all four sides



TOP LOCK

You can only get the safe-lock construction in PRESTON Safe-Lock Shingles.

Look at picture of our side lock. See how the sides of the shingles hook over each other. This is on the principle of the sailor's grip. It is utterly impossible for shingles locked in this way to pull apart. The heavier the strain the firmer the grip.

The top of a shingle is where the greatest strain falls. Now look at our top lock. It is twice as strong as our wonderfully secure side lock. Notice that it consists of three thicknesses of sheet steel. The top of our shingle is unaffected by strains due to settling of building or shrinking of sheeting.

PRESTON Safe-Lock Shingles are proof against rain, snow, wind, frost and lightning. The only way to get PRESTON Safe-Lock Shingles off the roof is to remove the nails one by one and unlock each shingle separately. When you put PRESTON Shingles on your roof they are on to stay.

PRESTON Safe-Lock Shingles are the only shingles made and galvanized according to British Government Specifications. Shingles galvanized according to these specifications are good for twice the service of shingles galvanized in the ordinary way. They are also the only shingles with a Free Lightning Guarantee.

Send today for our free booklet "Truth About Roofing." We did intend to charge something for this booklet. But we will send it free as a reward to all who cut out, fill in and mail the coupon to us. Do it right now. 5

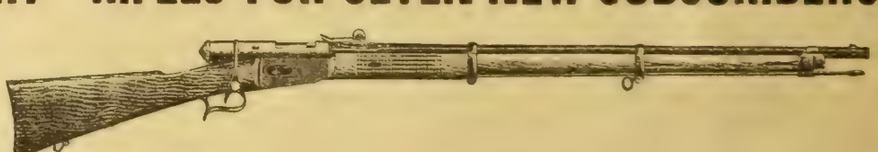
ONE OF THESE "SWISS ARMY" RIFLES FOR SEVEN NEW SUBSCRIBERS

We have purchased several hundred Swiss Army Rifles. They are repeating Rifles, holding 12 cartridges, 42 calibre, in the magazine and one in the chamber. The action is the reliable bolt type, and works quickly and smoothly. The barrel is rifled and is sighted for long ranges. The front sight is open and the rear sight adjustable for elevation. **Guaranteed perfect.** This is the famous "Swiss Army" rifle. It is splendid for hunting deer and larger game, etc. No one living in the country should be without one of these rifles. Only a limited number to be obtained. If you want one you should start to-day to secure seven new subscribers. If you intend earning a rifle drop us a card to-day and one will be reserved for you as long as they last. Don't delay, start to-day.



Address—**MARITIME FARMER, Sussex, N. B.**

and express the hopes that the construction may begin at as early a date as possible.

Whereas we believe that officers of this Association should be absolutely the choice of the majority of the members.

* * *

Therefore resolved that the election of officers should be carried out entirely by vote of the Association in a body.

Whereas it is advisable to add further to "The Dairy Industry Act" an act in addition to "The Dairy Industry Act" of 1904, relating to the testing of cream at creameries.

* * *

Therefore resolved :—1st. If a petition, signed by the majority of the patrons of any creamery, be forwarded to Hon. Minister of Agriculture, requesting an official test of composite samples of cream at said creamery, that the Hon. Minister of Agriculture shall give directions to a competent official of his department to make such tests.

2nd. Said official to be required to appear before a Magistrate or Notary Public, and make a sworn affidavit, that he shall carefully test such composite samples of cream in strict justice to all parties concerned.

3rd. Said official to be empowered to take a sworn affidavit of the proprietor or manager of said creamery and that the proprietor or manager of said creamery be required to make a sworn affidavit, before each testing time, to the effect, that he believes such composite samples of cream to have been carefully and intelligently collected and that said marked bottle contains an average of the cream sent by such patron as marked, since the last testing time.

4th. Said official shall continue to test monthly, or more often, if necessary, the composite samples of cream of said creamery, until two-thirds of the patrons of said creamery shall signify their desire that such official test shall cease.

5th. Clause (o) section (21) of "The Dairy Industry Act", relating to penalties shall apply to this addition.

6th. Forms of affidavit, etc., to be supplied by the Department of Agriculture

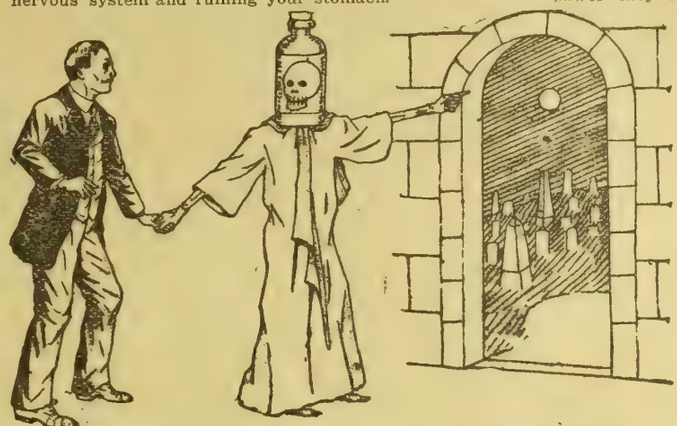
WEDNESDAY EVENING.

A talk on the home mixing of fertilizers, an address by Premier Hazen, the financial statement, showing a cost balance of $27.89, an interesting address on "Special vs. General Farming," by Fred. George, Sackville, which will be published in full in next issue, and discussions by Chas Peters, Geo. E. Baxter, Jno. McPhail, Mr. Hubbard and others, brought a most interesting and successful series of meetings to a close, and farmers returned to their homes determined, as was so ably stated by Mr. Chas. Peters, to advance along lines of Association and co-operation.

WHERE THE DRUG BOTTLE LEADS YOU

Ever wonder what kind of dope you are getting when your doctor gives you a prescription? If you ask him he will not give you a satisfactory reply. He might tell you some of the things in the prescription, but not all of them. There's a good reason why. If you knew you wouldn't take his dope and, of course, he couldn't afford to tell you the truth.

When a doctor gives a prescription to relieve pain or some chronic trouble he always puts in a little poison to deaden or stupefy the nerves. That's killing pain, or, rather, killing the nerves. Of course, if your ailment is of a chronic nature, the pain will come back and you must keep on taking the same drug or suffer. It stops the pain for a short time, but it is breaking down your nervous system and ruining your stomach.



The poisons that are used most frequently by the doctors are morphine, cocaine, mercury, arsenic and potash. The first two are used to stupefy the nerves and are responsible for thousands of drug fiends, who got the habit through the use of drugs containing dope for the relief of some chronic disease. Nature may cure the disease, but the drug habit stays with you always.

The last three poisons—mercury, arsenic and potash—are used in treating nearly all disorders and diseases of the blood, stomach and digestive organs.

You know mercury is quicksilver, and when it gets into the body it stays there. It destroys the digestive juices and eats out the lining of the stomach.

Arsenic weakens the digestive organs, makes the eyes weak, causes nervousness and inflames the stomach.

Potash destroys the walls of the stomach, produces terrible headaches, makes the blood thin and irritates the eyes, nose and throat.

The life of the nerves and organs of your body is electricity. If you are sick or ailing in any way it is because of the failure or breaking down of some vital organ. The reason any organ fails to do its work is because it lacks electricity. When it is doing its work right the stomach generates electricity for the support of the body and itself. When it is not able to generate the needed force it must have artificial aid. This is electricity, artificial electricity, as applied by Dr. McLaughlin's Electric Belt.

My method of curing disease is to go down to the very foundation of the trouble and remove the cause. When I have removed the cause, Nature will do the rest.

Electricity is a relief from the old system of drugging. It does by natural means what you expect drugs to do by unnatural means. It is Nature's way of curing disease, for it gives back to the nerves and organs the power they have lost, which is their life.

If you are skeptical, all I ask is reasonable security for the price of the Belt, and you can

PAY WHEN CURED

Dear Sir,—I got one of your Belts some time ago for a sore back, which was very painful, and prevented me from stooping so at times I could hardly tie my shoes. Your Belt strengthened my back and took the pain and soreness away entirely. I would not take $100 for it, and if I could not get another, I would not part with it at any price. I can recommend your Belt as a complete cure to all afflicted with this trouble.—W. McNeill, Colborne, Ont.

Dear Sir,—I wish to congratulate you on your success in inventing such a blessing to mankind, as your Electric Belt. I should have writen to you about my Belt before. I wore it only three weeks, then all the soreness in my back and thighs left me and my bowels became regular. Wishing you continued success in your business, I remain, W. G. Frizzell, Municipal Home, St. John, N.B.

FREE TO YOU

Get my 80-page book describing my treatment, and with illustrations of fully developed men and women, showing how it is applied.

This book tells in plain language many things you want to know and gives a lot of good, wholesome advice for men. I'll send this book, in plain wrapper, prepaid, free, if you will inclose this coupon.

I want to convince every sufferer that he can get benefit from my treatment. Nobody should be without it, for it is cheap enough, far cheaper than a course of doctoring, and I want everybody to try it. Let every one who can do so call at my office and make a full test of my battery, free of any charge.

If you can't call, send this coupon for my book.

Office hours—8 a.m. to 6 p.m.; Wed. and Sat. to 8.30 p.m.

M. K McLAUGHLIN
214 St. James St., Montreal, Can.

Dear Sir, — Please forward me one of your books, as advertised.

PUT UP THE HEAVY, HOG-PROOF

IDEAL WOVEN WIRE FENCE

You want a fence that is so heavy, stiff and strong that it will discourage any attempt at rooting. After an argument with the IDEAL your hogs will become thoroughly discouraged of trying to get under it. The IDEAL is undoubtedly the fence for you.

The IDEAL is the fence the railroads purchase because of its weight and quality. No. 9 hard steel wire throughout. Heaviest galvanizing on any fence. But the IDEAL lock is the BIG reason why you should buy the IDEAL fence. No lock equal to the IDEAL in gripping-tenacity has yet been discovered. Chances are there never will be. When stretched up, IDEAL is a very handsome fence. Every strand measures exactly true. Every lock is correctly applied. You see, the IDEAL is manufactured by the most improved fence machinery, in a plant that is considered a model among fence factories. With such superior manufacturing facilities the natural result is a fence overshadowing others in quality —and that is IDEAL fence. For further reasons read our free booklet.

Agents Wanted to Sell This Superior Fence

IDEAL Agents make the best living, because IDEAL Fence has the weight, strength and quality that make it sell easiest. Let us send you our money-making proposition.

THE McGREGOR-BANWELL FENCE CO., LIMITED, WALKERVILLE, ONT.

Chocking in Cattle.

This means the lodgment of foregin obstacle in the esophagus or gullet. It is known by slobbering, distressed breathing and accumulation of gas, which may be noticed on the left side or paunch.

The proper method of handling an animal thus afflicted is to stand the cow with her head down hill, pressing the head downward as much as possible while the attendant squeezes as much saliva out of the gullet as possible, then allow her to raise her head and give her one half pint of raw linseed oil, giving but one swallow at a time.

If she is not relieved from within ten to thirty minutes, a half inch rubber hose may be passed gently down the gullet. This will force the obstacle into the stomach, at the same time allowing the gas to escape.

If the animal has been greatly extended by gas before relieved, it may be necessary to give her a laxative and tonic to overcome partial paralysis of the bowels which sometimes follows.

Stoppage at the Point of the Teat.

A very common trouble in the ordinary dairy cow is to find an animal with the point of the teat closed, either due to a bruise of the teat itself or to infection of the milk duct which causes a little scab to form over the point of the teat and unless this is properly handled with care and cleanliness, the infection is apt to cause a loss of the entire quarter.

The proper manner in which to handle and treat such cases is to thoroughly wash the teat in an antiseptic solution, then dip a teat plug into a healing ointment and insert it into the point of the teat, allowing same to remain from one milking to another. In this manner closure of the point of the teats can be overcome in a very simple and satisfactory way.

Never use a milking tube if it can be possibly avoided as there is much danger of infecting the entire quarter by the use of the tube.

I H C CREAM HARVESTERS MEAN MORE THAN BREED OR FEED

Right breeding and right feeding are essential to the greatest milk production. But that alone does not mean greatest cow-profits. You must get all the butter-fat to put your cows on the biggest profit basis.

A "scrub" cream separator is kin to a "scrub" cow. You cannot expect big money-making results from either. You must buy the separator with a record—a pedigree—just as you buy pedigreed stock.

You want the separator that will skim to a trace; yet it must be simple enough to be kept perfectly sweet and clean—strong enough to last for years—accurately constructed and true, so it will turn most easily. And you want the machine that just meets your needs—not too large or too small—but just right.

For such a separator, look to the I H C line—backed by the I H C reputation for quality. For biggest dividends on your investment of good breed and feed—you must get one of the

I H C Cream Harvesters

All we ask is that you investigate thoroughly before you buy any cream separator. If you do that, you will soon own an I H C.

You will note their superior construction—their many special advantages. You will find that they are the only ones with dust-proof and milk-proof gearings. You will find in them the most perfect straining device—insuring pure cream and skim-milk always. You will see that the frame of an I H C is entirely protected from wear by bronze bushings at all points; that the I H C has largest shafts, bushings and bearings; that it has the safest, simplest, surest and most economical oiling system; that the flexible top bearing prevents vibration and keeps the bowl steady, no matter how unevenly the power is applied.

When you know what these money-making, money-saving advantages mean to you—you will own one of the I H C Cream Harvesters. There are eight sizes to choose from—four sizes in each of two styles—the Bluebell, gear drive—the Dairymaid, chain drive.

Call on your local dealer or write the International Harvester Company of America at nearest branch house for further information.

Lead Poisoning.

Lead poisoning in cattle usually takes place during the remodeling of buildings, painting of water tanks, fences etc., or even while painting houses, painters thoughtlessly scrape out the old paint pots and dump it out into the barn yard where cattle have access to, the result being that within a short time one or more animals are noticed to have a loss of appetite, shortage of milk, a depressed look, and later excited condition.

If permitted to run loose they are apt to go around in a circle, moan, press the head against fences or walls, indicating that the brain is effected, grate their teeth and act as if they were mad.

While the treatment for lead poisonis very unsatisfactory, it would be advisable to keep lead and paints out of the reach of cattle, rather than to permit them to come in contact with it and expect to save cattle thus afflicted.

Crop Bound in Fowls.

Crop-bound is usually caused by a piece of straw or some similar obstruction becoming clogged in the opening leading from the crop, and the latter organ becomes congested with food that is unmasticated, causing fermentation to set in, which increases the trouble.

The presence of such trouble is detected by the crop becoming very hard to the touch. Formerly treatment consists of giving a dose of castor oil and kneading the crop with thumb and fingers until it becomes soft. If the trouble does not succumb to this treatment, a more vigorous one consisting of cutting through the skin of the neck and through the crop itself, freeing it of its contents and then taking a few stitches in the crop and the opening made in the skin of the neck. Such an operation, however, is seldom performed except by an expert, and only then when the crop-bound fowl is a valuable bird. Recently a new and simple operation has been practiced with success. It consists chiefly of the free use of a good fountain

Bordeaux Mixture is a fungicide and Nico Soap in an absolutely sure death to sucking insects. Information will be sent you if you send your address to

BLACKIE BROS.,
Halifax, N. S.

Agents for the Deming Spray Pump—Send for catalogue.

Wanted Live Men.

We pay salary or commission. It all depends upon what you can do.

Each application will be dealt with as received.

Personal calls given priority.

We want men of brains—with energy.

Men, who want to make good and increase their earning capacity, who are too ambitious to drag along day after day in inferior positions.

We want several men of this class as travelling representatives of the MARITIME FARMER.

The MARITIME FARMER is an easy seller because nearly every farmer in the Maritime Provinces wants it when he sees it

To those capable of handling this proposition, we furnish with teams and pay a liberal salary.

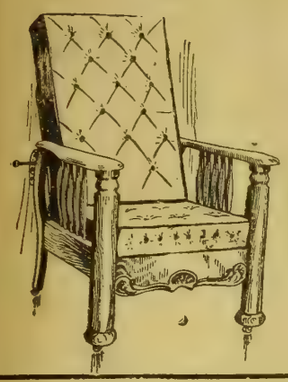
If you think you are of the right material and have a capacity for work, write us.

The Mariime Farmer,
Sussex, N. B.

Do You Need Furniture?

And Would You Like to Save From 15 to 25 Per Cent Off the Cost?

WRITE at once for our large illustrated **catalogue No. 8** showing 500 photographic pictures of the newest and best furniture on the market. Sent free to any address. Here are two examples of the big values in it:—



$8.50 for this Handsome Morris Chair

A sturdy, well-designed morris chair at a very moderate price. Frames are made of selected quarter-cut oak, highly polished and neatly carved; back is adjustable to four positions with brass adjusting rod. Two large reversible cushions with best velour coverings in choice of red, green or brown colors. Splendid valued this.

This Fine, Large, Comfortable Rocker, only $5.45

The frame of this rocker is selected oak with quarter-cut arms and carved front posts, all hand polished. Seat and back upholstered in best imitation leather with ruffled border, spring seat and buttoned back. Easily worth $10.00.

THE ADAMS FURNITURE CO., Limited,

Canada's Largest Home Furnishers. TORONTO, ONT.

syringe. A long piece of small rubber hose is attached to a can containing some very warm water. The can is set above the head of the fowl, so as to provide plenty of pressure. The free end of the hose is thrust down into the crop holding the fowl's head downward, and then turning on the water. The pressure will cause the crop to be washed out very much as one rinses a jug, and soon the contents will begin to wash out. The operation is not injurious to the fowl, and its performance requires no particular experience.

Hatching Chicks With Incubators

(Continued from prge 319)

made to sit. That is all common knowledge.

I believe the farmer is lacking in confidence. That's all. Confidence that he'll get what he pays for. Yet it is certain that he will get exactly what he pays for—no more, no less. Manufacturers' profits are not big these days. There's not much money in making incubators and brooders; and if the farmer and his wife exercise their judgement in buying; (and not expect to make "a silk purse out of a sow's ear") they will certainly be successful in the purchase and use of down-to-date equipment for hatching.

That is the way to secure the bulk of the profits from poultry on the farm,

ROBT. H. ESSEX,
Buffalo, N. Y.

DINNER BELL MUSIC.

The music of the dinner-bell is always welcome to the healthy man or woman—alike to the working man or woman who eats a plain meal at noonday, or to people of easier lives who enjoy a rich dinner in the evening. But to the Dyspeptic there is no music in the dinner-bell—it calls him to a trial for which he knows he is unfit. No one can enjoy a meal, or get nourishment and strength from it, knowing that pain and distress will follow after. The true course, even for healthy people, is to help the digestive system, from time to time, with that excellent tonic medicine, Mother Siegel's Syrup.

Mr. Michael Bureau, of Stanham, Quebec County, P.Q., writes: "For some time I suffered from Indigestion. I had headaches which made life a misery. I could not sleep at night and after eating I felt a sensation of fulness and pains, with heart palpitation. I took no medicine for this illness except Mother Seigel's Syrup and was cured when I had used one bottle of it."

PILES CURED at HOME by New Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Put Any Weight on a Maritime Fence

and it stands the test. Man or beast can't break it down. Maritime Fence never sags or gets out of shape. Made from extra heavy imported hard drawn steel wire, thicker, stronger and galvanized so it is peel-proof. It is the last word in strength and durability.

The staying quality of Maritime fence is in the simple lock with the bull dog grip. It never lets go—never lets the fence get crooked. Maritime Fence is always sightly; always straight—always best. The quality of material and construction makes it best.

Don't buy fence until we have put our catalog and price list into your hands, postpaid, by mail. Costs you nothing to find out all you want to know about wire fence. Get your pen now and write on a postal "Send the catalog." 9

MARITIME WIRE FENCE

New Brunswick Wire Fence Co., Limited
Moncton - New Brunswick

The N. B. Farmers' and Dairymen's Convention

(Continued from last issue.)

Be it further resolved:—that in the opinion of this meeting, this can most speedily be accomplished by the owner keeping a strict account of each and every individual producer weeding out the low production animal, and breeding only from the higher producers.

* * *

Be it further resolved:—That inasmuch as this method must necessarily add more expense to the already overburdened industry, until such time as the result of such line of breeding may have accomplished the desired result.

* * *

Be it further resolved tThat the local Government of the day be petitioned to grant such a bonus, based on the individual production, as may help defray the extra expense of this proposed idea, while it is being carried out.

* * *

Be it further resolved that a committee be appointed from this Association to interview the Government with the idea of maintaining one inspector for each county as a trial for one year, and if the found productive of good results, the idea be put in force, and that

EWING'S Seeds Pay

Even if someone offered them free it wouldn't pay you to sow seeds of poor or doubtful quality.

Your crop should be worth 10 to 100 times the cost of the seed. Inferior seed will easily lose you half the crop, or from 5 to 50 times the cost of reliable seed.

Economizing on seeds is most expensive economy.

If you sow Ewing's seeds and the weather is anyway reasonable, and you give them a fair chance in the way of soil and tillage, you can depend on FULL CROPS of A1 quality — crops that will pay handsomely for the land used and the work done as well as for the small investment in the seeds themselves.

Ewing's Seeds have proved their reliability by forty years of bumper crops.

Insist on Ewing's. If your dealer hasn't them buy direct from us.

Our big Illustrated Catalogue is Free—write for it to-day.

4 **Wm. Ewing & Co., Seedsmen, McGill St., Montreal.**

Make Them Sound

A lame horse is a dead loss. Spavin, Curb, Splint, Ringbone, Swollen Joints and Bony Growths won't cure themselves. Yet you can cure these troubles and make your lame horse sound with

Kendall's Spavin Cure

just as thousands have done, and are doing today.

In the 40 years that this world's famous remedy has been on the market, Kendall's Spavin Cure has saved millions of dollars to horse owners.

Mounds, P.O., Olds, Alta.

"I have used Kendall's Spavin Cure for a number of years with great success, and I think it can't be beaten as an all-around stable liniment for Kicks, Strains, Swelling of all kinds, Ringbone and Spavin".

THE ROMATIC STORY OF A CANADIAN ENTERPRISE WHICH NOW ENCIRCLES THE GLOBE.—Long before the Canadian Pacific stretched its line of steel across the continent—while the Indian and the buffalo disputed the possession of the Prairie Provinces—while steamboats were still a novelty, and electricity almost unknown—there was established in a very modest way, in a little town of the St. Lawrence, an enterprise which has since girdled the earth.

It was not heralded in the public press or cried from the housetops, for it was not the manner of those times to take full pages in the newspapers or stretch great signs across the landscape. Yet the product of this enterprise was knows and appreciated by almost everybody in the Canada of fifty years ago. Our grandfathers looked upon the founder of this enterprise as a public benefactor, and always gave a place in their homes to the fruits of his judgement and perspicacity

The story of this discovery is the story of a most unusual search for knowledge, and its equally unusual reward.

Nearly one hundred years ago Josiah Morse graduated from one of the best medical colleges in the United States. He had heard a great deal about a remedy devised by some wandering Indian tribes, which they were said to be using with remarkable success in curing most of their common ailments. Though somewhat sceptical about it, he decided, before taking up a regular practice, to visit the Indians and investigate, probably in the hope of adventure as well as of getting some valuable information

He found a race of Indians very different from their degenerate descendants, who now hang around white settlements. Lithe and active, with keen and intelligent, if uneducated minds, they lived close to Nature, and drew from her strength and wisdom.

Dr. Morse soon discovered that the reports of their remedy had not been exaggerated—but he did not so quickly discover the secret of its ingredients or of the method of compounding them It took him many moons to gain the complete confidence of the Indians and to overcome their inbred reticence and love of secrecy. But finally, after he had lived among them for two or three years, as an Indian, they revealed the whole secret to him.

Returning to civilization. Dr. Morse took up regular practice, using wherever it applied, this Indian specific, which he prepared himself from roots and herbs. At first he used it in liquid forms, but afterwards, for convenience, he reduced it to pills, which soon became known well and favorably throughout that part of the country as "Dr. Morse's Indian Root Pills."

When he retired from practice Dr Morse sold the secret to Comstock Brothers, of New York City, and in 1857 W. H. Comstock, the present proprietor, became sole owner of the formula.

He established laboratories in Brockville, Ont., and at Morristown, N. Y., to supply Canada and the United States. He prepared the pills himself and then, with horse and wagon, he covered the Canada of that time from Montreal to Sarnia, and the Maritime Provinces as well, placing the pills in practically every cross-roads store.

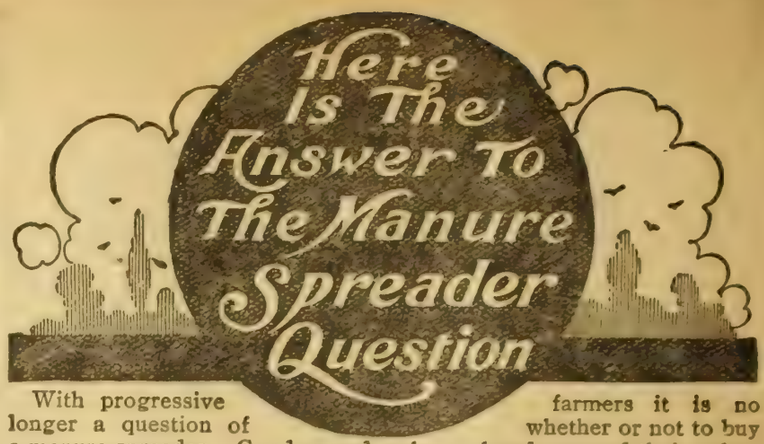
The half century that has elapsed since has witnessed an enormous growth in the enterprise thus modestly launched. To-day Dr Morse's Indian Root Pills are on sale, not only throughout Canada and the United States, but the world over From the laboratories at Brockville Can —Morristown U S A.—Sydney, Australia—Wellington New Zealand—and from the branch in England, they go to seaports throughout the world. From seaport and railway station the burros in Mexico and South America, the llamas in Peru, Ecuador, Thibet and Northern China the camels in Asia Egypt and Western Australia, the bullock waggons in South Africa and the sampans on the rivers of China, carry them to the uttermost parts of the earth.

To guard the absolute purity of Dr Morse's Indian Root Pills every ingredient is prepared in the Comstock laboratories. The different roots and herbs are brought there in the crude state, ground, prepared and compounded under the personal supervision of the Comstock chemists. Nothing is prepared outside but the wrappers and boxes, so that there can be no question of the purity of Dr. Morse's Indian Root Pills This cannot be said of half a dozen proprietary remedies in America.

The Pure Food Laws of Canada Australia and the United States, wisely adopted for the protection of the public, did not necessitate a single change in any ingredient or in the formula of Dr. Morse's Indian Root Pills As a matter of fact, though thorough tests have been made every few years, by chemists and physicians, to see if the formula could be improved, it stands to-day exactly the same as when Dr. Morse brought it from the Indian encampments nearly a century ago The price, originally two York Shillings (25c), is still the same, for though the cost of the crude drugs has advanced a great deal, improvements in laboratory methods have cut down the expense of making sufficiently to compensate for this

To-day W. H. Comstock, the man who introduced Dr. Morse's Indian Root Pills in young Canada fifty years ago, alert and active, though well past the allotted "three score and ten," sits at his desk in the Head Office at Brockville, keeps his fingers on the pulse of his world-wide organization, and has as keen a personal interest in the testimonials received from the ends of the earth as when, in the old days, he got an occasional letter from some one who had been helped by Dr. Morse's Indian Root Pills.

Your old Carpets will make you handsome Rugs. Write for booklet mailed free.—THE MARITIME RUG WORKS, St. John, N. B



With progressive farmers it is no longer a question of whether or not to buy a manure spreader. Good spreaders have already proved their value. The real question is—which one will net you the most profit?

The I H C line answers that question. Among the many styles and sizes, you will find one that just meets your needs.

I H C Manure Spreaders

embody all that is best in manure spreader construction—all that makes for greatest manure profits. They have strength in abundance to withstand the hardest usage; they are simple, sure and steady in operation; they work perfectly with fertilizer in any condition; they are exceedingly light in draft.

I H C manure spreaders are made in three styles; each style is made in three sizes, ranging from 30 to 70 bushels capacity. Corn King spreaders are of the return apron type; Cloverleaf manure spreaders have endless aprons. Two styles of feed are furnished—either ratchet or double pawl worm gear. There is an I H C to suit each requirement—large sizes for large operations, medium sizes for the average farmer, small sizes for orchards, vineyards—for every condition. I H C spreaders have lime hoods to spread commercial fertilizers; drilling attachments to distribute manure in rows. Whatever I H C spreader you buy will pulverize and spread manure or commercial fertilizer perfectly. You will find it durable, and it will net you big dividends on your investment.

Manure is the cheapest and best fertilizer but it must be handled and spread right or most of its value is wasted. You must have an I H C manure spreader to get 100 per cent value out of the manure. I H C spreaders are doubling the crops of others. The one that suits your needs will do it for you.

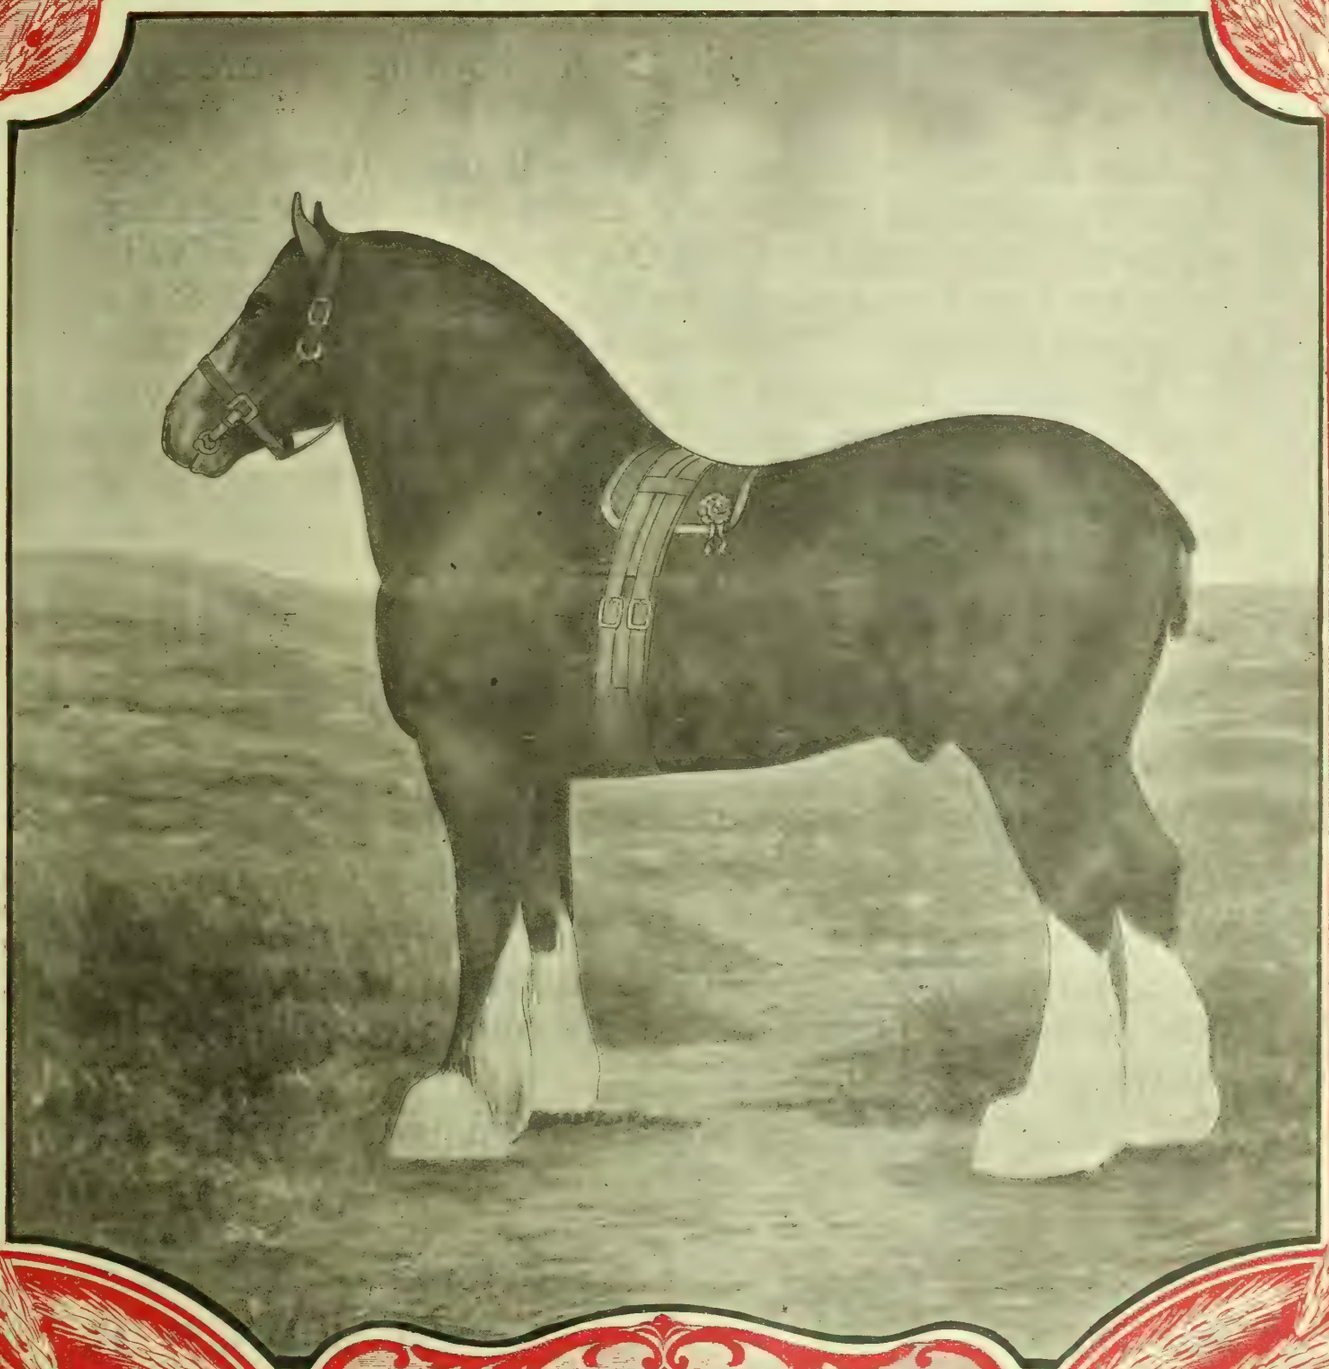
THE MARITIME FARMER AND CO-OPERATIVE DAIRYMAN



SPRING 1910

FREE

A Pair of Horse Clippers

If you can buy the same make or quality of Clippers for less than $2.00 at your dealers, we will refund you your money.

The Maritime Farmer will tell you that we will stand behind our guarantee.

To introduce our Gall Cure to the farmer, we make the following offer:

If any person will agree to sell one dozen of our Gall Cure at 25c. per box to men in their locality, we will, on receipt of $2.00, send the pair of Clippers and one dozen of the 25c. boxes of Gall Cure, charges prepaid. You cannot buy the Gall Cure for less than 25c. per box at your dealers and you will never get it again at a reduced price. We are only doing this to introduce it; in future your merchant will supply it.

What the Gall Cure Will Do.

It will cure any sores under the harness.

It will cure scratches.

It will cure any sore or cut on a horse.

No better healing ointment made.

This Gall Cure was used by Dr. Pendleton, the man that first made Pendleton's Panacea and who was one of the greatest owners of horses in America in his day.

We bought this formula when we purchased Panacea.

Preparation of Soil and Grain for Seeding.

By L .S. Klinck, Macdonald College.

THE time to begin the preparation of soil for seeding is the preceding summer; the time for preparing the seed is during the winter months. If the land intended for this season's small grain crop has not already been well plowed it cannot be properly prepared for the crop of 1910; if suitable seed has not yet been obtained there is still time to do so although the eleventh hour is upon us.

The fact that the available area of land in the Maritime Provinces, well adapted to the profitable growing of small grains, is comparatively restricted in comparison with the immense areas in Manitoba, Saskatchewan and Alberta, and that the productive capacity of our soils is more rapidly depleted than theirs, makes it all the more imperative that our fields intended for small grains be more carefully prepared and that the seed sown be given the closest attention.

With but few exceptions early fall plowing, for our staple crops, has proved to be better practice than spring plowing. Fall plowing prevents the seeding of weeds, holds insects in check, equalizes farm labor, makes conditions more favorable for the absorption and retention of rainfall and snowfall, increases the pulverizing action of frost and enables the land to be seeded much earlier in the spring.

A moment's reflection will show the practical bearing each of these factors has on the production of good crops. As a concrete example of the influence of one of these factors, allow me to give the results obtained at Ste Anne in an experiment on time of seeding. The and was uniformly fertile, fall plowed and all conditions were the same except the time of seeding. In conducting the experiment, six seedings were made of each class of grain (wheat, barley, oats, peas, emmer and spelt) and as the seedings were one week apart the sixth seeding was made five weeks after the first. The results of three years work are striking and suggestive. They show that spring wheat, seeded as early as the ground could be worked without injuring its physical condition, averaged 35.55 bushels per acre while that seeded five weeks later averaged only 15.52 bushels per acre—a decrease of a little over twenty bushels per acre due wholly to the time of seeding. The falling off in quality was likewise very apparent. The other grains showed the same tendency although not so pronounced—oats showing a decrease of 11-21 bushels and barley 4.1 bushels per acre. These experiments have demonstrated thatunder our conditions all small grains, with the exception of field peas, should be seeded in the spring as soon as the ground can be worked to advantage. This early working is possible only when fall plowing is practiced.

All classes of grains except barley and peas showed a gradual decrease in yield as the time of seeding was delayed. To illustrate:—The first seeding of wheat gave an average of 35.55 bushels, the second 26.97 bushels, the third 26.10 bushels, the fourth 23.05 bushels, the fifth 15.90 bushels and the sixth 15 52 bushels per acre—a strong argument in favor of early seeding and also directly of fall plowing.

A word as to the preparation of seed. It should scarcely be necessary to say that the procuring of the best class, variety and strain for our local conditions is fundamental; and yet so long as large quantities of western feed grain is used for seed, just so long will there be occasion for emphasizing the superior value of acclimated seed or of obtaining new seed through reliable seedmen. The frequent low percent of germination, coupled with the noxious weed seeds it so often contains, to say nothing of the grower's lack of knowledge as to the producing power of the variety, should debar any feed grain from being used as seed.

Screen and fan all seed grain thoroughly and reserve only the plumpest and best developed grains for seed. If necessary, run the grain through the mill two or three times. The light seed and the small seed will be just as valuable for feed as before, and, in addition, practically all the weed seeds will be removed.

Having, then, secured the best grade of seed possible, a germination test should be made even when the grain is of our own growing. Late or wet harvests frequently seriously reduce the percent of germination in oats and so weaken the vigor of the resulting plants. An accurate knowledge of the percent of strong vital seeds will enable us more intelligently to estimate the correct quantity to sow.

In testing seeds most farmers prefer a germination box filled either with sand or with a light loamy soil which will not readily puddle or bake. A box 1′x1′x3″, inside measurement, will hold 100 seeds planted 1″ apart each way and still leave ample margin around the outside. The easiest way to mark off the ground for planting is to make a lid the size of the box and mark it off into squares 1″ each way. At the points of intersection drive small nails. In the depressions made by these nails, when the lid is placed on the box, place the seeds. The ordinary cereals should be planted about 1′ deep. Keep watered and keep in the living room at ordinary temperature.

In case earth cannot be procured, take an ordinary dinner plate, and after saturating several thicknesses of blotting paper, place these on the plate. Then count out 100 or 200 average grains. Place these on the wet paper, cover them with several thicknesses of wet blotting paper and invert a second plate over the whole. Keep the paper moist, but not wet, and place the dish in a room having a temperature of about 70 degrees. As soon as the grain sends out both root and stem remove them and make a record, not only of the number that germinate, but also note the vigor of growth from the different seeds.

When oats have come from a field infected with smut the seed should be treated with formalin. One pint to 40 gallons of water will give best results. Spread the oats out on the barn floor in a thin layer; have one man shovel the grain over while another sprinkles the solution on with a watering can until all the grains have been moistened. Then shovel the grain into a pile against the side of the barn and cover it with old blankets or bags so as to prevent the gas from escaping too rapidly. Leave the oats covered over night and in the morning spread them out in a thin lawer to dry before seeding.

A GOOD INVESTMENT.

Bear River, Nova Scotia, April 2, 1910.

Publishers the MARITIME FARMER,
Sussex, N. B.

GENTLEMEN:—

I have your valued favor of 1st with bill, which I am returning herewith enclosing also $1.00 covering my subscription to April, 1911. During the past twelve months it has been a pleasure always to receive the MARITIME FARMER, each issue being worth more than the charge you make for the entire year The excellence of your reading matter should, we believe, commend it to everyone engaged in agricultural pursuits in the Maritime Province, and we know of no investment which should yield better returns than the time spent in a careful perusal of the excellent articles appearing in your journal.

With best wishes for continued success, I am,

Yours very truly,

W. G. CLARKE.

Interesting Maritime Boys in Farm Life at Home.

By Rev. P. C. Gauthier, D.D., Palmer Road, P. E. I.

Rev. P. C. Gauthier, D. D.

Editor Maritime Farmer:—

As the time approaches for the husbandman to cast the seed once again into the furrow, his thoughts naturally turn to the farm and its possibilities. There are many problems which have been and are still agitating the minds of our farmers in these Provinces by the sea and one of these is how are we going to keep our boys on the farm? The solution of this problem, on account of its paramount importance, and its far-reaching results is certainly worthy of the serious and undivided attention of all right thinking men, all who have at heart the prosperity and advancement of this fair portion of Canada. We can never hope to make farmers of all our boys, nor is it desirable that we should endeavor to do so, for many of them are naturally inclined and fitted for other professions or callings, but a goodly number leave the farm and fail in their chosen professions, who would have been successful farmers had they been taught at an early age to appreciate at its just value the nobility of agriculture. However, the enthusiast is abroad and thanks to him, agriculture is becoming, with many of our people, a labor of love rather than one of necessity.

Our educationists have been accused and justly too, of educating our boys and girls off the farms. The ideals placed before our boys in our schools and colleges by their teachers have been men who have attained the utmost rung of the ladder in the so-called liberal professions, great and good men, we admit, men whom we honor but too often these educators of youth have forgotten that the most noble, the most honorable, the very basic profession upon which all other professions depend is agriculture, and the real nation builders, the successful farmers have been flippantly passed over as not worthy of the attention or eulogy of these would be educators. The farmers themselves have been somewhat to blame for they have too often lost sight of the fact that home education is calculated in a great measure to form the child's aspirations for the future. Many a father and mother have to blame themselves today if, in their declining years, they are left alone on the old homestead which must eventually pass into the hands of strangers. Had they been less pessimistic and had made farming less a drudgery for their children their sunset of life would have been made radiant and bright by the presence of youthful lives round about them. Boys and girls must become interested in their work if parents want them to work cheerfully and well. Farmers give your sons and daughters an interest in some side lines of farming, such as poultry raising, dairying, or a few acres to cultivate. I know a farmer, a successful one too, who rents to each of his boys aged respectively fifteen and sixteen, five or six acres of land which they till under his supervision and guidance. They buy the seed from the father and sell him the grain when harvested at the highest market price and after having paid rent and fertilizer they add the balance to their bank account. So interested have these boys become that instead of having to spur them on in their work the father was to moderate their ardor. Let every farmer who has boys try this method and note results. Farmers give your boys and girls a good time. Allow them an occasional holiday during the summer months; take them with you to fairs and exhibitions and they will be less apt to envy the lot of our provincialists abroad who come to us to spend the summer and eat the fatted calf.

The school, the home, public sentiment are all factors in the education of the child and these all can do much to bend the young mind towards agricultural pursuits. The farmer of today, however, to win in the race, needs a higher agricultural education than the home or the common school can supply. No man can succeed in any profession unless he loves his work and the greater the knowledge of that work the greater also the appreciation and love of it.

At a meeting of farmers a few days ago one of the speakers said, and he seemed to know what he was talking about, that ten dollars invested in

MEETING OF THE WATERS, MATAPEDIA AND RESTIGOUCHE, WITH RESTIGOUCHE ("MILLIONAIRES") CLUB HOUSE IN FOREGROUND.

agricultural education paid better than one hundred invested in land. Men who have had the advantage of quiring a good agricultural education will certainly vouch for the truth of this statement. We see farmers ready to pay hundreds of dollars to educate their sons that they may become lawyers or doctors. They even think nothing of mortgaging the old homestead to this end. Yet these same farmers cannot afford a single penny to give an agricultural education to the boy or boys who stay at home. If we want to keep our boys on the farm nothing must be spared to give them the highest appreciation of their profession and this can be attained only by the best education this country can afford. We have in our midst an Agricultural College which is destined to revolutionize our conditions and that for the better if we know how to appreciate and encourage it as we ought. The great majority of our farmers can well afford to send one or two of their boys to this college during the winter for two or three months. The knowledge acquired, and as a consequence the new zest and enthusiasm manifested by these boys in their work on the farm would in one year more than compensate the father for the money invested. The farmers in these provinces must be up and doing if they wish to keep pace with the other parts of Canada. Agricultural education holds an honored place in all the other provinces. The Great West Ontario, Quebec, are showing themselves alive to the importance of such an education. Our legislators in these Eastern Provinces are also realizing that our national prosperity nay our very national life depends on our farmers and are doing much to encourage and educate them. Let the farmers themselves therefore appreciate their opportunities and thake the advantage of the helpful education which, experimental stations, Farmers' Institutes, and our Interprovincial Agricultural College at Truro, are calculated to bestow.

Let us ever remember that our fathers have left us a goodly heritage, a heritage which they claimed from the wilderness at the price of many sacrifices, great toils and labors and that we are in duty bound by the law of solidarity and by the love we bear to this glorious patrimony, to hand it over to our children not with the mark of deterioration upon it but richer and more valuable than we found it and that we must teach our children to pass it over to their children with the fruits of their best endeavours stamped upon it.

Can New Brunswick Farms be Successfully Operated Without Live Stock?

BLISS M. FAWCETT.

The subject, "Can New Brunswick Farms be Worked Successfully Without Live Stock," is one that I will need to discuss very carefully considering that our worthy President is to follow on commercial fertilizers.

Would it be possible for a watch to go without wheels?

If Edison had not been born would Dreadaughts be the topic of to-day?

If the wizard Marconi had not come out of Spain, what of the messages, that are now thrown through the heavens, to our corner of Christendon.

Someone has said, "without live stock agriculture is a failure."

Who ever made a good captain without first learning how to splice a rope?

Who can realize the beauties of nature without having spent many days, watching the development from early spring till the leaves fade in in the autumn.

Tell us a living person who has seen a well worked farm without having live stock as the basis of its productiveness.

This is an age of experiments. Old ideas are discarded for the new. Men everywhere are looking for an easy job, or one that requires a high collar, a white vest and six hours out of the twenty-four. This searching out for invention has reached the boys and girls on the farm. "I am going to college and after that become rich in the city," says the host of them. "Never will I tend chickens, feed pigs, train colts or plow. Not for me to sit under a cow and smell of the barn. No! I am created for the noble city, some day to be Mayor, or Bishop or Governor General."

The President looks at me and wonders, what has all this to do with the subject "Can New Brunswick Farms be Kept up Without Live Stock?" Listen: These very things happening every day, are the chief causes of the dimishing of live stock of all kinds.

Can we run our farms without the boys? Can we be satisfied to stay at home, while all the refined, intelligent and smiling maidens go to the cities? The conundrum goes, If all the girls go to China, where will the boys go? To Peek-in, Pekin. This is where we find ourselves, at this critical time in New Brunswick agriculture. The few who are left on the farms cannot possibly keep up the herds of cows, sheep, horses, poultry, pork raising and all the other important features so necessary in agricultural life. Evidences of this are seen on every hand, as we go here and there throughout every county in the province.

Mr. Wetmore will follow me this evening and give grand accounts of the several stimulating commercial fertilizers. Certainly they will make a garden plot to "Blossom as the rose" and the yields of several acres, in almost any case, to be enormous. But, gentlemen this is not agriculture. I can take you to thousands of large farms in this province, that have dropped out of live stock,where ox eyed daisies, and weeds of all descriptions can be seen as far as the eye can reach. Why? Simply because everything has been taken out of the soil and nothing has been replaced.

Did you ever roam around a farm of one or two hundred acres with a large herd of cows pasturing? Did you ever see the farmer and his sons milking those well fed animals? Watch the heavy loads of milk going to the factory. The broad-backed steers going to market at 10c. a pound. Heavy draft horses, sometimes trotters, too, going to the city at big prices. Can you find weeds and small returns from that man's establishment. Follow him to the Bank and you will find a deposit. Go to the church and he will be building the steeple. Follow him over his domain and you will behold a picture of well cared for live stock and growing crops, the beauty of which cannot be surpassed this side of the "Pearly Gates."

Live stock surely is the only keynote to New Brunswick prosperity. With them is the entire bread of life. With them is kept up the fertility of the soil. With barnyard manure which beats everything to grow the tender blades. The table is ladened with delicious viands of every description, luxuries in fruit without number, in fact everything that mortal man would care, is held out in those two words "Live Stock."

Depend on commercial fertilizers, and what have you? Put your hand deep in the leather bag and pay $40.00 a ton for your potash. 'Tis true a good yield will be the outcome on a very small area. But my! No stock to eat anything. No cows for the boys to get, no chores to do. After the harvest, lie dormant through the chilly days and months of the winter. What a picture!

Politicians, Doctors, Lawyers, Preachers, Statesmen, everybody when addressing an agricultural gathering will say. "The farm with its green pastures, the quiet country life, its overflowing everything. You are the blessed of the earth." Not a living soul ever put that into practice and reared a farmer.

The Government of New Brunswick is up against the hardest problem in the history of the province. Smile, as you may, we farmers swing the multitude, or perhaps I should say, we can. Mostly always its live stock by the thousands. The several governments have bonused cheese and butter factories by the score. The doors of most of them are today closed. If we live in this country the very first thing we want is milk, butter and beef. For ten years, New Brunswick has been importing these things from Ontario and Quebec. 1909 was the largest importation of all, amounting to thousands of dollars.

In many sections of the back districts most excellent farms are for sale by the hundreds. Strong endeavor is being made to stop some of the coming immigrants and locate them here. They will move out very soon after they come,unless the present government places on their platform at once the policy, "that Live Stock is the only basis of successful agriculture."

The Laymen's Missionary movement, is endeavoring to christianize the world in 25 years. Along with that let this Government take up the the political lawyer swings us. This province in 20 years has decreased Live Stock question and urge into the highways and byways of the province. Send out men and instruct the new comer how to make a dollar. Not much use to preach religion to him, if he is as poor as a Russian Surf. Help his pocket by showing him how to raise Live Stock of all kinds. This certainly is the only means of holding those who, are here and retaining those who come.

In that day when the hardy son of form and I say it now, that we should hang down our heads when we think of so much beef, poultry, flour, farm machinery and thousands of tons of milk feed that keep pouring in from the West when Live Stock raising would stop it all.

We should condemn ourselves, too, that the Legislature yonder, is not half from the farm. I say, if that was so, these things would be changed and that very suddenly. It is not their fault it is ours. I say also, that it would be a wise policy for this Government to pass a resolution asking that in every constituency one farmer be sent to Parliament. Then, and not till then, will we, who comprise four-fifths of the population get justice.

In the day when the hardy son of toil becomes supreme, Live Stock will be scattered over this beautiful New Brunswick. The vacant farms will be re-stocked. They will cease importing and be exporters. The population will increase, land will be more valuable, the revenue will increase and everybody in Christendom will listen to the Preacher. Up then my "brother man." Let Anglo Saxon justice be famed forth and as the Western gates are open inside to people from every clime, so let us assert our independence and let the East show to those who happen within our borders, that New Brunswick is shoulder to shoulder with any portion of this fair Canada.

Paper read by Bliss M. Fawcett, Sackville, N. B., before the New Brunswick Farmers Association'

Bacteria in Relation to Rural Life

Some Friends, Others Foes

By Prof. M. Cnmming, Truro, Nova Scotia

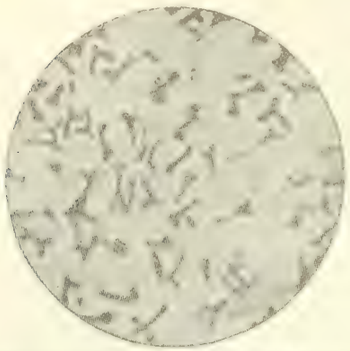

PLATE 1.—This shows bacteria from nodules on the Hairy Vetch, as they appear under the microscope which has magnified them 1500 times.

No forms of life are of more interest nor affects mankind to a greater extent than bacteria. These are minute living things lying on the border land between plants and animals. They float in the air we breathe and in the water and milk we drink; they exist in the food we eat, in the soil we till, in all animal and plant remains and even in our living bodies. They are so extremely small that they cannot be seen without the aid of powerful microscopes and, hence, although so omni-present, and so much written about and discussed, few realize the important functions they perform in nature.

Were I to inquire of my readers in regard to their notions about bacteria, I fancy that, from most, I would hear of bacteria as the cause of such dread diseases as typhoid, diphtheria and tuberculosis, and would hear very little of them as the benefactors of mankind. It is our purpose, in the course of this paper, to discuss bacteria, not alone as the cause of disease, but to a greater extent as the benefactors of mankind and especially of the farmer.

CHARACTER OF BACTERIA.

Bacteria stand on the lowest plane of life and are the smallest organisms that are known to exist. They differ greatly in size, but are of an average diameter of about one thirty thousandth of an inch, which is so minutely small that, if a hundred individual germs were place side by side, their total thickness would not equal that of a single sheet of paper upon which this page is printed. Unlike higher forms of life, which are composed of many cells grouped together, each bacterium consists of a single cell, but these cells vary in shape. Bacteria are classified into three main groupes in accordance with their variation in shape. These are:—(1) The spherical or coccus form. (2.) The rod shaped or bacillus form and (3) the spiral or cork-screw or spirillum form.

THE FOOD SUPPLY OF BACTERIA

The majority of bacteria live upon dead inert organic matter, such as meats, milk and vegetable material. A smaller group among which are the disease producing germs, derive their nourishment from the living tissues of animals or plants.

MOVEMENT OF BACTERIA.

Many bacteria are unable to move by means of their own organs from through the soil, the air or any place to place. These are diffused other body by means of currents of water, the wind and by being carried in various ways. There are classes of bacteria which are endowed with powers of locomotion These move by means of fine, hair-like outgrowths developed on the outer surface of their cells.

RATE OF GROWTH.

Under normal conditions, bacteria multiply rapidly. The rate varies with the food supply and the temperature. Some species flourish when the temperature is near freezing point and other flourish when the temperature is considerably above blood heat. The optimum point for the greater number is a little below blood heat. To give some idea of the rapidity of growth, we may state that if a single bacterium were to be placed in milk at a temperature of about 90 degrees F. it would divide and become two in about 20 to 30 minutes, and these two would become four in another 20 to 30 minutes. At this rate, it is estimated that if favorable conditions could be sustained, there would be produced in 24 hours as the off-spring of a single bacterium some 17,000,000 descendants. However, under a state of nature, this enormous rate of increase is not attained, for as the bacteria multiply, they produce acids and other matter which is unfavorable to their growth and so retard the rapidity of their development. Nevertheless, under reasonably favorable conditions, bacteria multiply at an enormous rate.

PLATE 2.—This shows roots of a common Red Clover plant with the nodules, in which the bacteria live, natural size.

HISTORY.

Bacteria were first beheld by Leeuwenhoek in 1675. However, it was not until 1876 that, as a result of the studies of such well known men as Dr. Koch and Pasteur that any-

A GOOD FOUR HORSE TEAM

thing of a definite character come to be known about these forms of life. The science of bacteriology may, therefore, be said to be little more than one-third of a century old and when we consider the immense amount of information and application there-from, which have been derived in this short period, we cannot but wonder what will be the outcome when the mind of man has been applied to this study for as many years as to the study of other subjects.

BACTERIA THE CAUSE OF DISEASE.

The earlier studies of bacteria were largely confined to a study of these organisms as the cause of disease. In 1876 Dr. Koch demonstrated that anthrax was caused by bacteria and since that time it has been ascertained that typhoid, tuberculosis, diphtheria, pneumonia, scarlet fever, lock jaw, etc., and various intestinal troubles are caused by these organisms. Prior to the discovery that such diseases as the foregoing were caused by bacteria, methods of treatment and sanitation were much less effective than those methods which are now practiced, for with a knowledge that bacteria caused such diseases, bacteriologists and doctors have devoted their attention to controlling the action of the bacteria and thus preventing the development of such diseases. For example: Following the discovery that diphtheria is caused by bacteria, bacteriologists developed an anti-toxin, which causes the activity of diphtheria bacteria to cease. The following figures, quoted from the Metropolitan Hospital, of London, England, indicate how successful this treatment has been in comparison with former methods. During the years 1890 to 1903, before antitoxin was used, out of 7101 cases of diphtheria treated, there were 2161 deaths, i. e., 30.39 per cent; whereas, in the year 1903, when antitoxin was used, out of 4839 cases, there were only 493 deaths, i. e., 10.1 per cent. Moreover, in those cases where antitoxin was administered on the first day of the disease, there were practically no deaths. Similar instances, such for example, as the pasteur treatment which is now used to prevent the development of rabies in people who have been bitten by mad dogs, might be multiplied, but we have shown sufficient to indicate the great value of the study of bacteriology to mankind.

BACTERIA AND THE WATER SUPPLY.

All surface waters contain bacteria, which may vary in numbers from a very few to many millions per glass of water. These bacteria come from the soil over which or through which the water may run, from sewage and from various other sources. The number of bacteria in water is not exactly as would be expected in accordance with our ideas of pure water. The water in the running brook is generally thought to be purer than that of the stagnant pond. Generally, however, the opposite is the case. The reason for this is evident. Brooks form the drainage system of country and into them is washed the surface drainage of the land, which is rich in bacterial life. In the pond or lake some of these bacteria die and the majority settle to the bottom, so that pond water is generally safer to drink than the water of running brooks, be it ever so clear and bright.

SEWAGE CONTAMINATION OF EATER.

In determining the purity of drinking water, it is not so much the number of bacteria as the kind that is of importance. A stream, for example, which flows through an uninhabited section of the country

A GOOD HATCH

may carry many bacteria with it, but such bacteria may be perfectly harmless, but a stream which flows through an inhabited section of country may be polluted by the sewage of that country and may, from this source, derive bacteria of the most deadly character. There is, therefore, no more important subject to be considered in dealing with the health of urban or rural communities than to make sure that the water supply is free from sewage contamination and so, free from bacteria that may cause disease. The present out breaks of typhoid in Montreal and Toronto are generally considered to be due to sewage contamnation from some source or other in the water which the citizens have to consume.

In the country, the greatest danger attaches to wells. All surface wells are more or less dangerous. The greatest danger exists when the surface of the well is lower than the surrounding land, so that when a freshet occurs, surface water can run in. Provided, however, that the masonry of the well is so constructed as to prevent surface drainage and that the ground slopes away on all sides, danger from this source may be reduced to a minimum. There is still, however, great danger especially in open and gravelly soils that sewage may drain down through the soil and that the germs contained may gain access at the bottom of the well. The deeper the well the less danger from this source. In fact, if the well is sufficiently deep, its masonery sufficiently tight to prevent water from getting in at any other source than the bottom and the top so constructed that surface drainage is impossible, danger may be reduced to a minimum. Above all things, one should see that the well is a sufficient distance from the house and out buildings to prevent any possibility of human contamination. By all odds the safest well is the bored or artesian well.

BACTERIA THE SCAVENGERS OF NATURE.

Have you ever wondered what would happen if with the death of animals and plants no decomposition were to occur? Or have you ever wondered at how quickly, under the processes of nature these things are removed from sight? Bacteria are the agencies which attack these complex animal and plant remains and resolve them into their simpler forms, in which they can again be made use of by succeeding plant and animal life. A mighty forest tree has fallen to the ground and lies there an obstacle in the way. As the years go by, minute bacteria attack it and gradually cause it to crumble and finally disappear from sight. These bacteria work in droves of millions and millions. Each one does a very small portion, but unitedly, as scavangers of nature, they make this world a habitable place, whereas, without their presence there would be such an accumulation of vegetable and animal remains that the world would become an impossible place in which to live. In the year 1818, John Young, then known as Agricola, who of course did not know the means by which this decomposition was brought about, but who recognized the fact, wrote thus: "I know no indication of greater skill in the Divine Intelligence, nor a more indubitable mark of his care and goodness, than this contrivance of resolving all dead animal and vegetable matter into elementary principles; that, in the first place, he might relieve the earth of such loathsome incumbrances, and in the next place, be supplied with fresh materials out of which to form and sustain the new and successive families of plants." From this standpoint alone bacteria are infinitely more the benefactors than the enemies of mankind.

EXERCISINC THE BULL

BACTERIA IN THE SOIL.

The superficial layers of soil teem with bacteria, which may vary in numbers from scarcely more than a few thousand to six hundred million or even more per ounce of soil. In the lower areas the numbers become less and less, until four or five feet below the surface there are no bacteria. A knowledge of the presence of this teeming life in the soil has changed our conception of the soil from a mass of inanimate particles to a laboratory, in which millions of bacteria are constantly at work transforming highly complex and unavailable substances into simple substances suitable for the food of plants. In dry, sandy soils, poor in humus, the numbers of bacteria are low; whereas, in rich, loamy soils, containing a quantity of humus, their number is very large. In general,those soils are the most valuable in which bacteria are most numerous and vigorous. In any given soil the number of bacteria will vary with :—

1. — The temperature of the soil. This is controlled largely by drainage and cultivation.

2.—The moisture content of the soil. Dry soils are low in bacterial life. Moist (not wet) soils are rich in bacterial life. Drainage and cultivation are the principle means of controlling this.

3.—The amount of humus in the soil. The more humus the more bacteria. One of the great reasons why barnyard manure is a more satisfactory manure than any commercial fertilizer is because it adds humus to the soil and thus affords conditions for the development of that bacterial life. Besides, barnyard manure is very rich in bacteria and directly add these to the soil.

KINDS OF BACTERIA IN THE SOILS AND THEIR FUNCTIONS.

There are many species of bacteria in the soil. The function of the greater mass of them is to cause the decomposition of vegetable matter and so render this matter into simple forms available for plant food. Plants can make no use of fresh barnyard manure or of a freshly plowed grass or clover sod. The vegetable matter contained in these is in too complex a form to be used by them. The real role which bacteria play in the soil is in transforming this complex material into simple forms available for plant food. So important is this role that farming without the aid of bacteria would be an impossibility, for the plants would have no available food and the soil would yield no crops.

Some species of bacteria act upon the carbonaceous matter, (crude fibre, starch, etc.) of plants and break it down into such fine particles that it becomes an integral part of the soil. Some of this carbonaceous matter they resolve into the carbon dioxide of the air, which in turn becomes the food of another generation of plants; other parts of this carbonaceous matter they resolve into organic acids, which act upon the mineral elements of the soil,such as the phosphorous, potash, lime, magnesia, etc., and make these available for plant food. It is largely

OLD FRENCH FORTIFICATIONS AT ANNAPOLIS

through this formation of organic acids that bacteria cause such material as bone meal to decompose and yield up its plant food to the soils; for the plant food contained in ground bone is in an unavailable condition and must be transformed into simpler forms before it can be used by plants. Without bacteria this transformation would not take place and bone meal and similar fertilizers would produce no results. There are other species of bacteria which act upon the complex nitrogenous compounds and render them into simple nitrates, which can be used as food by plants. There are several different stages in this process of decomposition and each stage is effected by different species of bacteria. The process in the soil is the same as that which goes on in the manure heap. First ammonia is formed. This we readily detect whenever we enter the horse stable. Then a new class of bacteria change this ammonia into nitrous acid and still another class change this into nitric acid, which unites with the lime, magnesia, sodium and other bases in the soil or manure heap and in that form is used as the food of plants. This process goes on very quickly when the temperature is high and the air circulates freely, two conditions which must be prevented if manure in the barnyard is to be saved without under-going loss. In the soil, however, it is important to encourage this process, for in no other way can plant get the abunddance of food they require and, hence, if the best crops are to be produced in the soil, we recommend under drainage and frequent tillage, which are the principal means by which the temperature of the soil can be kept sufficiently high and air freely admitted.

BACTERIA WHICH ADD NITROGEN TO THE SOIL.

Thus far we have treated of those bacteria in the soil which transform, but do not add to the plant food of the soil. This class of bacteria may, in a measure, be compared to our manufacturers who do not produce material but who take the crude material supplied from some other source and manufacture it into forms suitable for the use of mankind. But there is another class of bacteria with which we will now deal that are constructive and add to the soil's content of plant food. Such are more comparable to the farmers who actually produce material, adding, by their operations, to the earth's supply necessary to the sustenance of man.

These are: 1.—The nodules or legume bacteria, which live in the nodules on the roots of clover, peas, and other plants of the legume family. From their method of living, together with other plaots, these are termed symbiotic bacteria (from the Greek, living together with). And 2.—The non-symbiotic bacteria (not living together with) nitrogen fixing bacteria which live in the soil independent of other plants.

LEGUME BACTERIA.

The public are pretty well informed in regard to the character of legume bacteria. These live, it is now known, in the nodules which abound on the roots of clover, peas, vetches and other plants of the legume family. These bacteria, unlike plants, can live upon the free nitrogen of the air and they give this up to those plants in whose roots they find lodgement. As a result, soils on which clover grows are found to be richer in nitrogen after the clover had completed its growth than at first. Experiments have shown as much as 25 to 150 pounds of nitrogen actually added to a soil in this way through the growing of clover, or peas or vetches; whereas, had such non-leguminous plants, as oats, or buckwheat, or potatoes been grown, there would be no increase in the nitrogen content of the soil. Now nitrogen is one of the essential elements of plant food and it is the most expensive. It costs from 15c. to 20c. per pound, in comparison with from 5c. to 7c. for a pound of phosphoric acid or potash, the other two most important elements of plant food. It would, therefore, seem that it would pay well for farmers to cultivate the acquaintanceship of such bacteria and in every way to encourage their growth.

Although these facts are now well known, yet it was only in 1886 that, through the studies of Hellreigel and others that their exact nature was understood. Away back in early Roman times, the soil-enriching qualities of legumes were known and commented upon by the leading Roman writers on agriculture. However, during the dark ages, agriculture, like all other cultures, declined and it remained to these latter times for a full appreciation to be arrived at of the importance of leguminous plants and the bacteria which live on their roots.

A knowledge of the soil enriching qualities of all leguminous crop lies at the basis of any system of crop rotation, or of soil improvement. Those farmers who are endeavoring at least expense to build up their farms, make a practice of growing clover or some other leguminous crop as frequently as they possibly can. Sometimes, especially by orchardists, the whole crop is plowed under and the soil thus enriched both in humus and nitrogen, but with clover especially, provided the hay is fed to stock and the manure turned to the land, it is more economical practice to cut the first crop for hay and then to plow under the aftermath. But even even when land is left down to hay for two or three years, or more, it will still be the better for having been seeded in the first instance largely with clover.

DIFFICULTIES ENCOUNTERED IN GROWING LEGUMES—HOW TO—OVERCOME.

Difficulties are often encountered by those who try to grow successful crops of clover. The soil may be too poor or it may be too acid; it may lack lime, or it may be in need of drainage. Oftimes, however, the reason why clover does not grow as luxuriously as it should is because the bacteria which are essential to the development of the nodules and hence to the appropriation of the nitrogen of the air are absent. This deficiency can be supplied by transporting soil from a field in which clover had previously flourished and on the roots of which nodules abounded to the new field. However, this process is not always convenient. Nor is it always necessary.

LOW TIDE AT PUGWASH, NOVA SCOTIA.

Bacteriologists now grow these bacteria in their laboratories and it is possible to send growths of these in small tubes to farmers in any part of the world. At the Agricultural College at Truro, Mr. E. S. Archibald is now growing on artificial food the bacteria from red clover, alfalfa clover, peas, beans, vetches, and he will send cultures of these with full directions as to how they may be used for a nominal payment of 25c. per culture. The method of inoculation is very simple. The applicant will receive a small bottle in which there will be some gelatinous material which provides food for the bacteria which are growing on its surface. The directions are to wash this superficial growth of bacteria off the gelatine by means of a little water and then to sprinkle this water, which will now contain the bacteria, over the seed. The seed is then allowed to dry for an hour or two in a dark place and is then sown in the ordinary way. In this way, each seed carries the bacteria which become attached to it to the soil. Nature does the rest. A fuller account of this process may be found in an article on Nitrocultures written by Mr. E. S. Archibald, which appears in the 1909 Report of the Secretary for Agriculture, Province of Nova Scotia.

DIFFERENT BACTERIA FOR DIFFERENT LEGUMES.

Although, the bacteria which live for example on the roots of red clover appear almost identical with those on the roots of alfalfa clover, or peas, or vetches, or beans, yet it is found that there is a difference. You cannot inoculate alfalfa clover with red clover culture, nor vice versa. A separate culture is required for each leguminous crop. As at first stated, it should be clearly understood that there are no nodules and no bacteria and no appropriation of free nitrogen in connection with oats, or potatoes, or any other plants, except those of the clover or legume family, as described in the foregoing.

RESULTS FROM SOIL INOCULATION.

For three years we have been sending from Nova Scotia Agricultural College cultures of legume bacteria with which to inoculate the various plants of the legume family. The reports to hand indicate that in about 60 per cent. of the cases, the crops have grown decidedly better as a result of this soil inoculation. In the remaining cases, the result of results have shown fair results to no results. A single quotation from a correspondent indicates results which he has achieved by the use of such culture: "Where I used nitro culture on red clover I never had a catch like it before. Where used, some clover came in bloom, and where not used the clover was small, immature and delicate. I believe that nitro culture is what we want in this part of the country; as a rule clover takes poorly." Those who wish to test the matter for themselves can secure the material by applying, as stated above, to Mr. E. S. Archibald, Agricultural College, Truro. In conclusion we may state that, where already the clover o peas etc., which it is thought to inoculate, grow well naturally, there the nodules will be found and no further advantage will accrue from an artificial inoculation, but wherever difficulty has been encountered in getthese plants to grow, unless perchance the soil is too wet or very poor or too acid, it will be well worth while trying soil inoculation.

NON-SYMBOTIC BACTERIA WHICH

PRIMITIVE MODE OF TRANSPORTATION.

ADD NITROGEN TO THE SOIL.

During the past few years there have been isolated from the soil, at least, six different species of bacteria living independent of other plants which are capable of making use of the free nitrogen of the air. It has also been determined that, in some soils, nitrogen has been added to an extent that could not be accounted for except by the activity of this class of organisms. Considerable experimental work has been carried on with a view to making cultures of these organisms similar to the legume bacteria cultures, but while some striking results have been attained, the general results have not been satisfactory. This, it is believed, is largely due to a lack of knowledge of the exact conditions necessary to encourage the growth of these bacteria. We look forward with some confidence to more discoveries along this line and judging from results already achieved, believe we have reason to expect much greater results in the very near future. In the meantime, we have no practical suggestions to offer in regard to the use of this class of organisms and our only excuse for introducing the subject at all is to give some insight into the problems with which soil Bacteriologists are now struggling.

We have thus briefly outlined the facts in regard to bacteria and their function in the soil. To fully explain even what is known would require too much space. But as yet the great field of soil bacteriology is but slightly explored and the facts which are known are only partially understood. Recent investigations, for example, have shown that the sterilizing of certain unfertile soils will decided,y increase their fertility. The explanation of this is yet obscure. It is generally, however, believed that this sterilizing causes the destruction of all classes of bacteria and that these are, by some selective process, replaced by favorable sorts that subsequently get a better opportunity for growth than they had when they struggled for existence side by side with unfavorable sorts. This explanation is somewhat speculative and we would not have introduced it, except that it serves to show some of the difficulties which soil bacteriologists are encountering and, further, serves to indicate what may be expected when a full solution is arrived at. When we consider that the subject of soil bacteriology dates back scarce 30 years, we cannot but wonder that so much has been ascertained. But when we contemplate how much has been achieved through the study of electricity, in a similar period we cannot but believe that a further application to the study of bacteria in relation to the soil will prove fruitful of practical results far beyond anything yet thought of.

We had intended in this article to deal with the subject of bacteria as related to the health of animals and the industry of dairying. But we have exhausted our space. Should this matter prove of interest to the readers of the Maritime Farmer, we will be glad in some future number to present this phase of bacteria in relation to agriculture.

Care and Protection of Farm Machinery.

W. R. D. Owings, Advertising Manager of International Harvester Company of America.

Since the arrival of dollar wheat, seventy-five cent corn and fifty cent oats, editors, college professors and economists have taken a great deal of pleasure in speaking of the present day farmer as a "business man." They do not always define the term and on close scrutiny it looks as if the so-called "business" farmer was sometimes such, largely because high prices of his products had made him prosperous, rather than because of his adoption of more businesslike methods.

It has been well demonstrated that a real business man is successful as a manufacturer in so far as he is able to make mechanical labor take the place of less productive hand labor, and that a real business man as a farmer is similarly successful in so far as he can do the same thing.

But here, very often, is where the resemblance ceases.

The manufacturer invests so much money in labor-saving machinery, he allows so much for depreciation and then proceeds to see that his machine is well housed, well cared for and kept going. He figures that it must pay so much interest on the original investment, plus a profit sufficiently large to equal, ultimately, the original investment. The longer the machine can fulfill the duties for which it was intended, the greater the money returns on the first outlay.

When a farmer figures on the same basis in caring for his equipment,the economic term of "business man" fits him and generally you can call him an automobile owner as well. But when he invests his capital in expensive machines—and many of them— such as modern farm nowadays necessitates, and then leave his plow in the fence corner and his binder in the field and his new wagon under the eaves of his cow shed, he falls short of exercising the right kind of business methods.

Perhaps he makes enough to be able to do all of this without noticing the drain upon his gross income. Some farmers figure that way but it is not good commercial doctrine.

The money which a farmer puts into a binder, mower or manure spreader, is just as much capital invested as the money another man puts into a machine for making shoes or spinning cotton. It deserves an annual interest and an ultimate profit equally as much, and it is entitled to as thorough care and protection. Furthermore, the laws governing continuity of service apply exactly the same to a cream harvester and a wagon as to a planer or grinder. Of course, owing to the seasonal use of farm machines, there are lapses of time when certain machines must remain idle. It is at this period when they should be best protected. Scientists say that the muscles of an arm wither quicker from inactivity than from over-activity. The same thing is true of equipment, whether on the farm or in the factory. More plows have been worn away by the weather than were ever worn away by service.

NEAR MARKET SQUARE, CHARLOTTETOWN, P. E. I.

True as this is, very little attention has been paid to the science of machine care. Experimental stations will work for years to show how to good many acres to pile up enough only thirty bushels grew before. No one questions the usefulness of this work, but it takes the difference of a gaod many acres to pile up enough dollars to buy a new binder. And yet, very little time is spent in showing how to increase the life of a binder from six to fifteen years. Perhaps they leave it to the common sense of the farmer. If they do, all right, for common sense is really the thing that is needed.

College instruction— ancestral advice— and orginal research in the care of farm machines can all be simmered down to these three elementary necessities—good roofs,good paint and good lubricants. These three determine whether the days of a machine shall be long in the land or whether it shall soon return to dust whence it came and another order go to the firm who made it.

Let every farmer attend to this trio. How and when are questions which each must answer for himself not very profound question but very important.

Few people realize how simple and yet how essential such care is and for those who have overlooked this phase of agricultural life, we give the experience of one successful Kentucky farmer which may contain helpful suggestions.

This man ran a big farm in that state and in spite of indifferent help and long used soil, made money. He was a firm believer in the above mentioned triumvirate and he practiced what he believed. Back of his barn he had erected a long low shed, not particularly showy or expensive, but dry, and under this shed he kept everything, in the equipment line—from grindstones to wagons. In one end he built a homemade improvised paint shop. Although his reputation as a family man in that country was good, it is said of him that he would just as soon leave a member of his family outside all winter as his mower or his drill.

Wnen he finished his plowing, he saw to it that his men brought the plow back to the shed. He then went over it thoroughly with a coat of white lead and it was left that way all winter. In the spring a little kerosene or turpentine was applied which loosened the paint so that with the first contact of the ground the share came out smooth and shiny like a mirror.

"That plow," said the Kentuckian, "cost me thirty-five dollars. The paint cost about thirty-five cents, and it made the plow last ten years longer. This is just an illustration" continued he. "of my procedure with every machine I own. Every two years I made it a point to go over all the binders, mowers, and all the other machines I had on the place, with a good metal base paint. I even painted the knives of the cutting machines the same as I did my plow, and I found that with a little application of turpentine or kerosene they became bright and shiny before the first circuit of the field was completed.

I didn't use up all of this paint because I felt more friendly towards the Sherwin-Williams people than I did toward the International Harvester Company. It was merely a matter of economy with me because paint was cheaper than new machines.

"Perhaps also the question of pride helped me a little, because I always liked to have everything about the farm clean and bright. I generally use red because I like that color and becaue red lead is better than white lead for outside work. kept even the tongues and whiffletrees of my wagons as good as new." They are mostly made of locust in that country and, when properly painted, would last a century.

"This painting was not just a hobby; I found that it paid, as at one time I sold a binder which I had used steadily for six years for over two-thirds of what it cost me and I didn't cheat the fellow either. It was practically as good as new.

"I was a paint advocate all right, and it seemed to me that hired men might come and hired men might go, but my wagons, mowers and drills went on forever.

"I was equally as 'cranky' on lubricants. When I first started farming as a young man, it did not take me long to find out that a hot box generally meant a ten mile trip to town for a new part. I had just about three experiences of this kind and after that the most important bit of barn furniture, next to the paint can, was the oil can. Many a time since then, when I have seen my neighbors tied up in the middle of a workday with an overheated part, I have praised 'John, from whom oil blessings flow,' as the University of Chicago boys say. I used to make it a rule, after each long trip, to grease my wagons with the result that they were always ready and always shipshape. I invented patent dust protectors of my own when none came with a machine and where this was not possible I kept the exposed parts well cleaned.

"Now, all of this might seem rather unimportant to some farmers, or they might think it a great deal of trouble for nothing, but, in the long run, I never noticed the trouble and I found that it was a good form of economy. I farmed for many years, at a time when prices were much lower than they are now, and I made my farm pay. I do not claim that it was all due to my caring for my equipment, but the fact that I made every cent of capital invested in the machines return me one hundred cents on the dollar, and then some, had a great deal to do with my prosperity."

Summer Care of the Sheep Flock

Some Traits of a Good Shepard

By Andrew McPherson, Rocklin, Pictou Co. N. S.

Editor Maritime Farmer:—

Before the first April issue of the Maritime Farmer reaches its readers, the lambing period, in a good many cases, will be over for this season; but, there are yet quite a number of farmers, who believe that the latter part of April and the first week in May is the best time to have their lambs come. To those we would offer a few suggestions that may be helpful in this most critical of all periods, in the life of the flock; because now is the time to "make good," for the whole year's work. Every lamb saved and sent to the pasture with the flock means the difference between success and failure, or between profit and loss.

In travelling through the country in the summer season, in localities where nearly all the farmers keep small flocks of sheep, does any of the readers recollect seeing a flock where the lambs outnumbered the rest of the flock? Is it not oftener the case that in flocks of from fifteen to twenty ewes, we are able to count only ten or twelve lambs, and sometimes not that many? Knowing as we do, that every ewe should have at least one lamb and that a great many bear twins, how are we to account for the scarcity of lambs, in count for the scarcity of lambl? In the natural order of things, at least one or two lambs should be skipping by their fleecy dams.

Of all the domestic animals, sheep are the most helpless, and look upon the Shepherd as their protector and friend, and, when trouble comes, as come it will in the best regulated flocks, if the Shepherd is not on hand to give the necessary help, too often, the result is a dead lamb or perhaps two.

As we know the time the increase of our flocks is expected, it is good policy to have everything in readiness. Having the ewes in good condition for this trying time is of the first importance. We have a mortal dread of a skinny ewe, as in most instances she will disown her lamb, even if it is worth while to save it, and very often is not.

"Ewes well wintered are half summered," is an adage that is as true as it is old, and if we commence to feed a little oats and bran about a month or six weeks before lambing time, ewes that have no disease, should be in a condition to bring forth strong, healthy lambs, that will be looking for nourishment a few minutes after being dropped.

We find it good practice to have a few hurdles ready to separate the ewe and lamb from the rest of the flock for a day or two. When we see signs of approaching pertuntion, and the careful Shepherd will see those signs of approaching parturition, and event takes place, then we can pen the ewe by herself and the chances are she will be able to take care of herself; but if not, always be on hand to render help if needed. Nothing shows the Shepherd instinct better than a willingness, during the lambing period, to get out of a warm bed, on a cold night, to see if all is well in the sheep fold.

If everything goes all right there is not much to do but leave them alone. Sometimes a young ewe will be excited and will not allow the lamb to get any nourishment, in which case she has to be held, as the new milk is the best medicine for giving the young lamb his first feed. Once the little thing gets a belly full the trouble is about over.

In every case it is a good plan to shear the wool off the ewe's udder, as it gives the lamb a better chance and also prevents the danger of wool balls forming in the lamb's stomach, which often causes death.

As the new milk is very laxative, we have to watch that obstructions do not form at the root of the lamb's tail, thus preventing the bowels from performing their functions. If the obstruction is not removed it will harden and soon cause death.

White scours is another trouble that causes a great mortality among young lambs. This trouble often occurs when the ewes are fed too rich food, such as ground peas, corn meal, etc. The remedy is to cure the lamb through the mother. Change the feed to bran, turnips or anything that is of a cooling nature. However, if the lambs scour very badly they should be taken off the ewe altogether for a short time and given milk, from a fresh calved cow, slighty diluted and a little powdered chalk added.

Lambs are playful and should be allowed to indulge themselves to the utmost by providing a run or creep where the ewes cannot go. By putting a little ground oats and bran in a clean trough and renewing this every day they will soon be helping themselves and the benefit derived therefrom will be noticeable.

DOCKING AND CASTRATING. — The males should be attended to while the lambs are quite young, at two weeks old is about the right age, if the weather is not too cold. Docking does not affect their growth at all and gives the lambs a more uniform appearance and prevents dirt and filth from adhering, as is quite apt to be the case, when they are first turned out on grass. If the ram lambs are to be kept until late in the summer, castrating should not be neglected as they will fatten better and be less troublesome to the rest of the flock.

As spring advances sheep get restless in the yard and are seeking every opportunity to get out, and, sometimes to get them out of the way, they are turned out too early.

We think it good practice to shear the sheep and gradually get them accustomed to the change before turning them out of the yard. By shearing a few at a time and covering them with old bags or sacking, of any kind, until they get used to going without their warm fleeces, and prevent them from catching cold, by turning them out in a dry pasture, for an hour or two every warm day.

As they will refuse to eat hay in the barn after getting the taste of grass, we are apt to jump at the conclusion that they are getting plenty to eat in the pasture, and foolishly withold all bran feed from them. For this time we like to tempt their appetites by having a load of early cut, well cured clover hay stored away to give them when taken in at night. This in addition to a small feed of whole oats for the ewes and ground oats and wheat bran for the lambs will get them used to summer conditions, without too violent a change from winter feeding to the tender lucious grass that has such a loosening effect on the bowels.

About a fortnight or three weeks after shearing, if the weather is mild enough, the lambs should be dipped. The ticks, by this time, are all on the lambs and a good dipping will generally insure a clean flock. In the fall the whole flock should again undergo a thorough dipping before going into winter quarters. It is astonishing to note the difference in the amount of feed a clean, well dipped flock will require to take them through the winter and that required by a flock over-run with ticks.

After the flock goes to pasture, there is not, or should not be much more trouble except that the Shepherd will have to keep his weather eye open for any unforeseen emergency.

Shade, water and salt should always be accessible and change of pasture, several times during the summer, is advisable. If a dozen furrows are ploughed, on some dry knoll, we will see the sheep gather there several times a day in hot weather, and raise a cloud of dust by stamping with their feet. This is "sheep instinct" and is done to prevent the fly that causes grub in the head, from getting in its work. The question of raising supplimentary fattening feed for shortening the winter feeding.

Fattening lambs, etc., is another story that may be taken up later, if of sufficient interest to Maritime Farmer readers.

IN PASTURES GREEN AND BESIDE THE STILL WATERS.

President Bright's Address at Canadian Clydesdale Breeders' Association

To be able to meet such a splendidly representative gathering of horsemen at the 23rd annual meeting of the Clydesdale Horse Association of Canada is a great pleasure to me. It is a greater pleasure, because, meeting as we do, at a time when other attractions are absent, I know that it is not a horse show that has brought so many brother horsemen from all parts of Canada together but a genuine interest in the welfare of Canada's one greatest horse—the Clydesdale. Such a gathering as this now assembled speaks volumes for the wide appreciation of the present status of the Clydesdale horse of Canada, agriculturally and commercially, and augurs as well still greater things for the future.

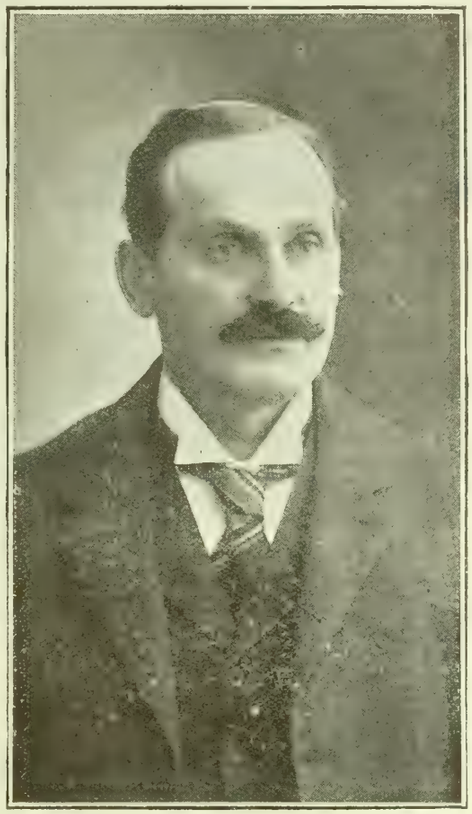
I may say, not boastfully, that the officers and directors of the Clydesdale Horse Association of Canada are proud to meet so many of the members of the Association here today. We are proud of the co-operation, steady and unwavering of the leading horsemen of Ontario, Quebec, the Maritime Provinces and the great broadening provinces of the Canadian West, where the Clydesdale horse holds sway, just as he ever did in old Ontario. We are proud on meeting you to-day, to be able to present to you the best financial report that has ever been presented to an annual meeting of the association, and to report to you, the best year in the history of the Clydesdale horse of Canada, all along the line. There has been a record scored in importation. More horses have been selected and brought to Canada for the improvement of the breed than in any previous year. Not only is this the case but there has been a great and commendable increase in discrimination in the kind of horses imported for this purpose. Never have such a large number of such high-class animals crossed the ocean to Canada before.

Canada has made historical advancement in horse breeding and in prestige abroad as well as at home. At the New York Horse Show, Clydesdales from Canada swept the boards, at Chicago Canadian prestige was upheld as usual. It has become the usual thing for the Canadian Clydesdales to win at Chicago. While Canadian bred Clydesdales were winning admiration and applause on the shores of the Pacific, at the World's Fair at Seattle, away far across the Atlantic, in the old land that magnificient Clydesdale gelding Bobby Burns with his splendid Canadian bred mate were commanding the homage of the best horsemen of the old land, as they toured Great Britain and the Continent in the famous six horse team of Morris and Co. I am glad to see before me the face of our old friend, Alex Doherty, the breeder of this famous Clydesdale.

I would say to you gentlemen, Clydesdale breeders of Canada, that is every Clydesdale you own, you have an asset second to none in the Dominion of Canada. You are able to turn a Clydesdale, be it stallion, gelding or mare, into cash, just as readily as you can turn a bank note into cash.

Surely we have come to a very happy time when we have realized that enviable position. There have been times when we considered Clydesdales to be very valuable assets, but it has sometimes been difficult to find out what its cash value was. Everybody knows to-day what the cash value of a Clydesdale is. It is above par, it is at a premium. It is an asset which more people are looking for, trying to purchase to-day than any other that I know of.

Our Western Friends:—



JOHN BRIGHT.
President Canadian Clydesdale Breeders' Association.

We have with us many horsemen from the Great Canadian West. They are enthusastic Clydesdale men as any of us. At the present time there are many more throughout Ontario and Quebec, looking for just about one thing, and that is Clydesdales. Some of these gentlemen tell me that it is nearly impossible to induce horsemen to part with them, at any reasonable price. I would say to all, do not hold your spare stock too high. Sell them at a fair price, and give the other fellow a chance. We need to encourage the Clydesdale in the West. It is a great country, with a great future, and it will be well to see that the ground work for a great Clydesdale country is laid at the same time.

Another recommendation I would make to whomsoever may be selected to rule the destiny of this great Association is to endeavor to give larger grants to Western Canada for the encouragement there of Clydesdale horses and their progeny. We have increased grant made for this year to the Manitoba Winter Fair. This association can now afford to treat the Western interests more liberally, and it will be money well spent, if it encourages them to go to Scotland, or come to Ontario and select better and better horses each year as the foundation for the breeding stock of the West. While it is a wise policy for any Association to save up some money for a rainy day, what I would like to do is to strain every nerve to keep the Clydesdale business to the front throught all Canada, and to keep it going. I would like to see the Clydesdale Horse Association of Canada doing its full share in inducing the people of the West to buy the right stuff, that will lay the foundation for such a Clydesdale horse for the future as will beat the horse of any other breed that comes up against it first, last and all the time.

Gentlemen, we are all proud of the stand which the Clydesdale has taken in America. We are proud of the grand array of Canadian farmers who rely on him in their business, and of the exhibitors who have carried off the best prizes where ever they have shown their Clydesdales. And I am proud gentlemen, that you have for the third time elected your humble servant as head of this great Association, The Clydesdale Horse Association of Canada.

DONALD INNIS' HOME IN SUMMER TIME.

More about the Bounsing System.

A St. John reader sent the following clipping from the Telegraph, St. John, to which he adds,. Why not give a bounty to the farmers if they are worth $20,000,000 when the fishing industry is only worth $6,000,000 and the lumbering interests $7,000,000? What does our farmer readers say re this matter?

"John F. Calder, of Campbello, inspector of fisheries for St. John and Charlotte counties, arrived in the city yesterday and registered at the Victoria. The news of Mr. Calder's arrival will be received with pleasure by the fishermen here, as he brings with him their fishing bounty checks. To The Telegraph last evening Mr. Calder said that he had seventy-five checks for the fishermen of St. John county and 630 for those of Charlotte county. The checks range all the way from $4.25 to $40. Asked as to what the fishing prospects for the coming season were, Mr. Calder said they never looked brighter. The prices for dried fish, such as hake and pollock, were rising almost daily. The contracts for sardine herring also show that the fishermen will realize better prices in this line than they ever did before. The lobster fishing, Mr. Calder said, was extremely good during all the winter. He attributed this to the fact that the extremely mild weather made it possible for the fishermen to attend to their traps almost as regularly as they do in summer. New traps for lobster fishing are at present being built, the inspector said, which means that they have got a month's start this year over last.

Wilson's Beach at Campobello presents a very busy appearance just at present, Mr. Calder said, as fifteen new gasoline fishing boats have been added to the large fleet of 110 which were previously stationed there.

Mr. Calder says that present indications point to a very heavy tourist traffic at Campbello during the coming summer. Several new cottages are now being built to meet the demands. Mr. Calder will leave for Chance Harbor on Wednesday and from there he will make a tour through Charlotte county."

A Link Between East and West.

A remarkable example of the advantages of making reliable goods is to be found in the demand which comes from the great Canadian West for the pure wool tweeds made by the Hewsons of Nova Scotia. Soimany people have gone West from Eastern homes where the name "Hewson" stands for all that is best in cloth and knitted goods, that the call comes back for the good, strong, comfortable woolens that the boys used to wear "at home."

History of The Clydesdale Horse From their Foundation.

By Prof. D. McEachran, LL. D., F.R.C.V.S,D.V.S., etc.

A legend has it that about 1715 the Duke of Hamilton brought home with him from the Continent of Europe five big black Flemish horses, which he gave to his tenants for the improvement of their stock.

Unfortunately, no records of this have been discovered, and some there be who doubt the accuracy of the legend. However, it may be, we have the knowledge, in support of it, that to his tenants in the upper wards of Lanarkshire are we indebted for the improvement in size and quality of this famous breed, whether we ascribe this to these Flemish importations, or to selection, proper mating and feeding by these men; to them belongs the credit of improving the Clydesdales throughout Scotland.

From Lanarkshire, Clydesdales found their way into Ayrshire, Argyleshire, Dumfrieshire, Kirkcudbrightshire, into the Lothians, Aberdeen and other counties of Scotland. At an early date, the stock-drivers into the North of England were, in times of peace, regularly conducted, and no doubt, Clydesdales were brought south and sold to farmers of the northern shires, Northumberland, Cumberland, Yorkshire and Lincolnshire, where they were mated with the old black cart-mares, which had also been improved by European importations.

This, as stated by the late Sir Walter Gilbey, led to the development of the Shire horse as we know him to-day, a horse of more weight, heavier but rounder bone, a truly magnificent draft horse for heavy work at a slow pace.

As was to be expected, many of the English breeders continued to present day, every spring, the agricultural societies of the English shires compete with the Scotch in premium-giving for the service of Scotland's best horses, with the result of producing as good and as purebred large-sized Clydes as are to be found anywhere. The great majority, however, adhere to the Shire horse, which has long been recognized as a distinctive breed, and registered as such.

THE CLYDESDALE HORSE IN KINTYRE.

In Kintyre, my native land, a fertile peninsula in the sauthwest of Argyleshire, Scotland, till about one hundred years ago, they bred Highland cobs, a short-legged handy little horse, which furnished an admirable loundation for the improvement in size then about to take place. About 1820 Sir Charles Lockhart, of Lee, sent to his highland estate, Largie Kintyre, a large black stallion, of the improved vale of Clyde horses, which proved a most fortunate cross, for to him date back the improvement in size and form of Kintyre horses, which have played an important part in Clyde breeding the world over.

STABLES OF PROF. DUNCAN McEACHRAN MONTREAL.

From then till now many of the most noted sires travelled in Kintyre, such as Farmer's Fancy, (298), Glancer, alias Clyde (153), Rob Roy, (714), in early days, producing such horses as Black Leg, (71), imported to Australia; Ivanhoe, (396); Sir Colin, (772) and many others, and in more recent times, Prince Alfred, Fitz James, Old Times, Florizel, Gay Everard, Garthy Cashier, Lorne etc., travelled there. Many of the prize winners of the present day were bred there.

For a long period, Kintyre was justly celebrated for producing prize-winning Clydes, and to-day as good blood exists there as in any part of Scotland. True, owing to the influence of the late David McGibbon, factor for the Duke of Argyle, several of the Riddell-Drew Clyde-Shire-cross stallions travelled there for a number of years, and many of the best Clyde families there are in the meantime excluded from Canadian registration and imporsation. Notwithstanding this, many mares of purest pedigree are there mated to the best of Clyde sires and many of the prizewinners in Scotland have been bred there, and not a few from my native country have enriched Canadian Clyde breeders. The celebrated Silver Cup served there during the past season, and for the season of 1910 a very promising young horse, High Degree, one of the best of his age in Scotland, has been secured, £100 premium being paid and his terms to be £3 at time of service, and £4 when the mare proves in foal.

SELECT CLYDESDALES.

The early sixties mark an epoch in Clyde breeding in Scotland, when David Riddell and Lawrence Drew visited the northern English shires, and brought back with them some Shire fillies and set about breeding a select Clyde, such as attracted their attention in England, a larger type of horse with more bone and well-haired legs. It is not to be wondered at that this step was strongly resented by the pure bred Clydesdale breeders, when Riddell and Drew, with the produce of this cross, such horses as Prince of Wales, Darnley, Banker, etc., swept the show-rings and outsold them both by private sale and under the hammer.

From this time, two factions existed in Scotland among Clyde breeders, Drew and Riddell working for the large-boned, heavy type, represented by such horses as Prince of Wales, Darnley, Banker, Sir Walter Scott, The General, and a host of others; and another faction working for lighter bone, flatter leg, less hair on the legs, larger feet, longer and more oblique pasterns. At the head of this type is Baron's Pride, by Sir Everard, by Top Gallant, dam Forest Queen, by Spring Hill Darnley, and a long list of his progeny, Baron o' Buchlyvie, Pride of Blacon, etc. Andrew and William Montgomery, the Clydesdale kings of Scotland, as owners of this phenomenal horse, must assume the responsibility of the new type of Clyde.

It must not be supposed that the little, neat type of horse, too long sought after by Canadian breeders and by Canadian importers, which until recently were representative of the show-ring class of Clydes, will continue to be sought after. If we visit the extensive establishments of Andrew Montgomery, at Netherhall, or William, at The Banks, our minds will be disabused of that idea; at both places ponderous animals predominate, and if you want size combined with quality, you can find it there.

If asked what my views are as to the points of variance by these two factions, my answer would be: Combine the two; let the show-ring judges judge by points, and give more value to the general conformation, size, weight, color and action; give up the present exclusive attention to feet, oblique, long pastern; flat, light bone, and clean legs—all of them important; nay, imperatively so—and base their decisions on the essentials of strength, endurance, soundness of body and constitution, prepotency, breeding, action and color—a combination of qualities which give the animals the highest commercial value. Let them carry themselves erect, and in their line of vision take in the whole horse and not his feet and legs only.

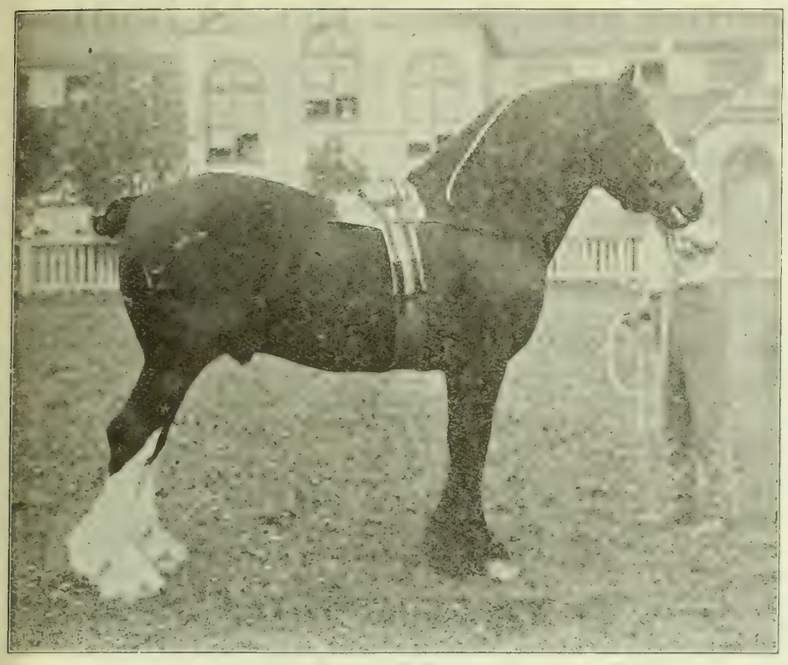
While not agreeing with David Riddell in everything, I am bound to say that he did a great deal for Clydesdale breeding in Scotland, and a great many good ones came to Canada from his stables. For these reasons, I take pleasure in quoting the following extracts from a Glasgow newspaper of November, 1908, being the report of a dinner and presentation of a portrait in oil to him by his numerous Clydesdale-breeder admirers: "Mr. Riddell's services to the breed of Clydesdale horses lie mainly in the fact that he retained the great horses, Prince of Wales and Darnley, in this country, when the demand for such horses for exportation was very strong; so that, had he parted with any of these horses to any foreign buyers, the whole course of Clydesdale history would have been different from what it is. Had he sold Darnley for exportation, for instance, there would have been no Top Gallant, no Sir Everard, no Baron's Pride; and had he sold Prince of Wales to any foreign buyers, there would have been no Prince Roberts and no Hiawathas.

Mr. Riddell was on the right lines of breeding all along. He brought out The General, the sire of Prince of Wales, and he also brought out Sir Walter Scott, the sire of The General, and also Old Clyde, the sire of Sir Walter Scott: and besides, he put through his hands Samson, the sire and dam of both Prince of Wales and Darnley. So that he was well entitled to be called the Grand Old Man of the Clyde breed."

I extract the following remarks from Mr. Riddell's speech at the presentation dinner already referred to as worthy of our consideration.

"One of the most remarkable of his asociates in Clyde breeding was Lawrence Drew. Taken all in all, he was a man of rare gifts, and, above all, a trusty friend and thorough gentleman. When he thought of the type of draft horses which was in fashion when he was a young man, meeting such men as Samuel Clark,

A SPLENDID DRAFT TEAM



ROYAL BARON (4722) (3161)

is a son of Baron's Pride (9122) Vol. XIV. Sire of Royal Baron's Pride, 9470, who was first in his class at the Maritime Horse Show, Amherst. Royal Baron's Pride is owned by Hugh R. McMonagle, Sussex, N. B.

ROYAL BARON'S PRIDE, 9470.

3rd Dam Nellie	Sire Monkbarns.
4th Dam Kate	Sire Scotland's Glory.
5th Dam Mag	Sire Young Comet.

Peter Crawford, William Park and Robert Findlay, of Spring Hill; and again, when Mr. Drew and he went to Lincolnshire and other parts of England to buy mares and fillies, the change struck him forcibly, and they of the younger generation would perhaps pardon him when he said there was danger of overdoing the fancy points, to the neglect of those which were of the utmost importance for work and durability."

In the North British Agriculturist, 7th October, 1891, is a report of a Clydesdale Symposium, where nearly all the prominent breeders of Clydes in Scotland met at Professor McCall's stock farm. Alexander Galbraith, of Janesville, Wisconsin, said: "Clydesdale breeders are making a fatal mistake in making big feet and long, sloping pasterns the 'be all and end all' of draft breeding."

Professor McCall supported this view. Mr. Galbraith agreed with Professor McCall in saying that very large feet were sometimes a positive source of weakness to a horse.

A good-sized, well-shaped foot, with moderate length of pasterns, were much to be preferred in draft horses to unduly big, wide feet, for the above reason.

THE CLYDESDALE HORSE FROM THE UTILITY STANDPOINT.

I have been asked why I prefer Clydesdales, and selected them as the breed to which I am devoting my time and money. Various circumstances have contributed to that decision. In the first place, probably my acquaintance with the breed since my earliest recollection. It is truly said, "Find a Scotchman where you will, and you will find the Clyde horse." My countrymen are all well known to be frugal in their habits, and they would not long stick to the Clyde horse unless he aided them in their thrift. He does that in a marked degree. The Scotch farmer has to contend against a rugged climate and high rents; he must of necessity work his land so that it returns the maximum possible for his labor and outlay. Lighter horses than Clydes would not enable him so to work his land as to do this. I know of no other breed of horses which can compare with the Clyde for lasting qualities and economy of keep. When carefully bred, an unsound Clyde is a rarity; as a rule, he is sound in his feet, has good bone, well-muscled, is a good feeder, and always ready for his work, and thrives on such food and work as would kill most other breeds. He is to the Scotchman what the old French-Canadian horse was to the habitant.

My professional experiences, extending over nearly half a century, gave me opportunities of seeing and comparing all the known breeds of horses in North America and Europe. I have had for many years the professional charge of most of the large transportation stables in Montreal, where I made careful study as to which breeds were most profitable, considering durability, cost of feed, and freedom from disease, and I have no hesitation in saying that no other breed will meet these requirements as well as the Clyde.

I have been extensively engaged in

(Continued on page 407.)

BEAUTIFUL CAMPBELLTON FROM CROSS POINT, NEW BRUNSWICK.

Seed Selection as Practised in Europe--With Wheat, Oats and Barley.

Prior to 1906 I frequently took occasion at farmers' meeting and elsewhere to state my belief that by continued selection from year to year of the best heads of wheat, oats or barley, from the best and most vigorous plants, the productive capacity and quality of these grains, and also the strength of straw and its rust resistance, could be gradually but materially improved, much to the benefit of the farmer. I have not changed my opinion as to the principle; but, from a study year by year of the results of selection by members of this Association, followed last summer by an opportunity to see the work of experts who have devoted the greater part of a lifetime to a study of plant improvement, I have modified my views as to the extent to which improvement may be made by mass or multiple selection, which is the principle of selection that is embodied in the constitution and instructions issued by this Canadian Seed Growers' Association.

EXCELLENT RESULTS FROM MASS SELECTION.

We can not expect the farmers in the different parts of Canada, who are making a specialty of growing and selecting seed grain, to compile accurate records that could be used to advantage in support of an argument in favor of mass selection. But I have had occasion to visit and inspect the work of many of the prominent seed growers, and, more frequently, to discuss with them the progress they have made. Fully 85 per cent., I should say, of the farmers who have been doing this work know full well that the crops they now have, as the result of several years selection, are more uniform in character and capable of giving larger yields of grain per acre than the crops from unselected seed of the original stock that is commonly available for comparison on adjoining farms. Many of those farmers who commenced with the common kinds and varieties of grain, which had been grown by them or in their district for many years, obtained what might be justly called excellent results as the reward of the first three years of careful selection.

IMPROVEMENT BY SELECTION IS LIMITED.

Since 1906 the observations which I have been able to make and a study of the work that has been done in other countries, have gradually led me to the opinion that the success of our seed growers who are doing the work of mass selection with varieties of wheat, oats and barley which they formerly grew, has depended, to a greater extent than some of us believed, on the care exercised by them when making their first selection. If in making their first selections they picked one or more heads from plants of outstanding merit, then by degrees their process of further selection would be likely to increase those specially desirable plants which they had by their first selection introduced into their breeding plot. If, however, on the first selection they were not so fortunate in collecting heads from outstanding individuals of merit, then their results since that time have afforded them less encouragement.

The system of mass selection now followed with cereal grains by members of the Canadian Seed Growers' Association has, until quite recently, been adhered to by German seed growers. During my visit to them last summer, I took occasion to outline the methods employed by the members of this Association to different men whom I met and who were engaged in the work of plant improvement. They all seemed to be thoroughly familiar with the plan and the principle it embodies and several whom I met are continuing with that plan in modified form. Nearly all of them have been influenced by, and are now adopting or incorporating into their methods, the principle that has been so effect-

A TYPICAL ANGUS BULL.

A WELL EQUIPPED MAPLE SUGAR MAKING CAMP.

ively applied in the improvement of crops by Prof. Hjalmar Nilsson at Svalof, in Sweden, whose methods of work I desire to present in this paper. I will read directly from transcribed notes I made at Svalof while in conversation with Prof. Nilsson.

SVALOF (SWEDEN) EXPERIMENT STATION.

Svalof is situated an hour and a quarter by train north of Malmo. The principal experiment station in Sweden, which is under the direction of Prof. H. Nilsson, is located at Svalof. The institution is a private one but is supported by the government of Sweden, the agricultural societies, subscriptions of members and some slight revenue as follows:—

Swedish Government, ...Kr.	40,000	$10,000
Agricultural societies, ...	20,000	5,000
Swedish Seed Company	10,000	2,500
Members subscriptions	5,000	1,250
Revenues	5,000	1,250
Total	80,000	$20,000

Cost of scientific building, Kr. 300,000.

1 kroner equal 27 cents.

The scientific staff is composed of Prof. Nilsson, five specialists and their assistants and laborers. The scientific grounds include about 30 acres (15 hectares), but the staff makes use of any area required by them to grow isolated plots on the grounds of the General Swedish Seed Company, which comprise about 5,000 acres, 1,200 acres of which immediately surround the scientific grounds.

The organization of the scientific staff at present is as follows as to their work:—

1. Specialist for barley, peas and vetches.
2. Specialist for wheat and oats.
3. Specialist for grasses and clovers.
4. Specialist for potatoes.
5. Specialist for rye.

Provision is made for enlarging the staff to include ten specialists, each of whom will give all his attention to the improvement of one particular crop.

In addition to the station at Svalof, where the principal work is done, stations for test plots and further scientific work are maintained at 5 degrees north (near Stockholm) and another ten degrees north, which is at the northern part of Sweden These sub-stations are in charge of assistants to the members of the principal staff at Svalof, who visit them frequently for the purpose of working out the best selections of the various crops for the districts represented by the stations.

RESULTS OF MASS SELECTION AT SVALOF.

Prof. Nilsson, as a trained botanist, worked as a specialist for several years under the direction of his predecessor. His work from 1888 for six years was based on the advantages of selection alone, so called "mass selection." Large heads were picked by hand and by the use of an automatic appliance; the heaviest were set aside and used as improved seed. From these, only perfect kernels, showing good quality were taken, the object of the selection being to secure stronger straw, earlier maturity, greater immunity from rust, as well as increased yield.

Observation taught him that plants having not more than three stools ripened more uniformly. These therefore were selected, care being taken to keep the plants uniform in characteristics. Only the primary head was selected and of these, only those of heaviest weight per machine test were set aside for improved increase.

After six years he found that, as compared with the original non-selected and impure stock, he had increased the yield, due, he states, to the elimination of undesirable forms of weakling plants; but very little, if any, increase in yield was secured after the first two or three years.

As to the main characteristics of the plant, including strength of straw, immunity from rust, improvement in quality of grain (except because of the undesirable mixtures), and earlier maturity, no improvement whatever had been made as compared with crops from the original stocks.

Collateral tests were made with Chevalier barley, by using only the heavier seed from the centre of the ear or spike.

His unalterable conclusion, drawn from an immense amount of careful work in this plan of selection, was and is that the plant cannot be forced in a way, to alter its main characteristics by the adoption of any practices at present known. This was disappointing to the Svalof staff especially because the farmers of Sweden had been promised by Prof. Nilsson's predecessor that, as a result of their financial support, he would in a few years be able to provide them with varieties of grain far superior to the common sorts then generally grown and especially with what was most needed, varieties of grain with stronger straw and this was to be secured by selection alone.

SELECTION BASED ON INDIVIDUAL PLANT.

In 1890 and 1891 he had selected in the open fields in different parts of Sweden 1,000 or more individual barley plants of seeming merit. He sorted them into three groups according to apparent type and dibbled the seed into plots. The resultant crop from each type proved to be a motley collection of individual plants, markedly not uniform in many important characteristics, as maturity, stooling strength of straw and rust.

In 1892 Prof. Nilsson commenced to base his improvement on the individual plant of outstanding merit, considering a combination of desirable characteristics.

The principal work, the most difficult task, is to locate and separate out the best individual. Prof. Nilsson and his staff spent much time in patiently searching in the common grain crops throughout Sweden for individual plants of superior qualities. These he calls "mutants", or sports that will increase true to type, mostly, he thinks, due to natural cross-fertilization, which occurs in nature but rarely. He has found such sports, the type of which were not fixed but would continue sporting in a manner quite similar to the product of artificial crosses, and under conditions of growth whereby the plant so located as a sport must surely have been produced by natural cross-fertilization. To a trained specialist, who devotes his entire attention to the study of one, or at most, three kinds of crops and their improvement, the occurrence of mutants in ordinary field crops is quickly observed. They occur in relatively large numbers, but exceedingly few of them are worth transferring to trial plots for comparison and further study. These trial plots lead up to discarding thousands of the individual "mutants" that were selected and retaining but an occasional one. The cereal crops of the south of Sweden are largely traceable to these mutant individual plants that were discovered, isolated and increased by Prof. Nilsson and his efficient staff.

Prof. Nilsson frankly states that although he has also faithfully followed the work of artificial cross-fertilization since 1904, the product of his labors in that work has thus far been small and the outlook not hopeful when compared with the method of searching for and making use of those individuals that already exist in their excellence and have to some extent proved their superiority on the soil and climate where they are needed. He is, however, by no means discouraged with his work of crossing artificially. That will be continued by him and his staff as a work of secondary, though of much importance, a work worth doing well on the chance of constructing in one individual, characteristics and qualities not found in available "mutants."

The mutants discovered as the result of persistent search, as well as the individual plants that result

(Concluded on page 404.)

Barred P. Rocks

Our claim to be the foremost breeders of this variety in Eastern Canada has been established by ten years of the keenest competition in the show ring with this class of birds. Our latest triumph at the Amherst Fair, winning, for the second time, the trophy for the best cock, hen, cockerel and pullet, of any variety, and the specials for the best shaped and the best colored bird of this kind, seals the fact. First cockerel, first pullet, first hen and second cock at Amherst means quality now. First cockerel, first hen, first pen and second cock at Halifax, all in one year, endorses it. Stock and eggs for sale. Satisfied patrons our aim.

CRAIG BROS., = Amherst, N. S.

We Want Beef and We Will Have Beef

STEADING OF SAMUEL FREEMAN, AMHERST, N.S.

Editor Maritime Farmer:—

From time to time,you give considerable space to the breeding, raising, feeding, housing and care of the dairy cow, and many valuable ideas are expressed on the best methods of producing and preparing the dairy products for market.

May your good work along this line continue, until the average yield more, and larger dairies are profitabmore and larger dairies are profitably supplying our markets with choice products of the dairy. But we must have beef, and we will have beef.

The people of these Provinces want good beef. Can the farmers meet the demand of our home market, without the aid so kindly given them by the Ontario stockmen, and the Chicago packer?

We hear much about the "cost of living" in towns. If the producer of beef count the cost of his finished product, on the business principal we are told to use in connection with our farm work, viz., a moderate profit, above interest on capital invested, a reasonable amount allowed for depreciation of equipment, barns, fences, etc., actual cost of feed, and a fair remuneration for time employed, not necessarily to be compared with the cost of the plumber, the painter, the paper hanger, or the time of other vocations, of the residents of the towns, he need not have any pangs of conscience, at asking even all the so called, present high price of meat will permit for his output.

If there is a large profit, to be easily derived from making beef there are opportunities, for many residents of the towns to avail themselves of the advantages of the ease, country life affords, and so enjoy the continual picnic, and short work hours their utopian visions furnish of farm life.

Many sections of these Provinces by the sea, are certainly capable of producing a considerable quantity of good beef for our markets, without in any way interfering with the out put of the dairy.

By the use of pure bred sires of beef breeds, and the cows at present kept on many farms, young stock would be produced, that with a bit of care would make, at from two to three years old, beef animals of good type and quality.

Much has been said about the rearing of the dairy heifer in your paper. What would apply to the health and growth of the dairy animal might be applied to the one intended for beef, adding that the one intended for beef at early maturity, should always be kept in as good condition as circumstances will permit.

During the busy season of haying and harvest it is easy to neglect the calf that up to that time has been fairly well cared for. A tablespoonfull of well steeped flaxseed or of linseed meal can be added to the calf's ration with profit, when the whole milk is gradually changed for skimmed milk, which quantity may be modertely increased as the calf grows older.

A few round oats fed during the first winter, gives a calf a thriftiness that will remain with it for a long time.

Of course it is understood that good hay and a liberal amount of roots are the chief ration during the first winter.

The producer must keep in mind that the young beef animal should be kept healthy and growing and that the feed used should be, as far as possible, raised by the feeder.

The study of the farmer should be, to turn as much as possible of his rougher products to the best advantage. ffi

The ration fed should be controlled largely by what there is to feed, at least expense and most profit. Where much grain is raised, more good oat or pea straw may be used, but here at the head of the Bay of Fundy, hay is our most plentiful article of fodder. Turnips are our cheapest and best food to go with the hay.

There is a direct connection be-

(Continued on page 406.)

WHO SAID BEEF?

What is Good Seed?

In these days of progressive agriculture when the individual and the State are combining forces in an endeavor to place this great basic industry, on a higher plane, we hear much of fundamentals. Leaders in any line of reform, social, commercial or agricultural are only fitted to be leaders when they show a capacity to get down to the foundation of things. To properly comprehend the fruits of any system we must get at the roots. To build safely and to best advantage we must have a good foundation.

In plant life everything begins with the seed. The seed, however, is neither the father nor the mother of the plant it produces. It is the plant itself in miniature. Under proper conditions this embryonic plant will sprout and grow to maturity bearing male and female organs in the flowers of the head. Here fertilization takes place and seed is again formed.

There are many factors which influence crop production but until comparatively recent years the seed has not received credit for being of more than nominal importance. Good seed was taken to mean seed which was large and plump and would grow. It never seemed to occur to any one that the sort of plant from which a seed comes has a great deal to do in determining the sort of plant that seed will produce. The principle that 'like tends to produce like', while recognized in the animal kingdom, was scarcely ever associated with the plant-world and yet we now find that principle to be the corner-stone upon which the plant improver builds his hopes for better things.

The most simple and common form of seed selection practiced at present is known as "the fanning-mill selection." This machine simply separates the large and heavy seeds from the light and small and removes weed seeds and useless impurities. This is a very excellent work and should always be practiced as a necessary compliment to the hand selection of seed from standing plants.

It would be quite as unreasonable to expect to get a good horse mereby weighing him and taking into consideration his general appearance without a knowledge of his ancestry or of his own individual vigor, quality and constitution as to expect crops which will mature evenly and give a large yield of high quality merely by using seed which has been separated out of a heterogeneous mass on account of size and weight alone. Good seed therefore, means more than seed which simply appears good. It means seed which has come from a strain of plants noted for its superior vigor, productiveness and general quality. This suggests at once the necessity of adopting some plan of securing seed whereby the plant itself may be considered. Such a plan constitutes the basis on which the the work of the Canadian Seed Growers' Association is founded.

This Association seeks to aid farmers in carrying out this plan on their own farms and has devised a simple system which is within the reach of every farmer. This system is now pretty well understood but for the sake of those who have not seriously considered the matter heretofore we submit it again in brief as follows:—

The grower first decides upon the variety which is likely to do best on his farm. This is done by testing two or three leading varieties in plots under similar conditions for the first year. The next step is to prepare a special area of land of about one-quarter acre in size and to sow thereon a good clean sample of seed of the chosen variety. When the crop on this plot becomes thoroughly ripe the grower goes through the plot with a basket or sack, picking here a head and there a head, his choice being based upon the vigor and general type, first of the mother plant and secondly of the head which it bears. Enough seed is secured by the selection of these specially desirable heads each year to give a sufficient quantity of seed to sow another plot the following year, while the remainder of the plot is harvested in the usual way and the seed used for the main crop.

The above system of selection is what is known as 'mass' or 'bulk' selection, that is, the selection is made up of seed taken from a great variety of strong, healthy, productive plants and results in raising the average of the crop to a higher plane.

Were a farmer in a position to propagate separately seed from each of a number of specially desirable plants and by a process of elimination and isolation to first discover which is the best and then to propagate the seed from this best plant, he might reach the desired goal more quickly. Such a process, however, involves more work, care and patience than the average farmer can find time to give so it is not generally recommended for use in the improvement of the smaller grain crops although it is the system generally practiced by the Association in connection with the improvement of potatoes and corn.

The improvement which has been effected thus far by farmers operating under the direction of the Association has taken the form of increased yields, better quality, greater uniformity and purity, greater vigor and greater ability to resist disease. Though it may be necessary to continue the selection from year to year, in order to maintain the standard, yet such seems to be justified by the results accruing therefrom.

The opportunities to get something better than we now have are inviting. Every farmer has it within his power to develop better varieties and strains than he is now growing. As a matter of fact, the work can be done to best advantage on the farms where the seed is to be grown. Our Experimental Stations are doing excellent work in testing large numbers of different varieties and in improving some of the best of these, but it remains with the farmer himself to help this seed to adapt itself to best advantage in the place where it is to be grown.

Plant improvement can be made quite as interesting as animal improvement and is much quicker and cheaper. It costs practically nothing to conduct plant breeding work while animal breeding requires considerable capital.

This is the time of year when the prospective plant breeder will be laying his plans. The new beginner will want to know where he can get seed of good breeding to begin on and may also desire further information as to the exact steps to take in conducting the necessary operations. We invite all such to communicate freely with us as we are here to help the individual farmer in his efforts to grow "larger crops of better quality." Address Secretary, Canadian Seed Growers' Association, Canadian Building, Ottawa, and receive full directions.

Steady as a Rock.

The Square Gear

MAGNET CREAM SEPARATOR

Skims perfectly, sitting on the ground or floor.

The double supported bowl cannot wobble.

At our expense you can study MAGNET construction in your own Dairy.

You will find its frame strong and rigid.

It is run by square gears and you know that all good machines are built that way.

The MAGNET Skimming Perfectly sitting on the rough PRAIRIE
THE SQUARE GEAR AND DOUBLE SUPPORTED BOWL DOES IT
STEADY AS A ROCK

Its steel bowl is supported at both ends (MAGNET Patent.)

All other separator bowls have only one end steadied.

The skimmer in one piece, (easily cleaned) takes out all the butter fat and also separates the slime and foreign matter.

The MAGNET Cream Separator delivers good thick cream every day.

The MAGNET Brake circles the bowl, stops it in eight seconds, preventing wear and saves time.

The MAGNET owner can increase the capacity when he gets more cows for a few dollars, by changing bowl and skimmer only.

No matter what cream separator a man experiments with or buys, he will finally settle down to the MAGNET and when he does his separator troubles are at an end.

Why not buy a MAGNET at first and avoid trouble?

The MAGNET is fifty years away from the scrap heap.

AUCTION SALE

An important sale of Pure Bred Clydesdales Mares and Fillies and Shorthorn Cows will be held at the Provincial Farm, Charlottetown, P. E. Island, on Friday, April 29th, 1910. Sale begins at 1 p. m. sharp.

Several prominent breeders will consign to this sale, stock consisting of high class Clydesdales Mares, imported and Island bred and driving horses; also several young Ayrshire bulls and heifers and a few young Shorthorn bulls. Some good grade Milch cows and beef cattle will probably be offered in addition to the above.

Further particulars upon application to the undersigned.

John Richards, Commissioner of Agriculture.

Charlottetown, - - P. E. I.

Cobequid Farm Holsteins For Sale.

Two bulls fit for service from record of merit dams. Three heifers two heifers two years old, and two heifers one year old, bred to Hellon Dekol's Prince. Three young cows, bred to Sir Rooker Posch Artis. Several bull calves from three to six months old. Come and see them.

SAMUEL DICKIE - - - Central Onslow, N. S.

The Maritime Horse Show,

Amherst, Nova Scotia.

The first Horse Show ever attempted by the management of The Maritime Stock Breeders' Association was held in the Winter Fair Building, Amherst, N. S., on the 6th and 7th inst. With no funds in sight, with the exception of a very small sum contributed as special prizes and having to depend wholly for financial support on entry fees and gate receipts, it was, indeed, a brave undertaking on the part of the management to go ahead and offer such a large prize list as they held up for competition in the respective classes.

That the horsemen of the Maritime Provinces were in accord with the movement,, was plainly seen by the large number of entries in the various sections and the very small percentage of those who had entered their horses who were absent.

The weather man smiled favorably on the project and assisted by handing out a batch of what might be called "made-to-order weather."

The citizens of Amherst and horse lovers from all parts of the Maritime Provinces were there, and on every occasion, when horses were being judged the long rows of seats that lined the sides of the track and the reserved seat section at the end of the building were taxed to their utmost capacity.

It is needless to say that President Campbell, and Manager Fuller and the various members of the Directorate wore the smile that will not come off" when they saw how well the show was patronized by exhibitors and general public.

In order to keep up the interest in the judging until the very close of each period, the management, very ingeniously alterated sections of the heavy and light classes and always reserved the best until the last. So keen was the interest manifested, by each and everybody, that there was hardly a seat vacated until the close of the periods.

Prize ribbons, red, blue and white were attached by the judge to the first, second and third prize horses respectively.

Mr. E. C. H. Tisdale, of Beaverton, Ontario, placed the awards in the heavy classes and Mr. A. H. Pearson, Montreal, passed judgment on the light classes.

A full list of the prize winners and their owners is given in this issue.

Clydes, Standard Breds and Roadsters were by far the heaviest classes. There were also some very nice showings made in the carriage class.

Thoroughbreds and Shires had each two representatives.

There was only one pony, which was shown by Miss Della Horton, Amherst.

Hachneys and Percherons were few in numbers but each class contained some excellent individuals.

The Heavy Draught, Agricultural and General Purpose Classes were well filled, Clyde breeding predominating.

The largest number of entries was in the section for Roadsters, in harness, where over twenty horses and carriages were paraded before the judge. The first honor in this class went to Lady Sim, a beautifu, little mare, owned and driven by Mrs. Fred Blenkhorn, Maccan, N. S. We understand Judge Pearson is negotiating for the purchase of Lady Sim. There were many large, strong and shapely horses shown in this class.

The showing in the Clyde and Standard Bred Stallion Classes was magnificent. The cream of the Maritime Province equine family was there.

When one considers the improvement that has been made in the respective classes in the fat stock lines shown at the Winter Fair, in recent years over that shown at the time of the inception of the fair, one is liable to ask the question, will a proportionate improvement take place in as many years in the horse classes? The horse show began by showing a lot of good quality horses some of which were as good as one can find in their class. There will be a general improvement and a more general interest all along the line.

Undoubtedly there are many details that the management encountered in their initial attempt this year that they will be better able to cope with in succeeding years. For the present we know our readers will join with us in congratulating the officers of the Maritime Stock Breeders' Association for the successful culmination of the First Maritime Horse Show.

CLASS I.—THOROUGHBREDS.

Sec. 1.—Stallion foaled previous to Jan. 1st, 1907. 1, "Waterlight," Geo. W. Fowler, Sussex, N. B.; 2, "Herbert," Geo. W. Fowler, Sussex, N. B.

Sec. 6.—Stallion, any age, Diploma "Waterlight," Geo. W. Fowler.

CLASS II.—STANDARD BREDS.

Sec. 1.—Stallion, foaled previous to Jan. 1, 1907. 1, "King Dodds," Dodd Dwyer, Pictou, N. S.; 2, "Oakley Baron," W. S. McKie, Charlottetown; 3, "Maritime Prince," Thos. Munro, New Glasgow.

Sec. 2.—Stallion, foaled during the year 1907, 1, "Oakley," H. S. Bell, Moncton.

Sec. 3.—Stallion, foaled on or after Jan. 1, 1908, 1, Baron Wood, R.

A Scotchman's Experiences in Claiming a Farm Home From New Brunswick Wilds

Master of the Situation in Thirty-Odd Years.

Donald Innis,
Tobique River, N. B.

Editor Maritime Farmer:—

In compliance with your request I am sending you the following synopsis of my experience as an emmigrant to New Brunswick. You wished me to relate my early life in Scotland. I do not think that an account of my early life would be of any interest to your readers. There is, however, one motive that prompts me to write this letter, and it is this: I understand there are number of immigrants coming from Scotland to settle in New Brunswick and should this letter fall into their hands it may be the means of giving them some encouragement as it is the experience of one of their own countrymen who trod the thorny path of emmigration to New Brunswick when conditions were not as favorable as they are to-day and who made a success of his calling on the farm.

I began to earn my own living at ten years of age by hiring to take care of a few cows for a small farmer for the summer. I went to school during the following winter and that was the last of my public school education, because I was at that time, like many more boys of my age, blind to the needs of better education, a fact which I did not realize until years afterwards when I had to face the problems of life and found how badly I was handicapped by not paying more attention to school matters in my earlier days.

For the next ten years I worked on farms in various partl of Scotland, sometimes taking care of cattle and sometimes looking after a flock of sheep.

When thirteen years of age I took care of a flock of 200 breeding ewes and ever since I have had a fancy for sheep breeding.

When twenty-one years of age, I came in contact with some horticulturists who persuaded me to learn the business. I engaged with a large establishment belonging to the Earl of Sefiend, where twelve gardeners were constantly employed in the vineries, greenhouses and conservatories, which covered an area of four acres and which were all under glass.

About this time I was thinking seriously about taling to myself a wife and I consider that the consummation of this thought was the means of making me what I am today.

After seven years experience in the gardens of Cullenhouse, the head gardener got a request from a wealthy lady asking him to recommend a married man who would take care of her garden and act as coachman, and he asked me to accept the position. I accepted the offer, got a good situation, a good salary, a good house in which to live and we began to save a little of our income. After spending five years with this lady, whose family was now growing up and who for the sake of affording her children better educational facilities resolved to remove to the city of Edinburg. This resolve on their part necessitated a change for us, and we began to think of emmigrating to America. We first thought of going to the State of Kansas but while thinking over this matter a pamphlet prepared by the New Brunswick Government, giving great and glowing accounts of the country and good inducements for settlers, fell into our hands. Of course, we did not take all that the pamphlet contained for granted as it was a little too glowing. We thought the conditions over, however, and then we corresponded with the agent who was appointed by the New Brunswick Government to look after matters pertaining to prospective emmigrants, to that country.

Mr. Innis' Cosy Home, where the Stranger is ever Welcome.

The inducements offered were as follows: Every married man with two or more children was to receive a free grant of two hundred acres of land on which a log house would be built and ready to live in when the family arrived. We made up our minds to go to New Brunswick and be our own proprietors. We thought the ownership of two hundred acres of land would see the end of all our troubles. I may say that for five years previous to this I was practically my own master, so far as work was concerned and I did not relish the idea of serving another master, so to make a long story short I contracted with the agent to come to New Brunswick, but he, like most of the agents at that time, lived in one of the large cities and we could get very little information from him.

We had to pay two full fares and five half fares for our passage. If I remember rightly a full fare cost $36.00, which would bring the total fare money up to $162.00. We also paid $40.00 for a stove to be put in our log cabin before we arrived—more about the stove later.

We held a public sale of what little stuff we had and which was well attended by our neighbors who bought our things for as much as they were worth.

Bidding farewell to the scenes of our childhood we commenced a journey which was more trying than we at first anticipated. The care of six young children in crossing the Atlantic is a strain on parents, and especially on the mothers, that is not realized by those who have never undertaken such an experience.

Mrs. Innes was born in Morayshire. I was born and brought up in Cullen, a town in Banffshire, which we left and went to Glasgow where we spent a week with some relatives in sight-seeing. From Glasgow we went to Greenoch, where we boarded the Anchor Line steamer Sidonian, which was chartered by the New Brunswick Government. The Sidonian was not a passenger boat; she was simply a freight boat fitted up with temporary berths between and under decks. Just think of twelve or fifteen families all in one compartment in the hold of a ship for fourteen days, during part of that time the hatches of which were locked. Compare that with the steamers now on the Atlantic. There was a great deal of sea-sickness among the children and some of the older people. We experienced some very rough days on the sea and the weather was very cold while we were in the region of the Newfoundland banks, where we passed some icebergs that presented novel sights to us. The word got going one morning that we would see land about eight o'clock and I can tell you there was some rejoicing and straining of eyes by those who had a lot of children to look after. I think the women especially longed to see land again as they felt the responsibility more than the men. We arrived in Halifax Harbor where the Sidonian called to discharge some cargo, about ten o'clock a. m. We were told that she ,would not leave for St. John till noon:next day, so nearly all the passengers went ashore. It was a relief to get our feet on solid ground again. We had plenty to eat during the voyage but it was not very well prepared and neither tempting nor appetizing for sick persons. Mostly all of us had something good to eat that was prepared for us before we left Scotland.

When about thirty miles from Halifax we took a pilot aboard and all the passengers felt that everything was all right. In Halifax we took our children up town where we went in search of a place where we could get some milk for them. We found all the milk we wanted but now our trouble began about money matters. We had pounds, shillings and pence, and to get this changed to dollars and cents was a big problem, which we got accustomed to after a short time. We left Halifax next day sooner than we expected, and some of the men belonging to our party came pretty nearly being left behind. They had gone quite a distance into the country thinking that the steamer would not sail until noon. The Captain did not purpose waiting for them and was bound to sail and let them come to St. John by train. However, the steamer's whistles were blown long and loud and the men recognizing what was up hastened back

A Harvest Scene on the Innis Farm where the best Seed Grain is Grown.

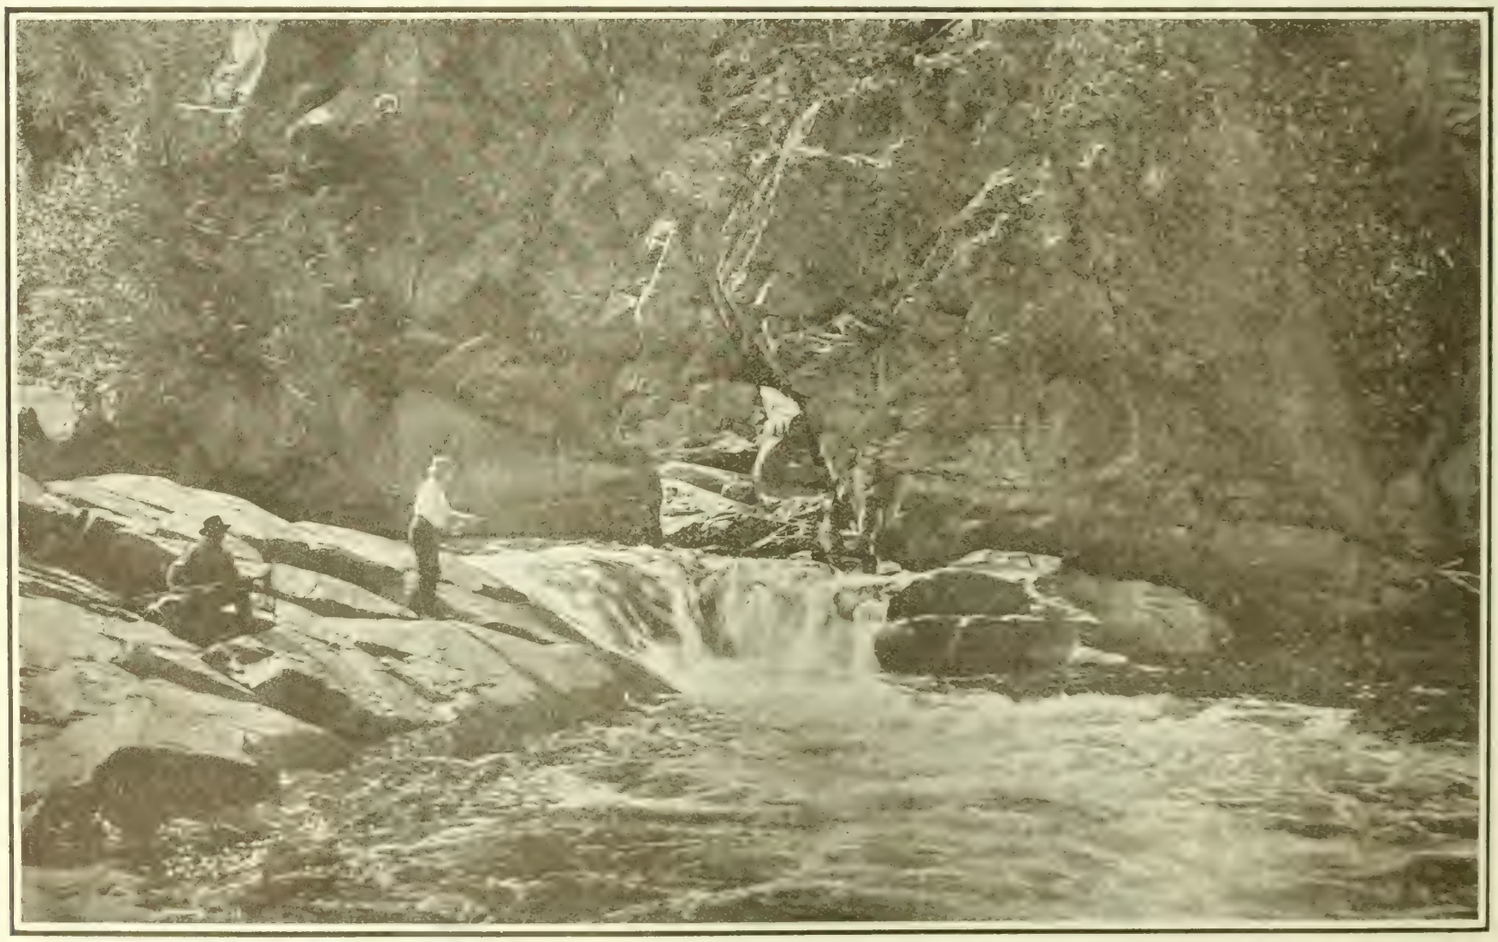
The Steele Briggs Trophy.
For the best exhibit of Seed Grain at the Maritime Winter Fair. Won in 1907,1908 and 1909 by Mr. Donald Innis, who having won it three times becomes its sole possessor.

and got to the wharf just as the deck hands were casting off the ropes and all were happy once more.

I do not know how the passengers found out that the route from Halifax to St. John was a very dangerous one and many of us felt a little nervous over it. We arrived in St. John early next morning and everybody seemed glad that our sea voyage was over.

While in St. John I was offered a good situation by the manager of the St. John branch of the Bank of British North America, to take care of his garden and greenhouse. I consulted my wife about the matter and she said as we had come to make a home for ourselves and our family it would be better to go and see what we could do on the land, so that settled it. We transferred our luggage from the steamer to the train and started for Kintore, the settlement where we were to locate. We got to McAdam Junction about noon where we were to get our dinners. Some of us succeeded in getting something to eat but others did not as the train was due to start while the last of the crowd were eating. The only remedy was to grasp what you could get your hands on and run, some with hard boiled eggs and some with a piece of pie. In passing through such a desolate country as we observed in the vicinity of McAdam Junction, where nothing but rocks could be seen, our hopes began to fail. The prospects were not at all bright to the eyes of those of our party who had come to New Brunswick with the intention of farming. When we left Scotland about the last of April the crops were from four to six inches high; it was now the middle of May and no vegetation could be seen. The country between McAdam Junction and Woodstock, did not look good to us. The trainmen had to stop the train every once in a while and throw water on the heated axles. When we arrived in Woodstock the country began to look better. Here again our luggage had to be transferred from the train to the river boat, which was to take us to Andover as the railroad at that time did not extend beyond Woodstock and was rather disappointing to us as we thought when we left the steamer at St. John our transportation by water was all over. The reader can imagine a crowd of seventy-five to one hundred adults and children crowded on a small boat all night with no place to lie on only the deck. There was not much comfort for those who had a young family to look after. Well, we got to Andover at last and left the boat, or rather the boat left us where the town of Perth now stands. There was no Perth then. When we arrived there, there were teams waiting to take us to our homes in the woods. My family and I were among the first to be sent away on a four-horse team. Oh, what roads, in comparison to the roads we had been accustomed to. My family and our luggage was a load for the four horses and it was the wildest and roughest ride we ever had in our lives. We went up along the Tobique River for six miles and then turned off into the woods on a road that was hardly grubbed out. Our farm was the first on the road and finally we arrived at the home we had come so far to occupy. It looked well to us after the hardships of the previous three weeks. We got our things into the log house and prepared to make things as comfortable as possible. We had all our own bedding which we spread on the floor and were preparing to get the children to lie down when another team came along and the teamster said his horses could not go further, so we had to entertain company for the first time in our new home and they were welcome. After the teamster went away we all lay down on the floor and had the finest rest and sleep that we had had for a month. It was Saturday night and after the children were asleep we older ones talked about the wild beasts we had heard about, until we fell asleep.

Mr. Innis' Exhibit at the St. John Exhibition in 1906.



FISHING AT DAM CAMP WHERE THE DISCIPLE OF IZAAK WALTON FINDS A FINNY PARADISE.

On Sunday morning, a little after daylight, something knocked on the roof of the house. Well, you should have seen we older ones jump to our feet and consult what it could be that made the noise. We dared not open the door for a while and bye and bye the same knocking came again. As it was now daylight, I thought I would take a peep out to see what made the knocking sound on the roof of the house. I thought it might be some bird but the others said a bird could not make a noise like that and I should be more careful. I looked around and could not see anything alarming. But just while I was looking what should come along but a woodpecker that pounced on the roof of the house and solved the mystery. We then directed our thoughts to getting some breakfast. The children, after a good night's rest were all eager to run around. Both families had a supply of food. If I remember rightly the two families numbered fourteen, so it was quite a contract to get breakfast for so large a crowd. The stove I mentioned before was to be set up in the house but we found it lying outside, and we decided to set it up. None of us had ever seen stove before and, do our best, we could not put it together, so we built a fire outside. Where were we to get water to make some tea was the next question? I could see by the lay of the land that there must be a brook down in the hollow, but who would go after it and not get lost? Finally we arranged by placing several members of our party at various distances apart within sight of each other and thus forming a guide-line back to the cabin I went forward and found the brook. There was lots of snow and ice along the banks of the brook on the 16th of May and the prospects for farming were indeed rather blue. The same day a native came along and put up our stove for us.

While eating our breakfast we heard bells ringing and we thought we were not so far from society and that we were hearing church bells. That afternoon we found that it was cow bells we had heard. All this seems silly now and we often have to laugh over it but it was real then.

Well, we went to work to get in some crop. The Government chopped down four acres of the woods so we commenced to clean up a little to put in some potatoes, that never amounted to anything as the frost destroyed them. This was very disappointing for me who had a wife and six children to provide for and my little capital was about all gone. I had bought a cow and her milk was a great help in the family. It was now about the first of August, and I started out to look for work. I found work and kept the same job for two years. When coming up on the river steamer I became acquainted with a gentleman who lived in Andover who kept a place and did a large business in lumbering. He wanted me to go to his place with my family and he would give us a house to live in and give me good wages if I would stay with him and look after his garden and take care of some driving horses. I had declined his offer because we had come to make a home for ourselves. He, however, told me that if ever I wanted work to call on him, so when I wanted work, I applied to him and got a job already referred to. He asked me to work for him all the year round but I wanted to be home in the spring to put some crops in the ground. My wife and I talked the matter over and we thought best that I should stay with the gentleman the year round. It was handy to my home and my family was sure of plenty to eat. While I was working with this gentleman I was gathering things around home, such as a horse and the things that go with a horse to use on the farm.

After two years I went home to work my farm and got ahead by leaps and bounds. One thing that helped me to succeed was that my family stuck to the homestead and helped me to build up the home we now have. One of the drawbacks of this country is that credit is too easily obtained, but thanks to a very careful wife we never got into debt.

We now have a good, comfortable home and Mrs. Innes and myself can take things easy in our old age. Our family of eight are alive and all doing well. The farm consists of two hundred acres and my oldest son has one hundred acres along side of mine that are worked from the homestead. We have about one hundred acres cleared and under cultivation. During late years we have made a specialty of the selection of grain for seed purposes and have made a success of it as most of your readers know who have seen our exhibits at the various Maritime shows.

I do not write this letter in any boasting spirit but in compliance with your request as I thought my experience as an emmigrant might give others encouragement enough to go and do likewise. We have done nothing more than others have done and can do.

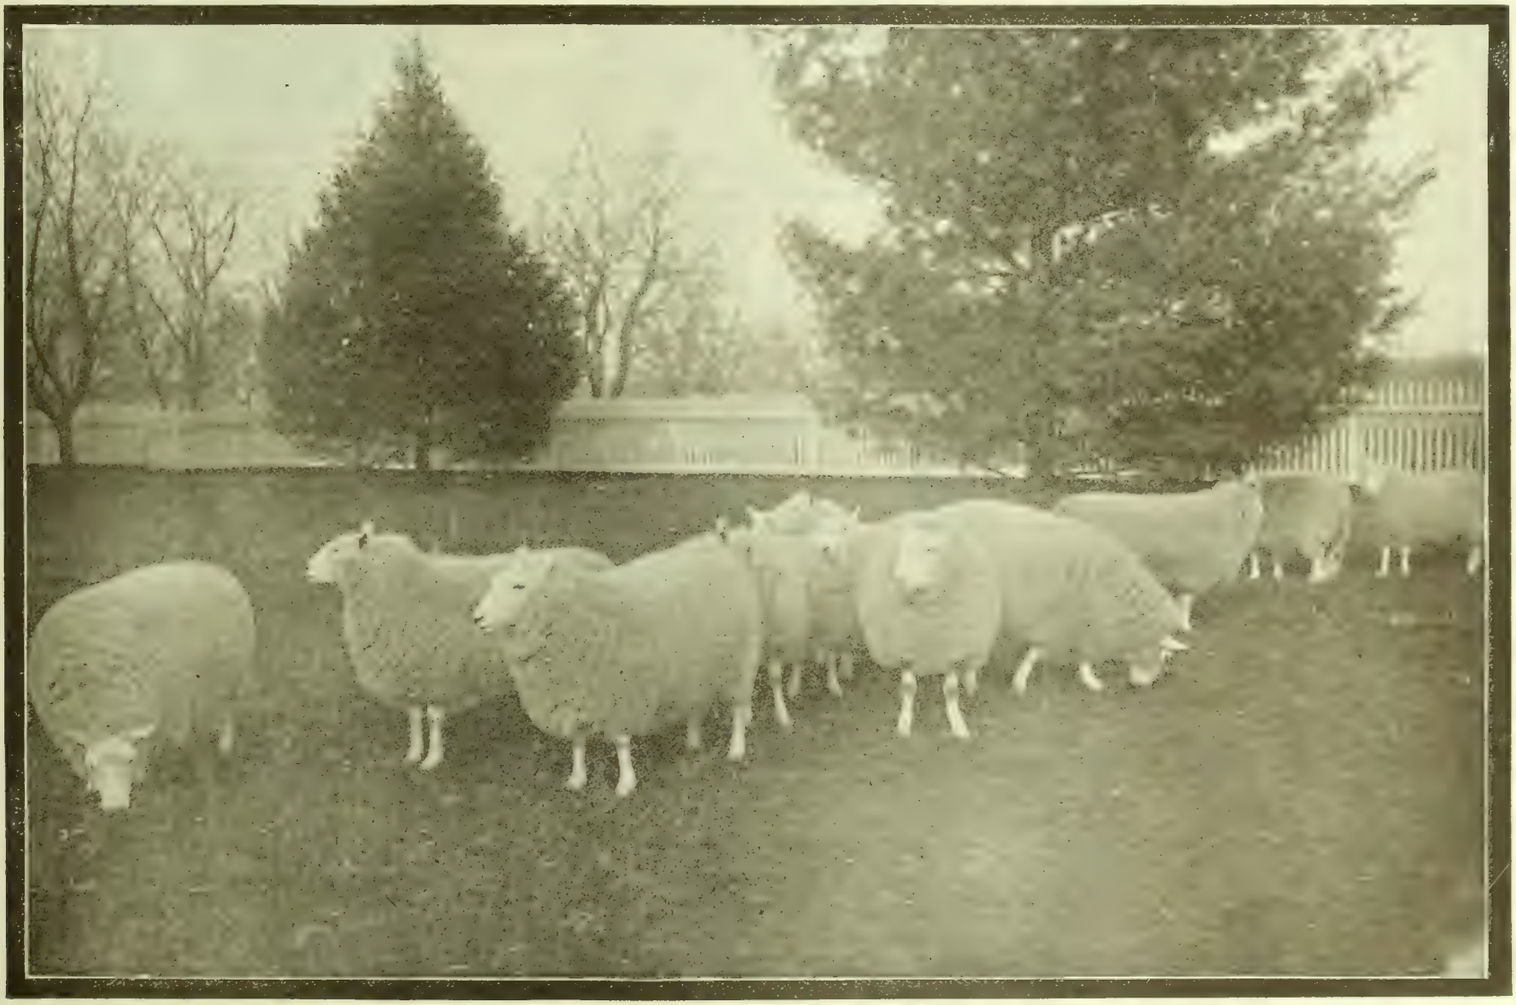
Our settlement consists of two roads, the Kintore road and the Kincardine road. We have five schools and three churches in the colony and we keep a minister all the time. We are all Presbyterians. The Presbytery of of St. John has been very good to us as a congregation and has given us much valuable assistance in maintaining our churches. In conclusion I would like to say that if our young men who go west would make up their minds to stay in New Brunswick and put the same energy into their work that they will have to do out West they would eventually reap more comfort and sociability. I do not deny that there are obstacles here but go where you will you will find drawbacks.

I believe a lot of Scotch emmigrants are coming to New Brunswick this spring and should this letter come to their notice they may take it as an invitation to come to see us in New Scotland where we will make them welcome and perhaps do them some good by giving them some of our advice and experience.

Now, after all, what do we live for? I hope not for money alone although we cannot get along without it but let us use it and not abuse it. According to the course of nature in a few short years we will follow those who have gone before and in giving up life's battles we feel that we have tried to do our part to make two blades of grass grow where one grew before. I never got one dollar outside of my own family although I could have borrowed money time and again for the asking, but I did not for the reason that some day it would need to be paid back again.

DONALD INNES.

Tobique River, N. B.



A THRIFTY FLOCK OF CHEVIOT SHEEP.

Agricultural Organizations in New Brunswick

For a correct understanding of the position of New Brunswick in regard to its agricultural organizattions it is necessary to relate the agricultural history of the province at some little length. This province was not at its earliest settlement nor has it been since considered as a distinctively agricultural province as have been Ontario and P. E. Island. Its enormous tree growth and the furnished so much profitable occupation and revenue that its small population has been largely engaged in fishing and lumbering and pursuing agriculture only generally as a side line.

The people coming to New Brunswick have not been as a rule people trained in agriculture and though they were located amid great agricultural possibilities have but in few instances exploited or developed their opportunities.

In pioneer days there were a few families who distinguished themselves as farmers but they did not seem to have found it necessary or perhaps possible to co-operate to advance their business.

The first agricultural society organized in N. B. was in the city of St. John under the patronage of Governor Carleton in 1790. In 1819 the Charlotte Agricultural Society was formed at St. Andrews and it continued to exist until about ten years ago, when it was superceded by a Farmers Institute.

Shortly after this a society was formed in Fredericton, known as the "Central Society for promoting the rural economy of the province." In 1825 another society was formed at Fredericton called "the Agricultural and Emigrant Society." This latter society took the place of the original institution and the funds of the former were handed over to it. There also appear to have been societies formed elsewhere in the province under the names of "Agricultural and Emigrant Societies." In 1826-27 some £700 was handed over to the Fredericton society by the government and the money was used to import pure bred stock from Great Britain said to be the first importation of stock from Britain made by any British North American Colony. These cattle were undoubtedly Shorthorns as known in England at that the splendid, large, heavy-milking cattle of this country which some men living today can well remember.

Just how long this society at Fredicton existed does not appear from any information at the disposal of the writer, but it was not until some time in the forties when agriculture was very much depressed that a new move was made.

In 1849 Prof. J. F. W. Johnson of England was invited by the Legislature of the Province to visit and make a report upon its resources. This report, admirable and comprehensive as it was, does not seem to have been immediately productive of agricultural development. A central agricultural society was, however, organized for the province, in 1850, and, undoubtedly, did some good work. It held the first provincial exhibition in 1852, an exhibition which seems to have been the first real demonstration of the agricultural capabilities of the province, a demonstration which surprised the people themselves. Visitors from abroad stated at the time that the exhibits of field crops, etc. were superior to those they had seen at exhibitions in the Canadas, the United States or in Scotland. The Central society sent speakers around to encourage the starting of societies in the various counties of the province, many of which lived, did good work and have continued, forming the foundation of societies now existing.

By 1855, the Central society seems to have ceased to exist. On December 13th, 1856, a commission was granted to Dr. James Robb, Geo. Kerr, Charles Perley, Geo. L. Hatheway and Hugh McMonagle to investigate the agricultural conditions of the province with a view to the public encouragement of agriculture. This Commission strongly recommended the establishment of a Provincial Farm where should be demonstrated the best farm methods and where improved stock and seeds should be raised and sold to farmers of the province. They also recommended the establishment of a Board of Agriculture. These recommendations were not immediately adopted. However, in 1859 a Provincial Board of Agriculture was created of which George Kerr was the first chairman and Dr. Robb the first secretary.

Thirty local agricultural societies the first year made returns to the Board. This Board which was elective from various stated districts of the province administered agricultural affairs until 1875. During the latter years of its existence it was the subject of criticism regarding its financial management especially of exhibitions and at the session of 1875 an Agricultural Act was passed vesting the administration of agriculture in the Executive Government through a secretary for agriculture. At this time there were 48 local agricultural societies receiving government grants totalling $11,014.

In the winter of 1875 there was held by invitation of Nathaniel Hubbard, Burton, Sunbury Co., a meeting at his residence attended by the leading farmers of that county. Various agricultural matters were discussed as well as a proposal to call a general meeting of the farmers of the province for organization.

In 1876 the late Hon. W. D. Perley then of Maugerville, issued a call for a provincial convention to be held at the Burton Court House in Sunbury much enthusiasm as there was a general feeling that the Government by abloishing the Board of Agriculture had prevented the farmers of the province having that oversight and influence in agricultural administration which in their opinion was desirable.

An association was organized at this meeting known as the Provincial Farmers' League, an association which lives today through continuous annual meetings and now known as the Farmers' and Dairymen's Association of New Brunswick. This association at first concerned itself considerably with the administration of agricultural affairs and no doubt its influence largely resulted in the Agricultural Act of 1880 which created once again a Provincial Board of Agriculture.

This Board continued in existence the members being elected by the various agricultural societies, until 1888, when after it had started upon the investigation of the accounts of the famous $30.000, Horse Importation it was summarily legislated out of existence and the agricultural administration placed under a member of the Government who at the time was also Provincial Secretary. By this Act of 1888 the Province was divided into agricultural districts in each of which it was designed there should be an agricultural society. By regulations then prescribed it was permissive for agricultural societies to send delegates to the Provincial Farmers' and Dairymen's Association annual meetings and to pay their expenses.

In 1892 an appropriation was made for the encouragement of dairying by the Legislature and by the suggestion of Prof. J. W. Robertson, Dominion Dairy Commissioner, delegates were sent out to give practical dairy instruction and to organize Local Dairy Associations. A considerable number of these associations were formed and it was made compulsory upon these associations, if they were to receive the government grant of $25 per year that they should send delegates to the Provincial Farmers and Dairymen's Association meetings. While this legislation was in force these provincial meetings were largely attended and the Local Dairy Associations' work resulted in the starting of many creameries and cheese factories.

In 1897 the Department of Agriculture was created, the Commissionership of Agriculture was made a separate portfolio in the Government and the office of Deputy Commissioner was created.

Up to this time various agricultural meetings throughout the province had been held under the management of the Farmers' and Dairtmen's Association, but after the Department was created this work was taken over by it. About 1501 the local dairy associations failed to receive the countenance of the Department, a Farmers' Institute System was adopted, the Deputy Commissioner being made Supt. of Institutes and later also taking over the Secretaryship of the Farmers' and Dairymen's Association and the small grant annually going to that association discontinued. The result was a great lack of interest in the association, it was apparently felt that its affairs were entirely in the hands of the Department and the fact that its officers, as nominated by committee, were largely of the political party supporting the then administration, led to the withdrawal of many men of independent turn of mind from its meetings.

The Association at this time failed to represent the farmers as a body and its meetings dwindled to a very small attendance.

With the change of Government in 1908 came a change of policy in regard to the Farmers' and Dairymen's Association and the new Commissioner requested the association to elect all of their own officers independent of officials of the Department. The result has been a very different spirit among the members of the association and the attendance at the meetings has regained almost its old time size.

When the Farmers' Institute system was adopted in the Province each Agricultural Society was asked to take up the Institute work and in some places where societies did not exist Institute organizations were formed, each of which received an annual grant of $15 from the government. Three of these Institutes still exist the others have organized themselves into agricultural societies.

Since 1908, 30 new agricultural societies have been organized whereas there were 60 societies then, there are now 90 and the appropriation for grants to these societies has been increased from $8,000 per year, then to $13,000 in 1910.

A Provincial Fruit Growers' Association was organized in Decem. ber 1904, and has since been holding annual meetings and fruit displays in connection therewith. It has also held various local meetings and while it has not extended its field of operations over much territory has done good work in the St. John Valley.

Such then is the history of the agricultural organizations of New Brunswick with the exception of the co-operative cheese and butter manufacturing associations which were more of a trade organization and which unfortunately have not survived the conditions which they met.

At the present time therefore we have evolved from our history and experience,—

1. The Farmers' and Dairymen's Association of New Brunswick with a record of 35 consective annual meetings. It is today an independent and voluntary association of farmers, representative of them. It grapples with questions of provincial importance to agriculture and rural life and makes suggestions to the Governments in regard to many matters. It does not receive any Government aid except that in its educational work the Department pays the expenses of halls, speakers, etc., as may be mutually agreed upon. It is made up largely of delegates from the local agricultural societies which send them and pay their expenses in attending its annual meetings. It has a wide field of usefulness before it being the one general organization of provincial farmers through which they can can speak to Governments, Railways and other Corporations. It may also be of great educational value if it so desires, extending its meetings to become short courses of instruction in various lines, and it can reach out and co-operate with the school teachers, the country clergy and all who come in contact with rural conditions.

2. The New Brunswick Fruit Growers Association. This organization also has a great future. New Brunswick is pre-eminently a natural apple growing country and the successes which have been attained in Nova Scotia and the west coast may be repeated and excelled uon a much larger scale throughout the length and breadth of this province. To enthuse the people of New Brunswick with their magnificent fruit growing possibilities and to attract millions of capital to develop the industry, to build up a great fruit fruit export trade and make the name New Brunswick noted everywhere the choicest apples and pears are eaten is a prospective work large enough and promising enough to give this association ample scope and stimulus.

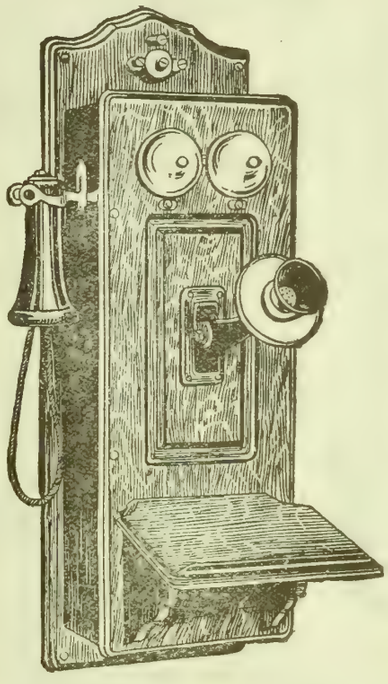
3. The Local Agricultural Societies. These associations have an almost unlimited scope for usefulness under the charters and regulations that govern them. The fullest measure of home rule consistent with systematic work is given them. Any work for the improvement of stock of seeds of farm methods and machinery, all kinds of competitions, exhibitions and educational work are allowed them. They receive substantial financial assistance from the Province and form a basis of organization for their members which may be developed in so many ways that no progressive farmer can afford to ignore them or the benefits they extend to him. The policy of the Department is to help those societies most, which most largely help themselves and if the members of these societies will but work together unselfishly for the common good there is scarcely a limit to what they may accomplish for the rural life and progress of the Province.

The time is no doubt coming, and coming soon when special departments of farm work outside of fruit growing will find it desirable to organize upon a provincial scale. Already we have small poultry associations organized for the holding of exhibitions. A provincial organization for this branch looks advisable. Seed growers, Bee Keepers and other Seed Growers, Bee Keepers and other coming together and the Department of Agriculture will be found ready to do its part in assisting such efforts in every way that a Government properly can.

W. W. HUBBARD.
Secretary for Agriculture, Fredericton. N. B.

Telephone Quality !

WHAT IT MEANS



WALL TELEPHONE, MAGNETO TYPE

"The best way is always the cheapest," is an old saying, but nevertheless is true. In no line does it apply, however, with such force as it does in regard to a telephone.

A dollar or two is the difference between a good telephone, that combines all the latest and best in the telephone art, with first class material and the highest class of workmanship, and the inferior telephone that is not up-to-date, and is made of second class material, or worse yet, of "made-over" parts.

The low priced telephone starts to go out of order and in one week it will cost you two or three dollars in time and trouble to make the necessary trips to put it right. Think what this amounts to in a year where you have 10, 20 or 50 such telephones on your line.

Quality Sells the Goods

The force of the above telephone reasoning was recognized by us when we started to manufacture telephones and we spared neither time nor money to get the highest standard of quality. Our success has shown that we were right. We have, during the past three years, vastly increased the number of our customers. The record of our telephones on one line made customers for us on a neighboring line. In other instances, companies using another make, gave us a trial order and after practical use, adopted our telephones. We have already the assurance that enables us to say that this Spring will see scores of companies leave the telephones they have been using and equip their new lines with Canadian Independent telephones. Thus quality wins out and our business is maintained on the only permanent basis.

Get Our Bulletins

If old operators are coming over to us, any new companies should consider well before deciding on the telephones they will use. Do not buy without writing us. If you want any telephone information, write us and ask for our No. 2 Bulletin.

Construction Supplies

We carry a full stock of construction supplies, and can fill all orders promptly. It will pay you to let us quote you prices.

PROMPT SHIPMENTS AND GUARANTEED SATISFACTION ARE MAKING OUR SUCCESS.

GOOD REPORTS

Home Mixed Stock Food a Success

A short time ago we published in this column a formula for preparing Stock Food at home from Barnes English Compound and fresh nutritious grains.

We have received so many words of praise for this formula that we are reprinting it for the benefit of those who may have chanced to miss it.

The advantage of making your stock food at home, using only the pure medicines and fresh grains, and avoiding harmful drugs and worthless fillers, is certainly of great importance to every farmer and stockman.

The formula is as follows: Mix three pounds of Linseed Meal and six pounds Cornmeal with one pound Barnes English Compound, it will make ten pounds purest and strongest stock food that can be made. S. G. Amsden, Windsor, Ont., will send one pound package postpaid on receipt of 50 cents, money order or stamps.

Irish Cobbler, Triumph, Green Mountain and Delaware

Choice SEED POTATOES

Now on hand.

Send your order in early.

Buchanan's Swivel Carrier and Harpoon Steel Fork

The principle is right—the materials are right—and the making is right. This carrier has no wires or steel springs—because springs weaken, wear out and cause trouble.

Our new Steel Track Carrier is made of malleable iron. The track is double angle steel, supported at every pair of rafters with patent clamp and collar tie.

With our Swivel Carrier and Harpoon Fork or Sheaf Lifter in your barn—you can harvest your crops in one-third the time and save the wages of two or three hired men, besides getting more hay, grain, etc., in your barn.

We also make Carriers for Wood Track and Rod and Cable. Since 1875, we have been perfecting Pitching Machines and Haying Tools. Today, we can offer you, the best beyond question, in Canada. Write for catalogue. 3

M. T. BUCHANAN & CO., INGERSOLL, ONT.

Preparation for Spring Seeding.

Editor Maritime Farmer:—

Now that spring is close at hand, all agriculturists are turning their minds towards the various problems of out-of-door spring work, which might be classified under two headings; viz: tillage and preparation of grain. Proceedure in tillage depends on the character of the soil, drainage, fall plowing or spring plowing, weeds, and the crop for which it is intended. Should the land be wet, intended. Should the land be wet, cold and late, owing to lack of drainage under drain this soil as soon as you possibly can. It will pay for itself inside of three years in the crops received, to say nothing of saving of machinery and ecomony of labor. On land which is weedy, we plan to harrow in the spring as soon as possible, performing this operation weekly, until the crop is planted. Thus we free the soil of weeds by germinating seeds in the upper four inches of surface of soil and killing them with the harrow. In our four year rotation, we apply the manure but once, viz. to the root crop. This is spread in the spring and either disced or gang-plowed under. If, however, the soil is very poor, the same treatment might be given the second year for grain.

Another question which presents itself is that of early seeding. Should the land be free from weeds, plan to get the crop in as soon as weather permits. This almost invariably induces greater yield of crops with wheat, oats and barley, seeded in that order. We attribute this to the following reasons: Early cultivation means, the conservation of the moisture accumulated in the soil during the winter. Various experiments have proven that the difference of one week in seeding oats after the ground was fit resulted in a loss of 6 to 9 bushels of grain per acre from delay. It also induces the drying out of the surface for seeding and the killing of weeds. Invariably we find a much heavier root system, hence greater drought resistance, earlier maturity, more uniformity in ripening and better weather conditions for harvesting. Should our grain show somewhat yellow after coming up from early seeding in a wet spring, we often use 150 pounds Nitrate of Soda per acre to correct this lack of free nitrogen in the soil and force the crop along as much as possible. All these points are largely influenced by the amount of water in the soil and a thorough knowledge of under drainage will aid us in regulating methods of tillage and earliness of seeding.

As to the preparation of grains for spring seeding, I would lay greatest emphasis on the cleaning and grading of the same. This can easily be done with a first class grain grader and fanner; the "Perfaction" mill, put out by the Templin Manufacturing Co., of Fergus, Ontario, is considered by good authorities to be the best on the market. This machine not only takes out chaff, dirt and weed seeds, but

DR. J. WOODBURY'S HORSE LINIMENT

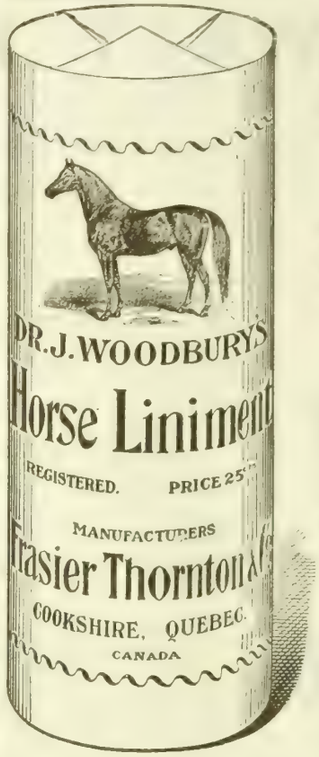
INFALLIBLY THE REMEDY

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.

Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.



Bear River, N. S.

Dear Sirs:—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly,

CLARKE BROS.

Hubbard's Cove, N. S.

Dear Sirs:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly,

C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE,
Owner "All Right," 5817.

Elmsdale, N. S.

Dear Sirs:—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.

Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs:—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse.

Yours truly, H. R. WHITEHEAD.

Dear Sirs:—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends. E. J. ANDERSON, Truro, N.S.

Any irregularity of the bowels is always dangerous to your health and should be corrected at once for if this is not done constipation and all sorts of diseases are liable to attack you.

Milburn's Laxa-Liver Pills cure Constipation and all Stomach, Liver and Bowel complaints.

Mr. Henry Pearce, 49 Standish Ave., Owen Sound, Ont., writes:—"Having been troubled for years with constipation, and trying various so-called remedies which did me no good whatever, I was persuaded to try Milburn's Laxa-Liver Pills. I have found them most beneficial; they are, indeed, a splendid pill, and I can heartily recommend them to all those who suffer from constipation."

Price 25 cents a vial or 5 for $1.00 at all dealers, or sent direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

LOGICAL ECZEMA CURE ENDORSED BY PHYSICIANS.

Dr. R. A. Folkerts, of Duluth, Minn., tells of his success in treating patients with D. D. D. Prescription:

"There was a man here suffering from eczema for the last fourteen years, and I applied the D. D. D. treatment. I also applied it to a man of West Duluth, Minn., whoihas been suffering with Eczema in his feet, and the second treatment in both cases cleared the skin almost absolutely. The first application is a balm, and its soothing effect is beyond expression. I shall never be without it, and shall use it among my patients altogether."

No matter how terribly you suffer from eczema, salt rheum, ringworm, etc., you will feel instantly soothed and the itch allayed at once when a few drops of this compound of oil of wintergreen, thymol, glycerine, etc., is applied. The cures all seem to be permanent.

For free trial bottle of D. D. D. Prescription write to the D. D. D. Laboratory, Department F. M., 23 Jordan St., Toronto.

For sale by all druggists.

separates the grain into three distinct grades, viz., large heavy grains, small heavy grains, and light grain. The first grade is the only one which any farmer can afford to sow. This invariably gives greatest yield of the most uniform grain. Experiments in various parts of Canada and the States has proven definitely that the difference in yield under average conditions between grades 1 and 2 will be from 5 to 7 bushels per acre in favor of the former. Then again, many farmers are changing their varieties of grain about every third year. This is due to several causes. 1st, there is an idea that a change of seed every third year is necessary to produce the best results. This is erroneous, for I can point out scores of farmers in the Maritime Provinces who, with a good fanning mill, have produced their own seed for 12 years and over, and the variety has improved with them. Another reason is that many farmers do not realize what variety is most suitable to their conditions or are still dubious as to whether the black or the white oat is superior for feeding. Whether the variety be black or white, we demand in oats greatest yield, thinness of hull in order to give a high percentage of kernel (oatmeal), quality and quantity of straw. Choose a good variety with these characteristics and improve the same by proper selection. To farmers who are buying seed, I would advise purchasing the same from a member of the Canadian Seed Growers' Association. The pedigree stands for just as much in grain as it does in live stock, as the laws of heredity are just as strong in one case as in the other. Should there be any trouble with smut in the crop of last year, treat seed for the coming season with either formalin or blue stone.

Just a word as to rates of seeding and I am done. In a series of experiments conducted at the Agricultural College, Truro, N. S., in 1909, it was found that even in a year of poor stooling of grain seeding at the rate of from 2 to 2½ bushels per acre gave the highest results. This but agrees with similar experiments conducted for many year in succession at the Ontario Agricultural College, Guelph, and like institutions. But not only is it more economical in the seed bill and more productive in harvest, but it regulates, to a large extent, the strength of the clover crop seeded down with the grain. This to the stockmen, who is, after all, the best farmer, is of far greater importance than the difference of a few bushels per acre in his oat crop. Consider that a good catch of clover means in the first year about three tons per acre of feed far more valuable than the same quantity of timothy or any of the grasses. At the same time, it leaves in the soil fertilizer equivalent to 7 or 8 tons of barnyard manure per acre. A failure to produce a good catch of clover might be attributed to the following causes: Poor seed, poor tillage, inadequate drainage, weeds, absence of nodule forming bacteria and the too heavy seeding of the nurse crop oats, barley or wheat,) which shades and partly smothers the tender clover plants.

Could we but regulate all the above influences, it would increase the production of our lands throughout the Maritime Provinces to a very large extent.

The "Bissell"

is the lightest-draft harrow

Because of its astonishingly light draft time after time the "Bissell" Disk Harrow, in field competition, has done DOUBLE the work its competitors have accomplished under same conditions. The special shape of the "Bissell" Plates allow them to enter the ground easier and turn the soil with less effort. Steel blades, meeting the plates "Chisel fashion," keep the plates thoroughly clean. The space between the plates is kept clear of trash by movable clod irons—the only Harrow that has this feature. Sand bands protect the ball bearings from dust. The seat is placed back of the Harrow. In this way the weight of the driver rests over the frame, and neck weight is removed The hitch is well back which is still another draft —reducing feature. Search the continent over and you'll not find a Harrow of such light draft and correct proportions as the "Bissell." For further particulars write Dept. M. for catalogue or see your local dealer.

Roses and Baby Ramblers.

Mrs. A. C. L., Grand Falls, writes:—"Please tell me through the Maritime Farmer whether roses can be grafted or not. If so, at what time of year; and how?

My Tea Roses and Baby Ramblers, that have been kept in the house all winter, have the under side of the leaves covered with tiny lice, some of which are a faint pink color, and others, larger, have darker spots on the back. The leaves turn yellow and drop off. The leaves also seem to be covered with a fine web. Will these lice kill the roses? What will kill the lice?

Please give directions for cultivating water lily (Nymphoea Odorata). Would May first be too early to plant the roots in this climate?

Will Tea Roses and Baby Ramblers, that have bloomed in the house this winter, bloom again this summer if set in the garden.

Ans.—Roses can be grafted like apple trees, but it is not usually done, and, in fact, its success is so problematical in this climate, that it is hardly worth giving directions. The process commonly used is that of budding, and is done as follows: A good thrifty cane is selected and an incision made about six inches from the ground, one cut being across the stem about half way around; another about an inch long straight down from the centre of the first. With a dull knife lift the bark each side of the perpendicular cut making a V shaped wound with the square part at the top. Then from the rose you wish propagated take a bud from the axis of a leaf stalk, (breaking the stalk from the stem of course) and trimming the edges to fit your incision, place it smoothly therein, taking care that this sap wood on each will fit smoothly together. Place the flaps of bark back over the inserted wood just leaving the point of the bud out. Warp together above and below the bud with rubber tape or surgeon's plaster, leaving the tip of the bud uncovered. Grafting wax and strips of cloth or tough paper are commonly used by growers, but the above is an excellent substitute for the amateur. As soon as the bud begins to grow, cut off the parent stem, just close above the bud and wax it over or cover with the material named above. Three weeks should tell the story whether your buds will take or not.

The Baby Ramblers and Tea Roses are infested with the common Red Spider and can be cleaned by the forcible application of water to the underside of the leaf. This must be done once a day, every sunny day, with a syringe or some instrument that will apply the water with considerable force. Do not spray roses during dark weather. By spraying every fine day for two weeks you should overcome this pest, but frequent spraying must be observed, until they go out of doors, or the insects will return.

To cultivate Nymphoeas in the yard provide half an oil cask, wash as free of oil as possible, dry thoroughly in the sun and put bottom about eight inches of rotted manure, then about six inches of black mud. Place the roots in this and keep about six inches of water constantly over them. In this winter, as soon as ice forms on the water, place the tub in the cellar.

To plant them in a natural pond, if the bottom is soft, tie a stone about the root with twine (not wire) and throw them to the location desired. They must be planted in a place that will never be entirely uncovered with water, yet where the normal depth will not be over two feet.

Roses that have been forced in the house must be partially dried off and rested for, not over two months. To flower in the summer roses must have their preoid of rest. H. E. G.

Results of Experiments in Different Methods of Milking.

In a late bulletin of the Virginia station on "The Production of Clean and Sanitary Milk," some very comprehensive experiments were made to determine the source of bacteria in the station barn and the relative merits of the precautions taken to avoid contamination.

There were five cows milked over a period of six days, under the following conditions:

The cows and the stables were thoroughly cleaned and all places from which dust might be distributed were sprinkled, except the bedding. The first cow was milked into an open pail with flanks and udder moist, and a sample taken. The bedding was then thoroughly moistened, and the next cow milked with other conditions the same except the moistening of the bedding. The next cow was milked without moistening the flanks and udder, all other conditions being the same as No. 2. The next sample was taken with bed and flank moist, and a pail having an opening about six inches in diameter, which was covered with sterile cheesecloth. The next sample was taken the same as No. 4, except the first four strippings from each teat were discarded.

The average bacteria per c. c. for the first cow was 2,406; for the next 1,121; for the third cow, 1,452; for the fourth cow, 844; for the fifth, 730, the lowest.

It is interesting to note the results where open pails were used, as against the narrow mouthed or closed pail; the former showing, considerably a larger number of bacteria.

The open pail is easier to milk into for the careless or indifferent milker but that is not the sort of milker who is profitable to have in your stable.

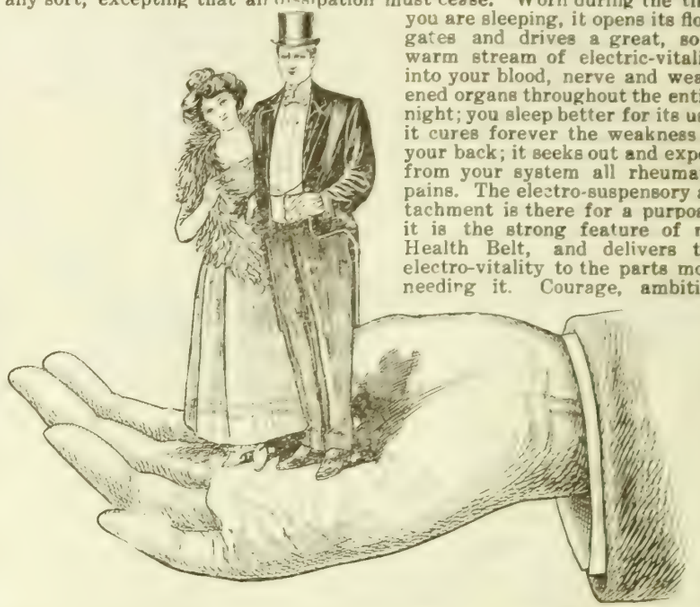
I Present to You a "Health Belt Man"

He is 55 Years "Young."

Yes, 55 years young; not 55 old for My Health Belt poured vitality into his blood, nerves and tissue until

HIS VIGOR WAS RESTORED

My marvelous HEALTH BELT is a Wizard Worker, a mechanical self-treatment of the highest therapeutic value. It stands by you and never abandons its task until you are brought back to a state of vigorous Manhood, without an ache, pain or weakness. No drugs, no dieting, no restrictions of any sort, excepting that all dissipation must cease. Worn during the time you are sleeping, it opens its flood gates and drives a great, soft, warm stream of electric-vitality into your blood, nerve and weakened organs throughout the entire night; you sleep better for its use; it cures forever the weakness in your back; it seeks out and expels from your system all rheumatic pains. The electro-suspensory attachment is there for a purpose; it is the strong feature of my Health Belt, and delivers the electro-vitality to the parts most needing it. Courage, ambition



and a new view of life, with full self-confidence, surely result. It makes you young and keeps you young, with the fire and vigor of the biggest, fullest blooded man you ever saw. The "HEALTH BELT MAN" cannot grow old, for he knows the secret of perpetual youth. It will place you in the "feeling fine class." "I am a man again, thanks to your wonder-working Health Belt. Use my name as you see fit." So writes C. L. Snell, of Middleport, N. Y. So have said thousands before him.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all the risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

These Wonder Books are

FREE

Call or write for them to day

Fill in the coupon and let me get these wonder Health Books into your hands. They are sent free, sealed, by mail, and give certain health and nature facts which every man (young, middle aged or old) should have. They fully describe my Health Belt, and are beautifully illustrated. I have known 100,000 men who sought my aid—I should know you.

Note the Safe-Lock Construction of PRESTON SAFE-LOCK SHINGLES

Safe-Locked on All Four Sides

Don't make the mistake of thinking that all makes of metal shingles are very much alike. There is a vast difference between PRESTON Safe-Lock Shingles and others.

Unlike other Shingles, PRESTON Shingles do not merely slip or slide together. Instead, they are SAFE-LOCKED on all FOUR sides. The picture above shows how.

Look at ARROW A. See how the sides of the shingles hook over each other. This is on the principle of the "sailor's grip." It is utterly impossible for shingles locked in this way to pull apart. The heavier the strain, the firmer the grip.

Twice as Strong

The top lock of PRESTON Shingles is TWICE as strong as our wonderfully secure side lock. It consists of three thicknesses of sheet steel—see ARROW B.

The top of the shingle is where the greatest strain falls. Yet the top lock of most other metal shingles isn't as strong as the side lock of ours.

ARROW C shows how the shingles above hook over and lock securely to row below.

Nailing Is Protected.

ARROW D shows the method of nailing together the top locks of two adjoining shingles. The top lock of the right hand shingle overlaps the one on the left. The nail goes through both shingles.

All nails on the flange of the top-lock are covered by the shingles on the row above. Thus all nails are protected from exposure to the weather. They cannot rust or work loose. They are there for keeps.

So strong are our locks that there has not yet been a gale powerful enough to rip off a roof covered with PRESTON Safe-Lock Shingles. The terrific wind storm that swept over Ontario on April 8, 1909 ripped off scores of wooden, metal and prepared roofings. Yet not one of these metal roofs was a PRESTON Safe-Lock roof.

Gale-proof Shingles

So close do PRESTON shingles lay to the sheeting and so secure are the Safe-Locks that even if some of the shingles were not nailed the roof would be solid and wind-tight.

It is utterly impossible to get PRESTON Shingles off the roof in any other way than by removing the nails one by one and unlocking each shingle separately. When you put PRESTON Shingles on your roof they are on to stay.

Snow-proof, too

No snow can be driven up PRESTON side locks and on to the sheeting below. The fold of our top lock closes right down over the end of the side lock. No rain or snow can be forced past this fold of sheet steel, unless you drill a hole through it first.

Just how easy it is for snow or rain to be driven up the side joints of other shingles you can readily see for yourself.

Simply fasten the sides of two ordinary shingles together. Then hold the shingles up and look through the joint. You can see daylight through it. That means there is an unobstructed passage through which rain or snow can be driven by the force of the wind.

Make the same test with PRESTON Shingles. You cannot see daylight through our side locks. That means the ends of our side locks are closed securely against wind and weather.

Generous Folds

The folds of PRESTON Safe-Locks are of such generous size that there is room and to spare for expansion and contraction due to excessive heat and cold. Even the shrinking of the wood sheeting or the heavy strain due to the settling of the building is not sufficient to make any difference to our safe-locks, whereas other shingles will pull apart and leave spaces for leaks.

Patented Construction

You understand now why PRESTON Safe-Lock Shingles are so different in construction from other metal shingles. They will always be different and better, too. We were the originators of the interlocking Shingles. The patents we hold prevent others from making as good a shingle.

British Government Specifications

It is a well known fact that the British Government is the most particular buyer in the world. Ordinary metal shingles could not pass their Acid Test for galvanizing. This test is more severe on the galvanizing than twenty years of Canadian weather. Yet PRESTON shingles will easily pass this test.

PRESTON Shingles are made and galvanized according to British Government Specifications.

Twice the Service

Shingles galvanized according to these specifications are good for twice the service of shingles galvanized in the ordinary way.

Lightning Guarantee, Free

We have been making PRESTON Safe-Lock Shingles for eleven years. In all that time we have never heard of lightning damaging a building roofed with PRESTON Shingles.

So positive are we that a roof of PRESTON Shingles is lightning-proof that we give you a lightning guarantee free. This proves to you our unlimited confidence in the lightning-proof quality of PRESTON Shingles.

Most Quickly Laid.

As PRESTON Shingles are cut accurately to size, and the locks carefully made, they lock together quickly.

A man and a helper can lay 10 squares of PRESTON Safe-Lock Shingles in a day, whereas 5 or 6 squares would be a good average with ordinary metal shingles. If you have a large surface to roof that saving of time and labor means a good deal to you.

Booklet Reward

We have just issued a new booklet, "Truth About Roofing." We should charge something for this, as it contains information of real value to anyone who has a building to roof. But we will send it FREE as a reward to all who cut out, fill in and mail the coupon to us. Just you mail it today, or you'll forget it.

Grow Larger Crops Without Depleting Soil Fertility.

R. Robertson
Supt. Experimental Farm, Nappan, N. S.

Editor Maritime Farmer:—

That live stock is a postive essential to successful agriculture in the Maritime Provinces is the sincere belief of the writer. The successful growing of roughage crops necessary for their feed is postively of first importance,(i. e.: growing large enough crops per acre to leave a margin of profit on the market value of the crop over the actual cost of producing it). Personally, I am ready to admit that the margin of profit in live stock, no matter how necessary, is so small when all cost for feed, care, money invested, risk, etc., is honestly charged,as to leave verk little if any margin on the right side in a great many cases. Were it not for the fact that (to my mind at least) it is the best, if not the only practical way to keep the producing ability of our farms up to the standard required and at the same time produce a crop of some kind each year, it is just possible that I, like many others, would attempt to farm without live stock. But believing, as I do, that live stock is the corner stone of our successful agriculture, particularly in the Maritime Provinces, the raising of the fodder for our live stock is of the very greatest importance and this I am also prepared to admit is quite often done at a loss from carelessness in methods and following too closely some of the habits that may have been possible when the soil of the country was in its virgin state, but which from constant misuse, much of it is not in a state to return large enough yields per acre to leave any margin of profit.

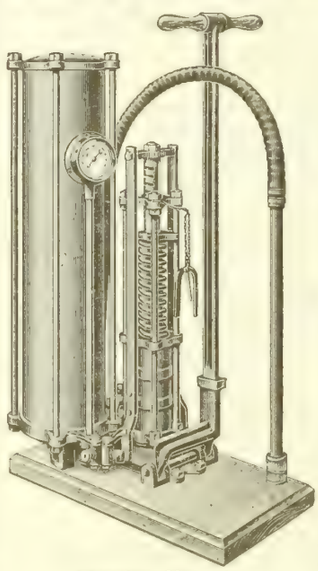
To my mind, a great deal more attention has to be given to what crops are to be grown, both with a view to growing the most suitable crops for stock food, and with a view to the getting of continuous valuable crops and at the same time keeping up the condition of the soil for the production of large crops. With this in view, clover, grown as often as possible in every rotation, is desirable both on account of its being one of our very best stock foods and from the fact that by the growing of this crop, the texture of the ground can be much improved while at the same time a valuable crop is produced.

The system which has been so far largely followed growing grain for a few years followed by timothy hay for as many more as it would give anything like a fair crop and often not large enough to pay for its actual cost, without allowing anything for deterioration in the producing state of the soil, can only end in one place, failure,. Believing this I would say, that were a carefully thought-out system of rotation of crops followed the produce of the country would well be increased 25 to 50 per cent. in but a few years.

Use the shortest rotation practicable for your local condition with one hoed crop, preferably turnips, in every rotation and using all the manure available and the necessary amount of cultivation and hoeing on this crop, and clover hay once, at least, in every rotation, cutting one crop only, at a time, with grain alternating always following either a hoed crop, or a clover crop the aftermath of which had been turned under. In preparing for this root, or hoed crop I would hope to have a clover sod, (not an old timothy or pure grain sod) plow it in the fall moderately shallow turning it well over, and possibly cultivating it once or twice. Cultivate well in the spring and spread the manure on the surface preferably with a manure spreader. Plow again somewhat deeper, and again cultivate thoroughly. Run into rows or drills from 26 to 28 inches apart, for either turnips or mangolds. Sow the turnips and mangolds in continuous rows. The planting of the seeds in bunches 1 foot apart, with from 3 to 6 seeds in each bunch is most desirable. This helps very much at thinning time, helps germination and enables you to select the very best plants and they will always be found in the right place, 1 foot apart. With the necessary amount of cultivating and hoeing, say three to four times through with the cultivator and twice with the hoe, you will not only do what is necessary to secure a paying crop of roots but you will incidentally be doing all the necessary preparation for the following grain crop, clean seed grain, but you will also have prepared the land for successful crops for the remainder of that rotation, which should never have a second crop of the same kind following each other. A 3 or 5 year rotation, is the most desirable, for successful agriculture in the Maritime Provinces, and that means prosperous times for all the people. Keep more live stock, pay greater attention to the growing of the foods, clover, roots especially turnips, and coarse grains, most suitable for their keep. Take care to have a short rotation in which there is always one hoed crop, and never twice the same crop in succession with an aftermath of clover turned under as often as possible. This, instead of getting the minimum crop return at the greatest cost to future fertility as is usually done, would result in maximum crops with increased fertility, which would enable us to grow paying crops. Prosperity does not come to the farmer from the amount of crops he raises, but from the amount of profit he has in the value of the crop over its cost and to have profit he must grow large crops, and keep on a-doing it.

R. ROBERTSON.
Nappan, N. S.

Magic Pump No. 9.



Magic No. 9.

The easiest running pump ever made. The wonder among spray pumps.

The pump for the orchard that is too large for a hand pump, and too small for a power pump.

The man who operates the Magic is working against **only half the pressure indicated on the gauge. The spring does the rest. One man can easily develop and maintain 125 pounds pressure.**

CHALLENGE POWER SPRAYER

Largest capacity and highest pressure of any outfit made. It will **spray 400 gallons an hour at 200 pounds pressure.**

LITTLE GIANT NO. 70

High Power - Large Capacity - Barrel Pump.

All pumps have porcelain lined cylinders, therefore are free from corrosion. No stuffing boxes. No leaking. No friction. All parts are very accessible. Built for **durabililty, efficiency and power.**

NIAGARA BRAND LIME-SULPHUR

will control **San Jose Scale, Oyster Shell Bark Louse, Blister Mite, Aphis, Bud Moth, Apple Scab, Canker, Leaf Curl and Potato Blight.**

It is not an **experiment.** It has become the **standard** of **spray value** everywhere. It is the **only absolutely reliable Lime-Sulphur spray, because it is made right.** It is a **permanent solution.** It is endorsed by all Experimental Stations and Agricultural Colleges. It is an **Insecticide** and **Fungicide. Always ready for use.** It is a **summer** and **winter spray.**

ARSENATE OF LEAD

will control **Codling Moth, Potato Bugs** and **all chewing insects.** It is preferable to Paris Green or any other poison. It **positively will not burn foliage. Rains will not wash it off. Mixes readily with water** and **stays mixed** with the **least amount of agitation.**

When **Niagara Sprays are used, clean and perfect fruit is assured.** This means **prices, profit and prosperity.** Write for our **Spray Book** and **prices.**

Niagara Sprays are also made by:

Niagara Brand Spray Co., Ltd., Burlington, Ont.

Niagara Sprayer Co., Middleport, N. Y.; Oregon Spray Co., Portland, Oregon; Bean Spray Pump Co., Cleveland, Ohio; Medford Spray Co., Medford, Oregon; Hood River Spray Mfg. Co., Hood River. Oregon.

Are They Afraid?

Twice this year we have publicly and widely made the following fair offer to manufacturers of common cream separators. We again repeat it.

If any maker of common cream separators will print the names and addresses of all persons who—for any reason whatever—exchanged Tubulars for his machine during 1909, we guarantee to print a list AT LEAST TEN TIMES AS LONG of those who discarded his class of machines for Tubulars during 1909.

No manufacturer has accepted this offer. Are they afraid? Is not their silence the best proof that Sharples Tubular Cream Separator sales exceed most, if not all, others combined—that Tubulars probably replace more common separators than any one maker of such machines sells? Could you ask any better reason for choosing the simple, sanitary, easy to clean Sharples Dairy Tubular—The World's best?

America's oldest separator concern. The manufacture of Tubulars is one of Canada's leading industries.

To oil the Dairy Tubular, pour a spoonful of oil into the gear case once or twice a week. Self oiling. No oil cups, tubes or holes.

Spraying.

There are four essentials in order to get good fruit, namely: cultivation, fertilization, pruning and spraying. The subject of spraying is receiving more attention each year and no orchardist can afford to neglect this important operation. Bordeaux mixture as a fungicide, with Paris Green or arsenate of Soda as an insecticide is universally used. Bordeaux mixture must be carefully prepared. To prepare 40 gallons of Bordeaux, take 4 pounds of Blue Vitriol and dissolve it in 20 gallons of water. Slake 4 or 6 pounds of stone lime in hot water and dilute to 20 gallons, Now pour these dilute solutions into the spray cask simultaneously if possible, or by using a pail, introduce first a pail of vitriol water then a pail of lime water until the two barrels are empty and the 40 gal. cask is full. Use a cheese cloth strainer when filling the spray cask. Keep the agitator in motion during the operation:

It is advisable when much spraying is to be done, to have the lime and vitriol prepared in a stock solution, this is done by dissolving say 20 lbs. of vitriol in 20 gal. of water in a cask and slaking 20 lbs. of lime in another cask in 20 gal. water, a gal. from either cask represents a pound of the ingredients used.

In order to do good work a proper pump with all the submerged parts of brass, must be used. The pump must be well packed, fitted with an indicator, 25 feet of 1-4 inch 6 ply hose, a 12 foot bamboo pole with single stem Mistral Jr. nozzle attached. The indicator is very useful to regulate the pressure. A pressure of 80 lbs. to the square inch is necessary to procure a fine spray which is necessary to procure an even distribution of the mixture.

Before beginning to spray add 1-2 pound of paris green or 1 quart of arsenate of soda to the 40 gals.

If paris green is used as an insecticide the mixture must be agitated before beginning to spray as the paris green settles down if undisturbed.

If the best results are anticipated four applications during the season are required.

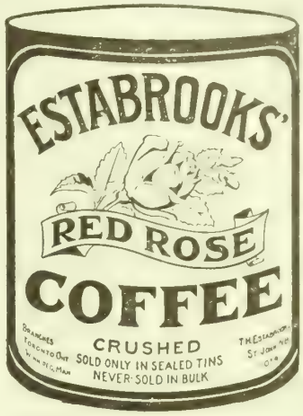
First, just as the buds begin to show green. Second, before the blossoms open. Third after the petals have fallen, and fourth, ten or 15 days later No fixed rule can be given, the orchardist must watch the trees and spray whenever circumstances demand Timeliness is very important. If the tiny apples are covered with bordeaux the spores of black spot cannot take effect. The spores of funguous diseases are in profusion on the trees ready to become active when weather conditions are favorable. Canker worms do their work when very small on the tender shoots. The worms and insects avoid the poison. The spray must be forced where the pests are in order to be effective, and many a man has been disappointed in the results of his spraying either because he was too late with the mixture or careless in the application. Both sides of the leaves require an application One thorough spraying which covers all parts of the tree is worth half a dozen careless applications, when the operator merely sprinkles the leaves.

Never neglect a single spraying even if the season seems favorable to the growth of clean fruit. We never can tell what will happen, and it does not pay to run any risks in this important matter. I have always used 4 pounds of blue vitriol to 40 gallons and very often 8 pounds of lime instead of 4. Lime never injures the bordeaux. The results have been most satisfactory. My fruit is always eagerly sought after by the speculators

Because spraying has been so much talked about during the past few years, I am afraid some few men are making the mistake of thinking that nothing

The new Crushed Coffee as compared with Ground Coffee

Merely to look at it you will see how very different it is; **Crushed** Coffee being in small even grains, totally free of chaff or skin while ground coffee has the appearance of being mashed; large and small grains with chaff or skin mixed together.



Red Rose **crushed** Coffee, being free of the chaff, can be made as easily as Red Rose Tea. Settles clear and bright. No egg or anything required. Just look at our **crushed** Coffee and see how correctly we describe it.

A good combination is Estabrooks' Coffee for breakfast and Red Rose Tea for other meals

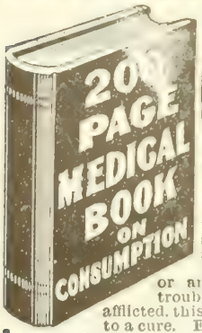
Consumption Book FREE



This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1582 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

else is necessary to get a good crop, but unless the trees are carefully pruney, the land well cultivated until July 1 and sowed to vetches or clover, and a liberal application of stable manure, or a well balanced commercial fertilizer added early in the season, the results will not be satisfactory.

W. H. WOODWORTH,
Berwick, N. S

NOTE:—Mr. Woodworth's plan of diluting the chemicals to the full extent before uniting them shows the care he takes in preparing his mixture, and is all right. Many successful orchardists, however, claim satisfactory results when one of the constituents is first placed in the cask which is then nearly filled with water, the remaining ingredients being added diluted only to the extent of one or two pails.—This at least has the virtue of being rather less trouble.

A Wonderful Producer.

A Holstein cow owned by the Dairy Department of the University of Missouri in one year produced more human food in her milk than is contained in the complete carcasses of four steers weighing 1250 pounds each. This statement, impossible as it seems, is not only true; but does not even do full justice to the cow. The solids in the milk which are completely digested and used by the body are counted against the entire carcass of the steer which is only in part edible.

The cow that performed this feat of producing the equivalent of four steers is Princess Carlotta. In the year she produced 18,405 pounds of proteids, fat, sugar and ash containing milk. Below is given the amount proteids, fat, sugar and ash contained in this milk and the amount of the same substances found by Dr. P. F. Trowbridge in an analysis made of the carcass of a fat steer weighing 1250 pounds.

	18,405 lbs. milk	1250-lb. steer
Proteid	552 lbs.	172 lbs.
Fat	618 lbs.	333 lbs.
Sugar	920 lbs.	..... lbs.
Ash	128 lbs.	43 lbs.
Total	2218 lbs.	548 lbs.

The total amount of dry matter in the milk was 2218 pounds all of which is edible and digestible.

The steer, with a live weight of 1250 pounds, contained 56 per cent of water in the carcass leaving a total of 548 pounds of dry matter. In this dry matter of the steer is included hair, and hide, bones and tendons, organs of digestion and respiration; in fact, the entire animal, a considable portion of which is not edible. The analysis of the steer's carcass was made from samples taken after grinding up together one-half of the complete carcass and is not in any sense an estimation of the composition of the carcass.

Princess Carlotta produced proteids sufficient for more than three steers; nearly fat enough for two; ash enough to build the skeleton of three, and in addition, produced 920 pounds of milk sugar worth as much per pound for food as ordinary sugar.

These figures show the remarkable efficiency of the cow as a producer of human food. It is because of this economical use of food that the dairy cow and not the steer is kept on high-priced lands. When land is cheap and feed abundant the meat producing animals predominate, but when the land become high in value and feed expensive the farmer turns to the dairy cow.

C. H. ECKLES,
Professor Dairy Husbandry,
University of Missouri.

Empire Fertilizer Drills.

The question has often been asked: "What should a farmer expect of a Grain Drill?" Let us tell you what we would expect.

We have a perfect right to expect a Grain Drill that will correctly sow any seed we want to plant, and Fertilizer Feed that successfully handles all brands of commercial fertilizers in wide range of quantities. We have a right to expect a well made drill, free from a lot of fads, and so simple as to be readily understood. It should have furrow openers—Disk or Shoes—that open proper seed trenches and place the seed in the ground at an even depth without skips or bunching the seeds.

The Empire Drill has been on the market for more than half a century. If it was not right, the company that makes it would have been out of business long ago. There are many Empire Drills in use to-day that were purchased fifteen to thirty years ago, and their owners tell us that they are doing just as perfect work to-day as when new, and that they have not been forced to spend a fortune for repairs in order to keep them running.

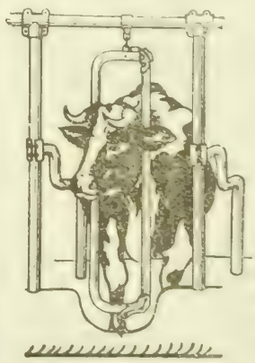
We want you to examine this Empire Drill for yourself. You are the judge as to whether or not it is what you want. Compare it with other drills, and we are sure you will give us your order.

Bligh & Prince, Agricultural Implements and Carriage Dealers, Truro, N. S.

Exclusive Agents in Nova Scotia for Empire Grain and Fertilizer Drills.

Are You Building a New Barn or Remodeling Your Old One?

If so write to-day for a copy of our new catalogue on Steel Stalls, Stanchions and Stable Plans. It is just off the press and contains the very latest ideas and suggestions from the Ontario Milk Commission Report, Agricultural Colleges and prominent dairymen. You cannot afford to miss this chance.



"BT" Steel Stalls and Stanchions will keep your cows clean and comfortable and your stable will be bright and sanitary They cost less and will last longer than any other kind of stabling.

Our Stanchions are made in five different sizes, ranging from five to nine inches in width.

Litter Carriers, Hay Carriers, etc.

Soiling Crops for Late Summer and Fall Feeding.

Editor Maritime Farmer:—

During the last few years, dairy farmers in general, have become convinced of the necessity of sowing some crop to cut and feed green, in the late summer and early fall, to keep up the milk flow when pastures are short.

We have been following this practice for many years. Perhaps the reason we started this practice before the average farmer was that we supply a city butter trade and, therefore, we had to keep up our supply or lose the trade. In growing our soiling crops, we take a piece of stubble land, work it well, and apply a light dressing of manure, or, if we have no manure to spare, which is often the case, as we have to manure from ten to twelve acres of hoe crop every year, we take a piece of sod land and cultivate it well, too get a good seed bed. Just here I might say that it is very important to have the piece of land in which you are going to sow your soiling crop, as near the barn as possible. You will have no time to go a long distance for your load of green feed, night and morning, in the busy harvest time. The mixture we sow is the following: Oats, four parts; peas, one part and vetches on part, sowed at the rate of about four bushels to the acre. This makes a very nice feed for the cows. We generally sow about three pieces of this mixture at about intervals of ten days between each seeding. By so doing we always manage to have our supply fresh and green. When starting to feed, we give the cows only a small amount at a time, as they will not eat very much at first, increasing the quantity gradually until they are eating all they will take twice daily. Some farmers feed their green feed by throwing it over the fence to the cows in the pasture. This is a very wasteful practice, and the boss cows get more than their share, while some do not get enough. We always feed our cows in the stable, which I think is the best plan. The feed should not be allowed to get too coarse before starting to cut; better to start early, even if you do not get as much feed. This mixture does very well, up to, say, the last of September, after which time the cows do not seem to relish it. So, to take its place, we grow about two acres of corn. We manure fairly heavy for corn on stubble land or well cultivated sod. We get a good heavy crop of fodder with fairly well developed ears. We feed this as we cut it, until the first frost touches it; then we cut and stook it all in the field and we have enough to feed up to the first of December The cows eat it almost as well dry as when green, and it saves the hay wonderfully. Every dairyman, worthy of the name, should grow soiling crops. They are paying crops, as they keep up the milk flow, at a mimum cost and labor and they can be fed off the land without the trouble of storing them away in the barn.

WM. CLARK.

North Wiltshire, P. E. I.

It's easy to thoroughly clean the Frictionless Empire

Beware of separators with complicated skimming devices. It's impossible to get into the corners and crevices of such devices and clean them thoroughly.

You cannot get cream in perfect condition—cream without a taint—from a separator that cannot be thoroughly cleaned.

The few, simple, smooth cones of the Frictionless Empire are as easily cleaned as a glass tumbler — and you can clean them just as thoroughly.

Cream separated by the Frictionless Empire is sweet and clean—first quality. It makes the finest butter you ever tasted.

Your ten-year-old daughter will enjoy turning the Frictionless Empire. So nearly frictionless it almost runs itself. Unless you stop it with our brake it will run for half an hour after you quit skimming. It's the only separator with ball bearings on both top and bottom of bowl-spindle.

Years of service prove their worth. Empire separators in constant use for ten to fifteen years have cost on the average only thirty cents per year for repairs. Samuel Gilmour of Rocklyn, Ontario, says he bought an Empire, 325 lb. machine, in 1896, and it has not cost him one cent for actual repairs. He has kept on an average 15 cows.

Some day you'll own an Empire. The sooner that day arrives the better for you. And whether you choose the Frictionless Empire (cone method) or the Empire Disc you are buying certain satisfaction. There's Empire Quality in each machine, and a binding guarantee as good as a gold bond.

Get our new 25c. book. It gives unbiased information about the cone and disc methods, which are the only two standard methods of cream separation. Contains many valuable dairy pointers. We will send you one copy free, provided you tell us the number of cows you keep. Also name of this publication. Send for this book immediately. Ask for book No. 36 Extra copies 25c. 3

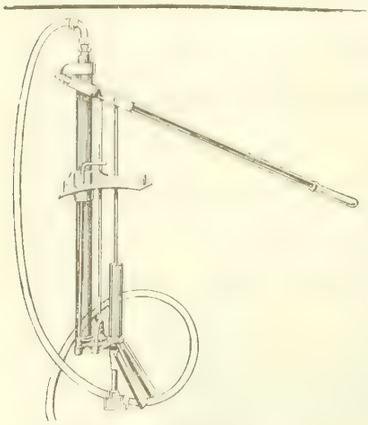
Could Not Sleep In The Dark.

Doctor Said Heart and Nerves Were Responsible.

There is many a man and woman tossing night after night upon a sleepless bed. Their eyes do not close in the sweet and refreshing repose that comes to those whose heart and nerves are right. Some constitutional disturbance, worry or disease has so debilitated and irritated the nervous system, that it cannot be quieted.

Mrs. Calvin Stark, Rossmore, Ont., writes:—"About two years ago I began to be troubled with a smothering sensation at night, when I would lie down. I got so bad I could not sleep in the dark, and would have to sit up and rub my limbs, they would become so numb. My doctor said my heart and nerves were responsible. I saw Milburn's Heart and Nerve Pills advertised and got a box to try them. I took three boxes and can now lie down and sleep without the light burning and can rest well. I can recommend them highly to all nervous and run down women."

Price 50 cents per box or 3 for $1.25 at all dealers, or mailed direct on receipt of price, by the T. Milburn Co., Limited, Toronto, Ont.



Another valuable feature in the

'Perfect' Spray Pumps

is the relief valve at the base of the air chamber. This valve is operated by the handle, which appears just above the plates, which fasten the pump to the barrel. This valve instantly drains the contents of the air chamber back into the barrel, which is valuable in a number of ways.

The Havanna Potato Market.

Mr. E. S. Kirkpatrick, Trade Commissioner, writing under date of February 15th, says:—"An article on the potato trust in Havana and it's discrimination against New Brunswick produce, which appeared in a Canadian newspaper, has since been copied and republished very widely, not only in Canada and in the United States, but has even been reproduced as a translation in Spanish in a Havana daily. This article should never have appeared in print. It is entirely misleading and has been productive of considerable harm. That there is a potato trust in Havana, composed of five men, is not to be questioned, but that they are 'five millionaires' was never suspected. Probably none wre more surprised to read such a statement than the men composing the trust themselves.

"The contention that these men have discriminated against New Brunswick produce is entirely wrong as the facts of the case will show. Previous to the present season there has never been any steamship connection between St. John and Havana and consequently no New Brunswick produce came to the Havana market. It is true that the steamer Talisman made several trips last year from St. John, but the stock arrived in such poor condition that it gave St. John shippers an unfavourable reputation in this market.

SERIOUS RESULTS FROM ONE POR SHIPMENT.

"With the beginning of the present season and the establishment of a regular service, a St. John firm opened a produce warehouse in Havana in opposition to the trust and in their first shipment brought in 3,000 barrels of potatoes. These barrels were labelled in litograph 'Canada's Best Potatoes' and as the trust had honestly believed that New Brunswick stock was of poor quality they were curious to learn in what condition this stock arrived.

"The result of that shipment is pretty well known by this time to all produce dealers. The stock arrived in such rotten condition that the greater part of it was abandoned on the docks and remained there for two weeks until such a protest was made from residents of the neighborhood that the sanitary department of the city had it carried out to sea and dumped. This was a very poor advertisement in the Havana market, for every dealer in the city had seen the stock and believed it to be typical of New Brunswick produce. The fault lay entirely in the fact that the stock was too green when shipped and was diseased as well. This experience made it doubly hard to convince the buyers that New Brunswick had a good article to sell.

WHY THE TRUST BECAME HOSTILE.

"In spite of a loss of $6,000 on this shipment, the firm who were disappointed, ordered a second cargo which arrived a month later in excellent condition. It was readily sold, although not to the trust, who were still skeptical. As time went went on small buyers began asking for New Brunswick stock, and the trust became convinced that no better, if as good, produce was arriving from any point than that from New Brunswick. They then approached the Canadian firm who were doing business in Havana and offered to buy from them all stock they cared to import on the condition that this firm should not sell to any one else. However, they could not arrive at any agreement. Then it became a battle of interests. Potatoes have have not been sold in many years in Havana as low as during the present season. No matter what quota-

Your old Carpets will make you handsome Rugs. Write for booklet mailed free.—THE MARITIME RUG WORKS, St. John, N. B

tion was made to a buyer by the St. John firm, the trust would quote a lower, but at the same time they, themselves, were paying about as much for potatoes as they had done at any time in the past.

"It is stated on good authority that the trust lost $30,000 in the month of December alone. But the fight was not against New Brunswick stock, but against one particular firm mentioned. At that time and and until the present, they have been buying New Brunswick potatoes in large quantities from other shippers. Probably 100,000 barrels have been shipped from St. John to Havana this season, of which the greater part has been purchased by the trust.

TRUST PURCHASES CANADIAN POTATOES ONLY.

"It is not to be denied that the price of potatoes in Havana is low, but this condition is entirely due to the excessive Canadian and United States crops. Maine potatoes are being quoted here now at a lower price than any from Canada, and yet notwithstanding this fact, the trust are buying almost solely from St. John and Halifax.

"Without the Havana market during the present season, the New Brunswick crop of potatoes would remained in the farmers' cellars, for there was absolutely no other market for them at any price. The Havana potato trust, instead of discriminating against New Brunswick, has bought stock from the New Brunswick shippers when they could have purchased for a lower price elsewhere.

"The trust, however, are a body of shrewd business men who have secured a good corner and mean to hold it if they can. It is urged that they are adopting no different course from that which any other body of men have adopted under similar conditions. The market might be considerably better if they were not in control, but it is too much of an undertaking for one firm to dislodge them from the position which they hold."

Are Hens Profitable?

Editor Maritime Farmer:—

The following should be sufficient proof that hens are profitable when properly handled.

In July, 1908, I purchased eight Barred Rock pullets. They began laying on October first and in the following twelve months layed 1,572 eggs or a fraction over 196 eggs each.

Three of them set in the spring of 1909 and raised thirty-one chicks.

The average price obtained for eggs during the year was 22 cents per dozen, thus making the 1,572 eggs or 131 dozen worth $25.82. The 31 chicks were worth at least 35 cents each, on October first, when they were five months old.

The total value of the chicks would then be $10.85, making the product of eight hens worth $36.67 while the cost of feeding hens and chicks was $15.36, leaving a total profit of $21.31 or a fraction over $2.66 per hen.

The hens were fed whole grain (wheat, oats and buckwheat) in litter, on the floor, in the morning; at noon, raw food, such as carrots apples, etc., and a mash at night.

Cut bone was also given three times a week. Lime, gravel and an abundant supply of water was before them at all times.

The above cost of feeding does not include scraps and skimmed milk from house or green food taken from the garden in summer, such as beet and mangel leaves, etc.

You can Know how a Wire Fence Will Wear Before You Buy It

There is no reason why you should take anybody's "say-so" about a wire fence.

You can test it before you buy it.

We have a simple formula for testing wire which we will be glad to send you along with samples of our fence wire. You can compare it with any fence that is made.

Our Peerless Fence made from all No. 9 English wire, is equal to all emergencies. It has more than double the strength required. On account of the superior galvanizing on this wire, it should last more than twice as long as ordinary galvanized wire. It stands the salt, foggy climate of England for many years where ordinary galvanized wire rusts in as many months.

The Peerless Lock at each intersection of the crossbars is the most perfect device for the purpose yet produced.

This can't-slip lock grips the two wires firmly, yet permits the fence to adjust itself to any surface.

The Peerless Fence never sags, nor is it affected by changes of temperature. Its spring coil formation allows for all contraction and expansion, the wires always remaining perfectly taut.

Don't buy a fence till you know it will last and give satisfaction.

Write to-day for our formula and test samples of all makes of fence. Compare them with Peerless — we're not afraid.

The Unruly Member.

(By Marion Hartland.)

"CORA, Cora, will nothing cure you of your sinfullt careless habit of speech?"

"Auntie, auntie, will nothing cure you of your frightfully sober habit of speech?"

"Never, while assured, as I am now, that mine are the words of truth and soberness," rejoined the elder lady, with an emphasis that was somewhat severe, yet not un kind.

But Cora Manning only laughed—the sportive laugh of a disposition as sweet as heedless. Throwing herself upon the carpet at her aunt's feet, she folded her hands with a pretty affection of penitence, and looked up into the eyes which she knew could not meet hers without an answering smile.

"You are all primed for giving me a long, delicious scolding, I perceive, auntie, so I will not disappoint you. It will remind me of dear old times. Please define, however, in the outset, what is the precise nature of the habit you condemn by such an ugly name. Am I 'sinful' and 'careless' in grammar or composition, or do you object to the subject-matter of my 'speeches'?"

"You are an educated lady, Cora. This fact should be sufficient of itself to perserve you from inaccuracies in the structure of your sentences, and your style is generally graceful and pleasant."

"Good! There is one drop of sweet to reconcile me to swallowing the abundantly bitter dose which is to come."

"I wish that I could indeed make it so bitter as to be remembered," said Aunt Janet, with increasing gravity. "I should have more hope, then, that you would set yourself seriously to work to correct a great, and, I fear, a growing evil."

"I an getting very impatient, auntie," again interrupted the saucy girl. "As they say in public debates, 'Question! question!' "

"My first question is this, my dear: Do you recollect what was your solulation to Miss Healy as she broke up your confidential chat this morning—the talk you had devoutly hoped would not be spoiled by any third person, no matter how agreeable at most older times?"

"I cannot say that I do, ma'am; I hope it did not betray my real feelings too plainly. There is no need that I should inform her that, instead of classing her among the 'agreeables' aforesaid, I have set her down at the top of the first column in my list of 'bores.' Whatever I may have said in my intense vexation, she bears me no malice for my lack of politeness, for she sat with us two mortal hours."

"One and a quarter, Cora, by the clock," corrected Aunt Janet.

"It seemed to me to be nearer four,' said Cora; "and then she apologized elaborately for 'hurrying off before'—as she phrased it—'she had half talked out.' That is a pet saying of hers, by the way. The adage that 'half a loaf is better than no bread' does not hold good in this instance, I am sure."

"Yet you were at as much pains to convince her that she had paid a brief call as you were, at her entrance, to tell her that she was 'the very person of all your acquaintances who you were wishing would call upon Aunt Janet immediately.' "

"Did I say that? I am delighted, in raptures at my graciousness of hospitality—at a display of urbanity so independent of circumstances!" cried Cora, clapping her hands. "No wonder she stayed such an unmerciful length of time. How comfortable I must have made her feel!"

"And me as thoroughly uncomfortable," continued her Aunt Janet. "I have never regarded insincerity and falsehood as synonyms, although it appears that you do. But to proceed I thought you told me that Mr. Miller left town but two days ago?"

"So he did—on Tuesday."

"And that he made you a visit on Monday evening?"

Cora blushed slightly. "Of course! You do not suppose that he would have gone away without bidding me good-by?"

"If my memory serves me rightly you added, likewise, that you expected him back on tomorrow?" the inquisitor went on to say, in the same quiet, confident tone.

"Yes, ma'am, it was his intention, when he left, to return at that time, and"—dimples breaking over her cheeks—"I do not believe he will encounter any temptation potent enough to detain him longer in the country."

"Yet"—Aunt Janet spoke very slowly here—"when Miss Healy rallied you—coarsely, I allow—upon 'the cheerfulness with which you endured the absence of your handsome beau,' you protested that you 'had not seer him for an age—a week or more,' pretended ignorance of his departure for the country, avowed a like want of knowledge as to the probable period of his return, and finally, in reply to her inexcusably rude interrogatory,' Come, now, Cora, are you engaged to him or not? Everybody says that you are, and the wedding is to come off in the spring'—you said, promptly, and with seeming earnestness, 'Everybody is wrong, then, in this, as in many other things. Mr. Miller is a friend of mine; he never had been and never can be more, if I continue in my present frame of mind.' "

"Mercy, Aunt Janet, you make my blood run cold! You remind me of a judge summing up the evidence against one convicted of a capital crime—murder in the first degree—nothing less flagrant. Surely, you did not wish me to make a confidante of the most notorious tattler in the city, in sheer compassion for the poor woman, to gratify her overweening curiosity?"

"Far from it; but I would have preferred seeing you commit this indiscretion than hearing a deliberate falsehood from the lips of my bro-

SAVED FROM AN OPERATION

By Lydia E. Pinkham's Vegetable Compound

Belleriver, Que.—"Without Lydia E. Pinkham's Vegetable Compound I would not be alive. For five months I had painful and irregular periods and inflammation of the uterus. I suffered like a martyr and thought often of death. I consulted two doctors who could do nothing for me. I went to a hospital, and the best doctors said I must submit to an operation, because I had a tumor. I went back home much discouraged. One of my cousins advised me to take your Compound, as it had cured her. I did so and soon commenced to feel better, and my appetite came back with the first bottle. Now I feel no pain and am cured. Your remedy is deserving of praise."—Mrs. EMMA CHATEL, Valleyfield, Belleriver, Quebec.

Another Operation Avoided.

Adrian, Ga.—"I suffered untold misery from female troubles, and my doctor said an operation was my only chance, and I dreaded it almost as much as death. Lydia E. Pinkham's Vegetable Compound completely cured me without an operation."—LENA V. HENRY, R.F.D. 3.

Thirty years of unparalleled success confirms the power of Lydia E. Pinkham's Vegetable Compound to cure female diseases.

MODERN MARTYRS!

The age of martyrs is not passed. There are thousands of women all over the country enduring physical torture and mental anguish almost beyond description. They are not victims of persecution, like the martyrs of old; they are not called on to face the scaffold or the stake, but their sufferings—borne in silence and hidden from the world at large—are scarcely less intense.

These ladies, as a rule, are women and girls of refined and sensitive temperaments. Knowing that their sufferings are due to a disordered condition of the female functions, their native modesty deters them from seeking relief in the earlier stages; and when they do consult a physician, they usually get some drug mixture to take internally, which is not more effective for troubles of this kind than it would be for a toothache, a bruise, or any other strictly local ailment.

The seat of the trouble being in some one of the female organs, the remedy, to be effective, must act on this portion of the anatomy.

This is the secret of the success which always follows the use of ORANGE LILY in derangements of this kind. It is a strictly local treatment. It is absorbed directly into the parts that are inflamed and congested and its beneficent, soothing influence is noticeable from the start. The irritation of the delicate membrane is relieved, the congestion is overcome by the discharge of the watery matter which served to oppress the nerves and cause mental depression; the nerves are toned and invigorated, and the sunshine and joy of life again becomes part of her being. Read the following letters:

Archer, Ont., Feb. 1, '09.

Dear Mrs. Currah:—I received your kind letter some time ago, but was feeling so well, and not needing medicine, that I neglected replying sooner. I must say I have more confidence in ORANGE LILY than in any other thing I have ever used. Before I knew or found out anything about this medicine, I doctored away hundreds of dollars, and when I thought I was dying with inflammation of the womb, a box of ORANGE LILY was sent me through the mail from a friend. The first suppository I used I was greatly relieved, and in a few months completely cured. That was nine years ago this winter, so you can imagine with what esteem I hold the ORANGE LILY. I am thankful there is such a relief for poor, suffering women, for I have been one of them and can sympathize with others. Your sincere friend, MRS. NORMAN WEAVER.

Trenton, Ont., Dec. 4th, 1909

Mrs. F. E. Currah, Windsor, Ont.—

Dear Friend,—I feel it my duty to write you a testimonial as to what Orange Lily has done for me. Last winter I was feeling very miserable indeed. I could scarcely do my housework during my menstrual period, and for two months or more I was never free from pain in the womb and ovaries. The pain would run down the groin, so I would frequently nearly double up. Then the pain began going up the back of my neck to my brain until I hardly knew what I was doing at times. Life was a burden indeed. I finally could endure it no longer, so went to our leading town doctor and had an examination. He pronounced it (I forget the word) a rigid condition of the generative organs, produced by repeated attacks of inflammation. He said I would have to take a course of treatment, and if that failed to overcome the rigid condition I might, in time, be compelled to have the ovaries removed. I objected to that, so filled out Dr. Coonley's symptom blank and forwarded it to him, and he diagnosed the disease the same as my local doctor, so I decided to take Dr. Coonley's Treatment. I have used two jars of Cerate Massage, two packages of Herbal Womb Tonic and six boxes of Orange Lily. It is eight months since I began the treatment, but I feel like a new woman. I work right through everything now. Hardly know a pain, even during menstruation now. I often say, "I would not take $100 and be in the state that I was last March." I feel that Dr. Coonley's Home Treatment is a Godsend to suffering womankind, and shall continue to sound its praises whenever I have an opportunity.

Yours gratefully, MRS. T. H. HATTON.

ORANGE LILY as a remedy for these ills, as well as for leucorrhoea, painful periods, irregularities, cancers in their earlier stages, tumors, displacements, lacerations, and all ovarian troubles, has long since passed the experimental stage. So confident am I of this that I will send ten days' treatment, which is worth 35 cents, to any sufferer ABSOLUTELY FREE. The treatment is inexpensive, used at home, and no physician is necessary. Send at once for the

ther's child, one whom I love as my own daughter."

Tears sprang to Cora's eyes. "I Aunt Janet? How can you talk so cruelly?"

"Judge for yourself, my dear. Every word we utter is either true or false. Bring your conversation of the past hour to this test, and how does it appear?"

"In love all things are fair," said Cora, gayly. "Everybody equivocates, or, if driven too hard, fibs outright, when—when situated as Horace and myself are."

" 'Everybody is wrong, then,' as I heard a sensible young friend of mine remark, not a month since. I understand and honor the delicacy which causes a woman to shrink from unveiling her heart-secrets to such prying meddlers as is this Miss Healy; still, I believe that a mild but dignified resolution not to gratify them would be a more effectual quietus to her inquiries than was the denial she evidently discredited, positively though it was uttered. I do not know your betrothed husband, but, if what you and others have told me of his character be correct, I doubt whether he would sanction the rule of lawful prevarication—'fibbing,' you term it—laid down by 'everybody,' and adopted by yourself."

"Horace has chosen me with his eyes open," returned Cora, a little resentfully. "To him, at least, I am no dissembler."

"Never be, my darling!" said the old lady. "You are too young and happy to understand how much of misery a single falsehood or the appearance of deception may bring upon those whose hearts and lives should be open as the day to one another."

With what sad experience of her own wedded life—ended years ago, by her husband's death—Aunt Janet was in rememberance, dealing, it does not now behoove us to inquire. Cora felt that self-reproach or an unforgotten sense of wrong received lent solemnity to the warning, and that further trifling on her part would be unkind. Gladly did she, for the first time in her life, hail the termination effected by other callers to a tete-a-tete interview with her favorite aunt.

To Mrs. Barrett, better known to her circle of associates as "Aunt Janet," has been committed the care of Cora during her mother's invalidism, a tedious spell of several years' continuance. The improved health of the latter, and the removal to another town of the more judicious and not less affectionate aunt, had subjected the girl to a different course of training. Of late years, Mrs. Barrett's visits at her brother's home had been short and infreuquent, and it was, therefore, with emotions of no ordinary pleasure that the family received her acceptance of their invitation to spend with them the winter which was to end Cora's singlehood. To the last mentioned member of the household the arrangement was frought with peculiar delight, if for no other reason than because it was to bring the realization of a cherished desire, viz., that her lover should see and appreciate her best beloved of friends, the foster-mother whom she never wearied of describing and extolling to him.

Cora had been universally admired since her debut in general society, two seasons before—adulation which had failed to impair the many domestic virtues that made her the pet of the home she now brightened, and fitted her, in most respects, to become the sun and centre of the more narrow sphere she ever adorned in Horace Miller's dreams of his future. Whether it were the warm breath of flattery, producing in the fertile soil the legitimate fruits of an undue ambition to shine and to please, that had brought to light less lovely traits and tendencies, defects that were grievous blots upon the otherwise fair page of character, or whether these had been more slowly developed under a somewhat loose family government, Mrs. Barrett could not decide. Her upright mind only detected and recoiled at the unlooked-for blemish, and love united with conscientiousness in urging her to do her utmost to check the noxious growth. Her rebuke was taken as kindly as it was given. Aunt Janet sighed as she caught herself almost wishing that her adopted child's temper was less even and sunny, at least that her nature were less mercurial, so evident was it that, an hour after such grave admonitions had been pressed upon her consideration, not a rankling recollection of what had transpired remained to disturb her enjoyment of the day's employments and recreations.

(Continued next issue.)

How often do you eat this food?

A short time ago there appeared in the columns of one of the prominent magazines an article on building brain and muscle by the proper selection of the foods you eat.

A good many people were surprised to find oatmeal placed at the top of the list of foods recommended; but if the article had appeared in an English or Scotch paper every reader would have expected to see first place given to good oatmeal.

As a matter of fact Great Britian and Europe come to us for tremendous quantities of Quaker Oats because it represents to them perfect food, being the richest in flavor and best in cleanliness and purity, of all oatmeals.

Americans should eat more Quaker Oats; the results would soon show themselves in improved conditions of health and strength.

House Cleaning and Tree Planting.

Editor Maritime Farmer:—

House cleaning time is again at hand. The time when we must wage war on dust and micmicrobes, with broom and dust cap, hot water and disinfectants. Every woman dreads it more or less because it means hard work and drudgery. It is something you cannot simplify very much, and you have of necessity, to go through the same routine year after year.

At the cleaning season last year I was ill, and with the incapable help that I had, wondered how I should ever clean a house of eighteen rooms and live. I thought about it, puzzled over it for days, and at last mapped out a sort of a system. Am going to tell what I did, and if one idea is given, I shall not have written in vain.

Before doing anything at cleaning, I made six good sized laundry bags. These were labelled White Cotton Scraps, Prints, Yarn, Silk and Velvet Scraps, Cloth, Rags. Then we began in the attic, sorted out the different things that were any good and put them in their respective bags. It was astonishing what I found tucked away there of no value whatever—old shoes, old clothing, cracked dishes, broken chairs past all usefulness, and numerous other articles that cluttered up the place and made a nest for moths. These were all piled in large baskets, carried to a suitable place and burned. At the close of day we had a nice clean attic systematically arranged, and as I cast my eye out the window on the bone pile, wondered why I had been storing such useless things.

Then before I began at the bed rooms we cleaned bureau drawers putting all scraps in their proper place. Next the closets, doing likewise. In each place we found many things that needed to be consigned. After this one bed room at a time was cleaned and settled to a finish until the whole upstair was done. We took down a lot of old pictures and bric-a-bac that were out of date and piled them up with the rubbish. Our rooms looked so clean and cool when done, it was a pleasure to look over them, and "tired nature's sweet restorer, balmy sleep" was all the more refreshing because we were brought to our resting bed weary and content.

Before starting in down stairs I took a week's rest. It is a great mistake for women to clean from six in the morning till six and sometimes after at night. It is too strenuous, it wears you out, destroys your nerves and ruins your temper.

After my weeks rest, I began with renewed ambition, cleaning first the drawing room, then the libary and so on through to the shed, but at no time overworking. The world was not made in day, and if we live there is plenty of time to do our work without abusing the temples God has given us. If we die, there are others to take up our work just where we left off. When carpets had to be taken up I found it a good plan to draw the tacks out after tea, next morning, before the men went to work, they lifted them, and cleaned them generally, they also helped to put them down. Now that I had gotten my house thoroughly cleaned, neither

BILIOUSNESS AND ALL LIVER DISORDERS

front nor back yard looked in keeping with the inside, this I told my husband, after some hesitation he consented to let me have help to clean them up. We tackled the back yard first, Oh ye Gods! what a conglomerated mess: There was a pile of sawdust from the wood sawing last year, old sleds, old iron, big chunks of wood, an old horse rake, chips, broken potato barrels—in fact it was a typical out of date farmers yard. We got a team and it did not take long for all hands to clean this off. Then the maid, the children and myself raked it nice and clean, it was hard work, but felt well repaid when done. Around the kitchen verandah we set out a number of good size hop vines. They grew well, and by August were a beautiful green mass. A little further out in a suitable place we set six fir trees, all as near the same age as we could get. After a few more touches I felt that order had come of chaos and my little girl said it looked liked a Ladies' Home Journal yard. Needless to say I was tired and had to take another week's rest, but all the time was planning what could be done with the front yard. Here the outlook was not so discouraging. Our house was built on a flat and the front was always green in summer.

So we laid off a good sized square enclosing it with fir trees. We like the fir because it is nice and green all the year and it is also a clean tree. We have no front verandah, so I planted the five fingered ivy all around the front door and windows. These trees and vines had to be watered twice a day—morning and evening and we were rewarded by seeing the vines all grow and all the trees but three, which we will replace this year. My little boys thought they would like a summer house in one corner. This they built, it was not a masterpiece by any means, but the work was done by willing hands and a desire to help. We planted ivy all around it, so that in a short time nothing will be seen of the crude structure. Another thing the children did that I thought was pretty—they made three circles of common field stone, one foot high and three in diameter, filled with good earth and planted with nasturtions. The stones seemed to draw the heat, and they grew beautifully, supplying flowers for our table all summer. By this time it was getting late, so we decided to do no more that year. It was wonderful the improvement it had made in our place. My husband said it enhanced the value $500. What pleased me most was the interest the children took in this affair. Think ye, years hence, when they have left the old nest to do for themselves they will ever forget this tree planting? Never. They will love the memory of it because they and mother, planted them, watered them, and watched them grow. If we old people are left sad and lonely on the farm, can we not blame ourselves to some extent? Have we tried to make the farm home as pleasant and up to date as we might? Have we given the boys and girls something of their own to interest them—have we given them occasional pleasure instead of all grind? Do they get their holidays as in other business? Let us begin a new era and educate our boys and girls to stay on the farm instead of driving them away with so much of the ordinary humdrum of life. There is peace, plenty and happiness for the industrious, and money too for all the necessaries and pleasures of life. Don't be in a hurry to leave the old farm boys, it is far ahead of a dingy rent in a big city where your salary is just enough to eke out an economical living.

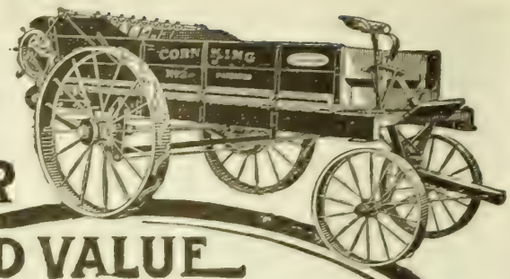
BUY A MANURE SPREADER OF PROVED VALUE



Not an Experiment

GOOD MANURE SPREADERS are now so generally recognized as big money makers, time and labor savers, that the demand has grown by leaps and bounds. The result is that the market has become flooded with spreaders of slipshod quality. Therefore don't be influenced by extravagant claims when choosing your spreader. Look to the actual construction, the materials, the practical points of strength and operation. Look to the experience, equipment and standing of the manufacturer.

I H C Spreaders

Corn King **Cloverleaf**

These spreaders of the I H C line have proved their value in actual operation in the hands of satisfied farmers everywhere. The 1910 patterns represent the development of study, experience and practical use. Their strength to withstand the hardest strains, their sure, steady, simple operation, their light draft—these features have been tested by us as well as by the farming world and found right.

Don't delay the day of realizing on the full value of every bushel of manure. Get a spreader now—and choose carefully. Buy the spreader of proved value—of uniform high quality. Buy the spreader that is built on the right principle, of the finest materials, by the highest class of skilled workmen, in the best manure spreader works in the world. If you do that, you will get an I H C. No other spreaders have ever done the work as well, as quickly or as easily as the I H C line. For no others are so good on any point of construction. You owe it to yourself to investigate the I H C spreader that meets your needs.

I H C spreaders are made in various sizes, from 30 bushels to 70 bushels capacity, and there is a style and size for every section and condition. Choose to suit your special requirements from the only complete line. Large spreaders for big operations—spreaders for orchards, vineyards—in fact, for every condition.

It will be of considerable advantage to you to call on our local agent for catalogues and full information, or write the International Harvester Company of America at nearest branch house for these today.

Summer Care of Sick Babies.

The following circular was prepared for use in connection with Infants' Milk Depot Work by the "Conference on the Summer Care of Babies," representing the Departments of Health and of Education, and fifty hospitals, dispensaries, settlements, and other agencies in New York:

4,500 Babies died in New York City last summer from diarrhoeal diseases. Most of them died because Most of them died because they were given improper food. They could have been saved if they had been taken to the doctor at the beginning of their illness, and had been properly fed.

In hot weather, two or three loose movements a day, even though the baby seems to be well, may indicate the beginning of serious illness; a doctor should see the baby at once. Remember that it is far easier to keep the baby well than to cure it when sick.

The baby is sick when it vomits or has diarrhoea, and it is seriously sick when it has several loose green passages a day containing mucus and curds. Improper food is the cause of such illness; therefore stop all food, give cool boiled water and take the baby to a doctor at once. In summer it is dangeraus to wait.

Breast-fed babies often vomit or have diarrhea because the mother is sick or tired out and her milk is poor.

Improper food Irregular meals Lack of rest and sleep Too frequent or too prolonged nursing	weaken the mother and injure her milk.

These causes act especially in hot weather.

Nursing mothers should therefore keep themselves well and their milk in good condition, by eating at reglar hours, three plain, well-cooked meals a day, and they should drink water between meals. They should nurse the baby at regular hours. They should keep their bowels regular; constipation in a nursing mother often causes colic in her baby. Qarge quantities of tea, coffee and beer do not improve the quality of a mother's milk and may be injurious to her baby. So long as the mother keeps well the baby will be well.

If the mother is ill or "run down" or the baby has diarrhoea and vomiting, she should consult a doctor at once before the baby other foods or bottle-feeding. The quality of the mother's milk may be improved by improving her health.

Bottle-fed babies often have diarrhoea and vomiting because the milk used is bad and old, or the feeding are not properly prepared or properly kept, or the nursing-bottles and nipples are dirty.

Bottle-fed babies must be given only good milk which is kept constantly covered and on ice. Use milk furnished by the milk depots or diet kitchens; if the milk stations are not convenient, get good bottled milk which is delivered every morning. If the milk cannot be kept properly cooled it should be boiled as soon as received.

Prepare the feedings for the baby exactly as the doctor directs. Feed the baby at regular hours. Each feeding should be heated to a proper temperature in the nursing bottle before it is given to the baby. Taste a spoonful of the milk immediately before giving it to the baby to be sure that it has not soured. If the milk is not sweet do not give it to the baby.

As soon as the bottle used by the baby is empty it should be thoroughly washed with cold water, then cleansed with borax and hot water

VANCO Lime Sulphur Solution

(Made in Canada)

Lime Sulphur Solution has absolutely proved its efficiency as a fungicide and destroyer of parasites on trees and vegetables.

"VANCO" Lime Sulphur Solution is the best form in which you can get this valuable spray.

"VANCO" has more sulphur in solution, gallon for gallon, than any other preparation, and is consequently more effective.

"VANCO" is uniform in quality, so you can always depend on it.

"VANCO" Lime Sulphur Solution contains no sediment. Every ounce is active material, and there is no sludge to clog the nozzles.

One barrel makes 12 for spring, or 50 for summer spray. $8.00 per bbl. f. o. b. Toronto.

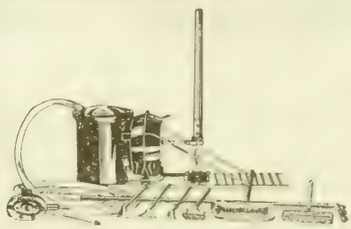
"VANCO" Lead Arsenate

is the surest and safest spray for all leaf-eating insects. It kills more certainly than Paris Green, sprays easier, sticks better, and never burns the foliage. Contains 15% to 16% Arsenic Oxide.

10c. to 13c. per lb. according to quantity.

We introduce the idea of High Quality at Lowest Price. "VANCO" Spray Chemicals are prepared by practical men, and have successfully passed Government analyses and practical tests.

Chemical Laboratories Limited 10
138-148 Van Horne Street, - - TORONTO.



Housecleaning made a delightful undertaking, with a **Perfect Vacuum Cleaner.**

Rugs, carpets, furniture, bedding, etc., thoroughly and quickly cleaned, without being disturbed.—A cleaner that is light, strong, simple in construction, effective and easily cleaned, and has a blower attachment.

Hand Power $25.00 Water Motor $35.00 A. C. Electric $70.00

McKuen's Perfect Combined Washing Machine and Boiler

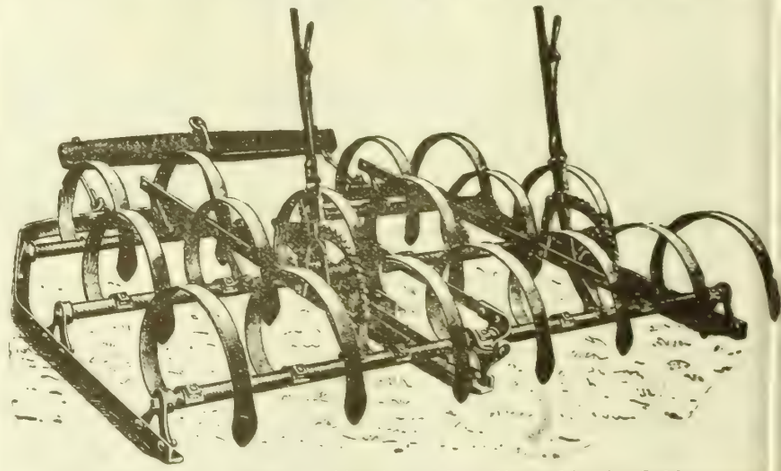
A PERFECT Washing machine. The latest on the market, "1910"; one that will do the washing right on the stove, while the clothes are boiling, no rubbing, no rinsing, no damage to the most delicate fabric, producing cleaner and much whiter clothes. A complete surprise to everybody.

Prices $10.00 and up

Purely Canadian. Patented bothhere and in United States.
Write for pamphlets and further particulars.
Mail orders receive special attention.

The Perfect Mfg. Co., Guelph, Ontario.

Lever Spring Tooth Harrows



The finest harrow made. Teeth can be adjusted in the field to any depth, and work regulated as required. Saves largely on labor and does more effective work than any Harrow on the market. Highly recommended by progressive farmers who have them in use.

——MADE BY——

Bailey-Underwood Co., Ltd., New Glasgow, N. S.

(teaspoonful of borax to a pint of water). The empty bottles should be put upside down on a shelf. The bottles should be boiled just before filling for the next feeding. The nipple should be thoroughly washed after each nursing with hot water, and when not in use should soak in borax water in a covered glass; the nipple must be rinsed in boiling water just before the baby uses it.

Clothing.—During the very hot days, or if the baby has fever, remove nearly all the clothing. A muslin slip or gauze shirt is enough. A baby with fever will not catch cold.

Bathing.—A baby should have one tub bath every day; on very warm days from two to four eneral spongings with cool water. If the baby has fever sponge it with cool water every two or three hours and place cool, wet cloths on its head.

Fresh Air.—Babies, sick or well, must have fresh air. Keep the baby in the largest, coolest room in the house or apartment. Keep as little fire as possible Keep the rooms free from garbage, soiled clothes and rubbish. Leave the windows open day and night. Avoid the sun on hot days. Select the shady side of the street and the shade of the parks, recreation piers and roofs.

Sleep and Quiet.—Keep the baby quiet. Let it sleep alone and let it sleep as much as possible. Lay it on a firm bed, not on feather pillows. Keep the baby and bedclothes clean. Change the diaper and bedclothes as soon as soiled, and sponge the baby with a soft cloth and cool water. If this is done the baby will not be so restless and will sleek better. Do not give "soothing syrup" to make the baby quiet, and do not let the baby hang on the nipple or suck a "baby comforter."

Diapers.—Diapers should be carefully washed as soon as they become soiled, and then dried in the open air. Do not use a soiled diaper a second time before washing it.

Echoes from the Winter Poultry Shows.

Editor Maritime Farmer:—

I had the pleasure of going to New Brunswick twice this winter, in the capacity of judge at two of your poultry shows. The first occasion was for the show held at Moncton, in the second week of January, and the second for the show held at St. John, in the latter part of February.

We, in Ontario, have always been inclined to look on Poultry Culture in the Maritime Provinces, as one of the much neglected branches of agriculture. That we will soon have ito reconstruct our ideas, was made very plain to me on these trips. The amount of enthusiasm displayed at these two shows, coupled with the fact that, the New Brunswick government is taking up the work of poultry education, points to a rapid change in the poultry situation. The breeders will do their part; and let the government show the farmers of the provinces the amount of profit that can be made by keeping a flock of good fowl, and they will readily take up the work. With the Montreal markets, the best in Canada, within easy reach, where eggs sell for about sixty cents a dozen in winter, and dressed fowl at about twenty-five cents a pound, it should not be hard to convince the farmers, of the profit of the business, if the matter is just laid before them in the proper light.

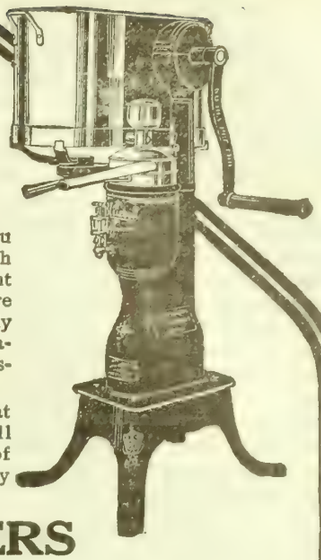
At Moncton, I found a show consisting of 854 entries. The heavy classes being the Barred Plymouth Rocks and White Wyandottes. The Leghorn classes were also well filled, and the quality was kery fair. Mr. Jackson, the president, and Mr. Seaman, the secretary, together with their assistants, deserve great praise for the way they worked this show up. My old friend, Mr. A. G. Gilbert, of the poultry department, at the Central Experimental Farm, dropped in for a few hours, and gave those present a short talk on poultry matters which was much appreciated.

At St. John, I found a show smaller in point of entries, but most of the birds shown had been "tried out" at the earlier shows, so the quality was fairly good throughout. While it was a disadvantage from the standpoint of attendance, having the show held on the third floor, it was not in the matter of light. The room was nice and bright all day long, and as the coops were not piled too high, it left a chance for the free passage of the light. The show was conducted in a very satisfactory manner, everything being kept nice and clean during the whole time. I was down the night before the opening, and it was a pleasure to see the way the members worked, everyone cheerful and willing to help, so that everything went along smoothly. The Barred Plymouth Rocks, White and Brown Leghorns and Black Minorcas were the heavy classes and contained some good birds. There were also some nice ones shown in White Rocks and White Orpingtons, an Indian game cock, with grand color but lacking a little in shape; a good S. C. R. I. Red cockerel and also a fair pullet of the same breed, a good White Wyandotte hen and nice Silvers. In Golden Wyandottes the winning cock, and the three winning pullets, deserved special mention. Taking it all in all, the show was a decided success, and the secretary, Mr. Bain, and the rest of the association, are to be congratulated on the way it was managed.

I wish to take this opportunity to thank the officers and exhibitors of both these shows, for the courteous treatment which was accorded me while in New Brunswick, and hope that at some future time, I will be able to renew acquaintances with them. The enthusiam displayed at these shows speaks well for future shows held in the province.

GEORGE ROBERTSON.
Poultry Judge, Ottawa.

THE WAY TO GET FULL VALUE
From Every Pail of Milk With Least Labor



YOU are not making all the money you could make out of the cows you keep unless you use an I H C Cream Harvester. You know how much butter fat you lose if you skim the old-fashioned way—from 20 per cent to 40 per cent—not to mention the time and labor wasted. Such methods are out of the question for the farmer with the 1910 spirit of progress. It is equally poor business to use a cheap, out-of-date or makeshift separator. Such machines are hard to clean, hard to turn, last but a short time, never give satisfaction, are never worth the price.

The money-making dairyman is the man who invests in a separator that will skim to a trace; that is simple enough to be kept perfectly sweet at all times, so he gets quality cream; one that turns easily—so that any member of the family may skim without effort; one that will do the work day in and day out, year after year. For such a separator choose one of the

I H C CREAM HARVESTERS

Be sure to investigate these machines before you consider buying any other make at any price. That is all we ask. You don't need to be an expert to see that the design and construction of an I H C is more simple and practical than any other. The only one with dust and milk-proof gearing; most perfect straining device insuring pure cream and skim milk; frame entirely protected from wear by bronze bushings at all points; has largest shafts, bushings and bearings; simplest, surest, most economical oiling arrangement; flexible top bearing prevents vibration and keeps bowl steadied, no matter if power is unevenly applied; many other features equally superior to all other separators.

I H C Cream Harvesters are made in two styles—the Bluebell, gear drive—the Dairymaid, chain drive. Four sizes in each style. No matter how few or how many cows you keep, we can meet your requirements. See the International local agent; or write International Harvester Company of America at nearest branch house for catalogue and full information.

CANADIAN BRANCHES: Brandon, Calgary, Edmonton, Hamilton, London, Montreal, Ottawa, Regina, Saskatoon, St. John, Winnipeg, Yorkton.

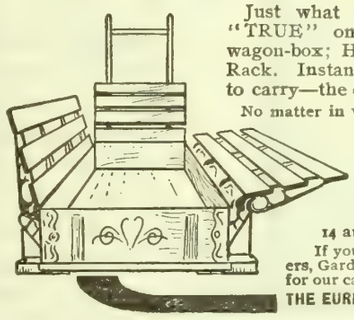
"TRUE" COMBINATION WAGON BOX AND RACK



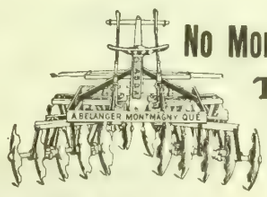
Just what every farmer needs. With the "TRUE" on his wagon he has a first-class wagon-box; Hay, Stock, Corn, Wood or Poultry Rack. Instantly adjusted for any load you want to carry—the only tools you need are your hands.

No matter in what position you put the wings, it is impossible for them to get out of that position, but it would take you but an instant to change them.

We guarantee this article to be made of nothing but the best of material—Yellow Pine, Hardwood and Malleable Iron—and to carry two tons in any position. Made in 14 and 16-ft. lengths and 38, 40 and 42-inch widths.

If you need anything in the line of Planters, Seeders, Garden Drills and Cultivators, Sprayers, etc., write for our catalogue. We have dealers in your town. 3

THE EUREKA PLANTER CO., Limited - Woodstock, Ont.



No More Use For a Plow!
The Double Action Cutaway Disc Harrow

Quickly reduces tough stubble and hard baked adobe lands to plant food without the use of a plow. Thoroughly stirs the soil and lets in the air—keeps surface true—all other disc harrows have to be run in half laps. Shape of discs and disposition of sections allow of working at any angle on the field. Jointed pole takes all weight off horses' neck. Does twice as much as other harrows with less draft.

Will increase your crops from 25 to 30%. Is fully guaranteed by us as the most effective cultivator made. Write for fully descriptive booklet and prices.

Accommodations for Live Stock a the Dominion Fair.

The Dominion Exhibition at St. John will demonstrate to stock breeders, and for that matter to the public at large, what may be rightly considered to be the "last word" in up-to-date live stock accommodations. At the time of writing, contracting builders are going over plans submitted by the Exhibition Association and in a few days tenders will be opened. Mr. W. F. Burditt, Maritime Provincial representative of the Frost & Wood Company, well known Canadian farm machinery manufacturers, has for some years made this department of St. John exhibitions his especial labor and the materialization of present plans will be the composite result of his careful study at Toronto, Sherbrooke and other big fairs last year. Mr. Burditt has gone even further than this and in many ways the St. John accommodations for live stock will out-point other shows in special excellence.

The principal feature in cattle accommodations this year will be that every animal will be under cover. There will be no exposure to wind and weather and spectators standing at the top of the decline walk or corridor, will be enabled to look upon 500 head of cattle at a glance, something entirely unique in cattle exhibiting. The spectator's corridor will be 4½ feet wide and the peculiar advantage of taking in the whole show of cattle at a sweep.

There will be ample light and perfect ventilation, an entire absence or muss and, as before stated, animals and spectators will be enclosed in a large airy building. A continuous row of windows at the back of the stalls will make the interior as light as out-of-doors. These conditions compared to the inadequate facilities and rough sheds of former fairs should be of especial satisfaction to exhibitors particularly. That the public will appreciate the improvement is without question as it will be quite unnecessary to tramp about between the sheds as before. Indeed at Toronto and other arge fairs live stock is housed in numerous detached structures making a comprehensive inspection a matter of tiresome detail.

Cattle exhibitors will be interested in machinery to be installed for the carrying away of litter and accumulations in the cattle sheds. This is a large iron receptacle suspended from a rail-track which is lowered in front of each stall, filled and rapidly propelled through the air to the exit, where it is dumped into carts. There are a few of these carriers in operation already among progressive NewiBrunswick farmers but the vast majority will doubtless see them demonstraed for the first time. The drainage in the sheds will be on up-to-date lines and thoroughly efficient, and water outlets will be distrubuted in convenient sections obviating the bothersome necessity of leading cattle to outdoor tubs and troughs as heretofore.

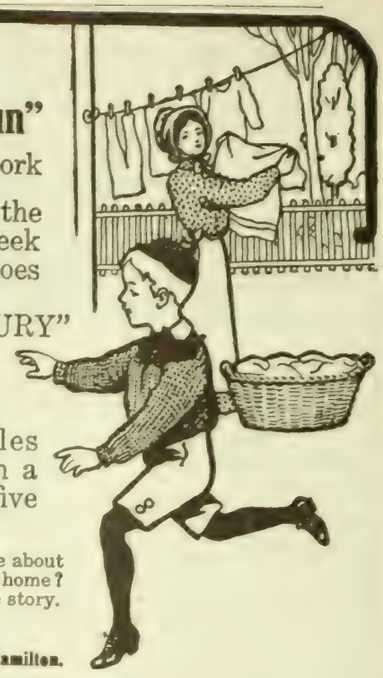
It is planned to have the accommodation for sheep in keeping with most modern ideas. In this department spectators will be afforded an excellent view of the little animals from two large elevated walks. On either side of these walks will be series of pens, each pen 6 feet square. It is expected there will be more than half a hundred of these. Picket work and open-work carpentry generally will chatacterize the makeup of this structure, assuring free circulation of air and healthy temperature for the wool-coated crea-

"Too Late—The Washing's Done. You Have Missed All The Fun"

The "NEW CENTURY" takes all the work out of wash-day.

It makes wash-day, the easiest day of the week to the woman who does her own work.

The "NEW CENTURY" —with its ball bearings, powerful spiral springs and easy action—enables even a child to wash a tubful of clothes in five minutes.



Why don't YOU learn more about the no-work way of washing at home? Our booklets tell the whole story. Write for them.

"the finish that endures"

ML Floorglaze

Use it to make floors bright and smooth as glass, easy to keep clean, (soap and water won't hurt M L Floorglaze). Doesn't get cracky; doesn't show scratches; lasts amazingly and holds its beauty. Surpasses paint or varnish or stain. Renovate your whole house with M L Floorglaze at small cost—a gallon coats 500 square feet. Apply it yourself to-day and it will be dry to-morrow morning. Get M L Floorglaze now.

M L FLOORGLAZE comes in tins of handy size, little and big. Choose among 17 enduring colors in solid enamel—seven shades in Lacs that imitate hardwoods exactly—and Transparent for natural finish. M L Floorglaze won't fade and is weather-proof—so use it on outdoor work as well as for indoors. Has a hundred uses about your home—ask your dealer or get new from us direct. Imperial Varnish & Color Co., Ltd., Toronto, Ont.

Recommended and Sold by All Reliable Paint Dealers and Hardware Merchants

Make this 60-Day Test of Brantford Roofing--then Test Any Other Make

Write us, or your dealer, for sample of *Brantford Asphalt Roofing*. Place it in water for sixty days. When you remove it, rip open with heavy knife, and you'll find insides—the vital part—perfectly dry, life-like, solid—as *before* test. Just think of severeness of this test! The result is evidence you *cannot* overlook. Then make this test with *any other* Roofing. You'll find the wood pulp—jute or cotton-cloth insides soaked—softened—lifeless. It *cannot* withstand severe weather, which is, at its worst, not *one-twentieth* so severe as *Brantford's Test*. Wood pulp is like paper. It *acts* like paper, when soaked—wilts away. How *could* you expect such a foundation to fight off Roofing Enemies! For resistance, it *must* depend upon animal fat, grease, or other refuse coating, themselves veritable mines of danger. They evaporate—wear off—expose shameful foundation to awaiting enemies. This coating cannot *prevent* penetration—protect defenceless insides from harm. But *Brantford Asphalt Roofing* Foundation is one sheet of evenly-condensed, long-fibred *pure Wool*, with life and body of its *own*. A *secret* mixture of *Asphalt* is *forced* into it, soaking every fibre. After mixture dries, foundation possesses resisting-power *no* amount of soaking or bending can effect.

Brantford Roofing

after special Water-proof Coating, into which Silica Sand is rolled under pressure, is applied, becomes a solid mass of resistance. It is weather, acid, alkali, frost, water-proof. *Cannot* freeze, crack or melt. Wonderfully pliable. Brantford has but one cost—first. Write for free Book and Samples.

Brantford Asphalt Roofing, No. 1, 2, 3.
Brantford Rubber Roofing, No. 1, 2, 3.
Brantford Crystal Roofing, one grade only, (heavy).
Mohawk Roofing, one grade only.
BRANTFORD ROOFING CO., Ltd., BRANTFORD, CAN.

tures. The sides of the building will be open but provision is made against stress of weather. Should any of the days be inclement spectators will also be protected, which was not the case at the last and previous exhibitions.

The piggery will largely follow the same plan of erection as the sheep pens, special attention being paid to ventilation, freedom from overcrowding, sufficient lighting and satisfactory sight-seeing.

Heretofore, exhibits of horses have been made in long rows of box stalls. These stalls will remain but in addition there will be generous accommodation for harness horses in new barns to be situated in the north-east section of the fair grounds. These will be arranged with broad central aisles for the convenience of spectators and long rows of stalls on the sides. Day light will be furnished through the roof, and ventilation is to be provided by modern methods.

As has been announced in the daily press the poultry and pet stock will be housed in what has heretofore been known as agricultural hall, a large building standing between the central area and the cattle reservation. Practically twice as many birds and small stock can be accommodated here than under the old conditions. The building is to be altered and adapted to insure satisfactory lighting and fresh air, and the present calculation is every inch of space available will be taken up.

The big Dominion Show is almost a half year distant but the exhibition association and the central management on Prince William Street, St. John is thoroughly dealing with details which augers well for the early consummation of all plans and an exposition of the resources of Canada particularly the Maritime Provinces, that will astound our eastern people and make the whole big Dominion sit bolt $upright and take notice.

Don't Judge a Roofing by its Looks.

Beware Imitations.

Most ready roofings look the same. The weather alone finds the hidden weakness.

You can't tell by looks which roofing will last or which will go to to pieces in a season.

But you **can** do this. You can identify from its 300 substitutes the **only** roofing which **has lasted.**

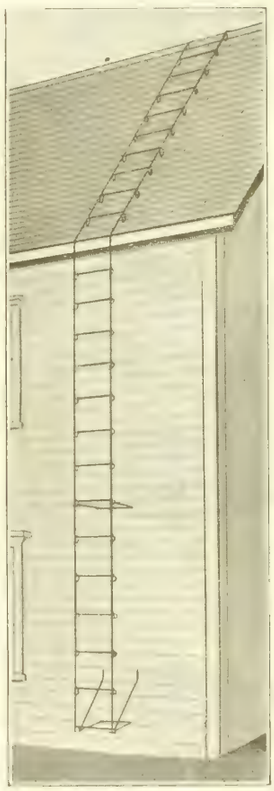
ONE Agent Made $156.45 in 20 Days Selling the Acme Steel Ladder.

This Proves It a Seller. It is New and Useful.



In the short time the ACME STEEL LINK LADDER has been on the market, it has shown itself to be far superior to the wooden ladder, which not only rots out in a very few years, but also retains moisture, and consequently rots the building. The little feet which holds the ACME LADDER out from the building or roof about three inches, do away with the holding of any moisture, and allows the sun to come in contact with the building at all points, except the immediate point of contact on the seat of the ladder, which is so small that damage cannot result under the most unfavorable conditions.

It is a neat appearing ladder on a building and one that will last—you might say—for all time to come and will always be perfectly safe to use. You can, by its mechanical construction, add to its length at any time, if required, as there is just one link to each foot. Another advantage you will often hear users of the ACME STEEL LADDER put forth is that it is a ladder that will not be lent, and you will always have it when you want it. In fact you never know when you are going to want a ladder, and you may have no use for one for some time, but when you least expect it, you may want one the worst way and would give many times the price if you had one on the roof.

Every person will agree that they should have a ladder, in fact most people at some time, have had one, but in many cases it has either been lent back and forth until it has become lost or broken or it has been left on the building until it has rotted, and consequently a very large percentage of the buildings to-day have not a ladder near them and many times a fire could have been avoided if they had had one.

Other steel link ladders have been made and sold, but there is no steel link ladder possessing the features in its make up, which give the perfect rigidity that the ACME STEEL LADDER DOES. The ladder is perfectly rigid when put together

The construction is such that it can be turned at any angle, thus enabling the user to drop his ladder from the roof peak to the eave, and then by breaking at the latter point, suspend the remainder of the ladder so as to have it come into contact with the ground.

Being made entirely of steel, it is impossible for it to burn during a fire. It makes a very good fire escape and is commonly used as such. The patent lock on the ACME LADDER makes it impossible to buckle, and also keeps the sides of the links from springing together, which is of very great importance when put to the test.

In fact one can safely sing:

"If I wanted a ladder to reach the sky,
The Acme Ladder I'd certainly buy."

We still want good live agents in a few unrepresented sections. If we have not an agent in your district, write us for our selling proposition.

ACME STEEL LADDER CO., - - Sussex, N. B.

Wanted Live Men.

We pay salary or commission. It all depends upon what you can do.

Each application will be dealt with as received.

Personal calls given priority.

We want men of brains—with energy.

Men, who want to make good and increase their earning capacity, who are too ambitious to drag along day after day in inferior positions.

We want several men of this class as travelling representatives of the MARITIME FARMER.

The MARITIME FARMER is an easy seller because nearly every farmer in the Maritime Provinces wants it when he sees it.

To those capable of handling this proposition, we furnish with teams and pay a liberal salary.

If you think you are of the right material and have a capacity for work, write us.

The Mariime Farmer,
Sussex, N. B.

Labor Saving Device in the Home.

One of the best labor saving devices is "not to worry." Worry uses up a tremendous amount of nervous energy and when one worries and frets and fusses over all they have to do they accompolish far less than one who takes life more moderately.

Do you not remember the story of the Hare and the Tortoise? How that hare did fuss and keep looking back and even mocking the poor tortoise, who plodded on calmly and reached the goal first.

One can become as tired from worrying as from actual work. I have in mind a woman who lived to be about eighty, she had done all her own work for many years, if not always; kept her house in exquiite order; looked after her family; tended carefully to a flower and vegetable garden. She was unruffled and cheerful; have always a kindly, thoughtful word for every one. When her when her friends came to see her, she would set before them a dainty little lunch. Her brow was smooth; she always had a bright smile for young and old, and every day of her life from one until two o'clock she lay on her bed in her quiet room and slept or rested.

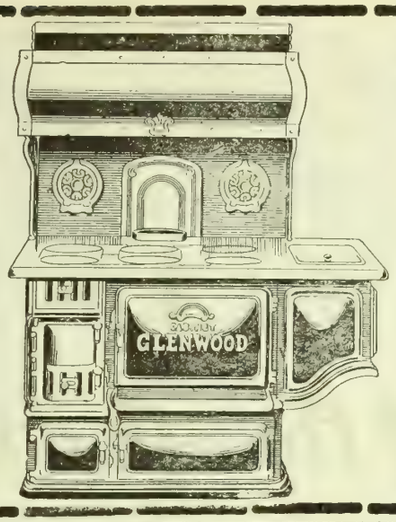
Any device which saves strength must be a labor saving device. The body can be so wisely used that we can make of it a labor saving device. For instance: The back bone is a double curved line of bones of great strength and flexibility and if kept in its proper position the other organs will likewise be in their proper places. Its flexibility enables us to move about with much freedom, but when these different movements are completed the back bone should come back to its natural position and when possible be kept there. There are so many suggestions of how this may be done. First, in standing; again, sitting we will say for sewing. When paring potatoes over a table that is too low or opening an oven door to see how badly your pie is burned, why not drop to one knee rather than throw the body out of its natural position.

In lifting a chair you will find that the muscles of the arms alone can be made to take the strain and the muscles of the back need not be used at all. And in sweeping also the muscles of the arms may bear the strain rather than the back.

It is less tiring to a short body to reach up to a table or sink than for a tall person to stoop down to one, and a short person could use a stool.

I have sympathized with those who do the family washing, so much more since the winter I did my own and had to use fixed tubs set entirely too low for my comfort. Will you try the experiment of placing your tubs high enough to prevent your ɹoop bɐuᴉpnᴉʇs ɐuʎ ɯoɹǝ ʇɥɐu absolutely necessary, and not only the tubs but your working tables or the sink where you wash dishes 1095 times in the year.

"Making the head save the feet," is a familiar saying. Perhaps too much so, for familiarity often breeds contempt. The following may illustrate how a little planning saved the feet many useless steps. In a household science class room of one of our colleges were two cupboards at opposite corners of a very large room. And at one end of this room were three cooking stoves, two sinks and working table. The cupboard at this end of the class room occupied one corner and had four shelves enclosed within glass doors. The two lower shelves held the glass ware of the class, tumblers, plates, fruit bowls, things used when a dinner or luncheon was served, perhaps once or twice a year. The cupboard at the far off corner of the room contained the kitchen linen, the wash clothes



Do You Want a First-Class Range that has been Proven So by the Hundreds that are Using Them ? Then Get a GLENWOOD.

This cut shows our Cabinet Glenwood with Hot Closet and Reservoir. A Range that is made to do the work of Hotels and Restaurants, Camps Families, or anywhere that a stove is used to its fullest extent, it will stand the wear. In offering our Glenwood Ranges we are not giving you a Range at cost or below cost, but we are giving you a first-class Range at a fair price. We are not going through the country forcing goods on the people, but we will prepay freight to any Station or place that you want a Range sent.

Write for prices and booklets of our Glenwood Ranges. All our Glenwood Ranges are made in St. John by

McLean-Holt & Co., 155 Union St., St. John, N. B.

AND BECOME

A MAN

All men cannot be MILLIONAIRES, but thousands of them could be much better off FINANCIALLY, SOCIALLY and in every other respect if they would guard their health. With VIGOROUS HEALTH—a body full of ELECTRICAL ENERGY—a man can make OPPORTUNITIES if he don't find them, but lacking in the COURAGE and SELF-ASSURANCE that is born of MANLY VIGOR, he is but a derelict—a vessel without mast or rudder—cast hither and thither by every storm of life that besets his pathway. GIVE ME A MAN that has exhausted his VITALITY—suffering from PAINS AND ACHES—MENTAL DEPRESSION —SLEEPLESSNESS—NERVOUS DEBILITY—without HOPE—AMBITION — COURAGE gone — drifting with the tide—and I can transform him into a STRONG MAN—A man of push—a man that will make his way in spite of all obstacles—if he has anything left to build upon, and he will follow my advice and use the DR. McLAUGHLIN ELECTRIC BELT as I direct. Save your tobacco money for a few weeks—cut out a few of your health-destroying, soul-destroying habits—procure one of these appliances—USE ELECTRICITY, and use it in the right way to invigorate your body, and you will look upon the day you gave your case to me as the TURNING POINT OF YOUR LIFE. Here is what some say of this remedy, who have used it:

Dear Sir,—I am perfectly satisfied with your Belt for what it has done for me. I am now a well man.

Yours, very truly,
HUGH McLEAN.
New Glasgow, N.S., Box 464.

Dear Sir,—I find your Belt all right for every kind of pain that is felt in the human body, and I have not missed a day with sickness since I got the Belt.

Yours very truly,
JAS. W. BARRIE.
Auld's Cove, N.S.

Dear Sir:—

Having received a Belt from you some years ago, I now desire to express myself in regard to the benefits, which I received from it. I wish to say in as few words as possible that it was all that it was represented to be, having cured me of Indigestion and other ailments, and I must say that I feel a new man, and I give all credit to Dr. McLaughlin's Electric Belt. I would advise any one suffering to give the Belt a trial, and I know they will feel as I do. Although I have been four years benefited without saying so to you, I have been doing all I could in my locality personally. So giving you the privilege of using this letter as you wish, and wishing your Belt every success, I remain,

Sincerely yours,
SAM J. HARNETT.
North Gower, Ont.

Any man or woman who will give me reasonable security, I will send them the Belt, with all the necessary attachments suitable for their case, and they can

PAY WHEN CURED

Never mind waiting until you use the last dose of that bottle from the drug store. Begin now. Call and talk your case over with me or send for my book. It costs you nothing. For over 24 years I have taught the great truth that "ELECTRICITY IS LIFE," and have proved the soundness of my doctrine by making cures when others have failed time and again. Others have aspired to do the work I am doing with my ELECTRIC BELT. They offer you Electricity in some other form, or an "electric belt" that possesses no curative power whatever. They are like "boys on bladders" floundering in a sea of uncertainty—while to-day the DR. McLAUGHLIN ELECTRIC BELT stands the world over as the most correct—the most perfect—method of applying Galvanic Electricity to the body that has ever been devised. Call at once or send coupon for our FREE illustrated 80-page book, from which you can learn much that you want to know. Do it now.

M. K. McLAUGHLIN

and dish towels, oven towels, squares of cheese cloth, hand towels, floor cloths, things that were required every day about the sinks, tables and stoves and it meant much walking each day to get towels for different purposes. Can you you not see how many steps were saved by bringing the linen to the cupboard near the stoves and sinks and placing the glass in the far away cupboard.

I should like to hear some of you express your opinion on the convenient width of cupboard shelves. We have some wide-shelved supply cupboards and feel quite sure that they are not the best to have. They hold two rows of articles. The large things as flour and sugar tins are at the back, and smaller dishes as egg basket and butter dish are at the front. Now one wants sugar quite as often as they want eggs and every time we want to get sugar we must first move aside the egg dish. If we put the eggs at the back and sugar in front every time we want eggs we must move the sugar dish. The shelves are wide apart but in putting away the sugar or flour tin they are very apt to strike the shelf above and sometimes it proves trying to the temper. Can any of you give any decided opinion as to the advantages of narrow shelves over wide ones?

There are many phamphlets printed that contain suggestions concerning convenient arrangements of pantries, cupboards and kitchens. The Department of Agriculture at Washington, have some excellent articles and by writing to the Secretary of that Department one can obtain them, or by writing to Cornell University, Ithaca, N. Y.

The possession of that labor-saving device "common sense" is worth a good deal.

A lady had been invited with some other friends to take tea at two different homes. At one home the party saw but little of their hostess and her family until they sat down to a table, simply groaning under its burden of the good things of life, white and brown bread, biscuit, strawberry preserve, apple, mince and Washington pie, jelly roll, raisin cake, fruit cake, gingersnaps, cookies, doughnuts, turnovers, and the guests felt that they were expected to eat a portion of every one of these things. Well they did their best. The lady confessed that she felt like the little boy after his Christmas dinner, who said, "take I to bed but don't bend I." When the meal was finished the family were again busy putting away the remains of that feast, and the guests saw but very little of them.

The same lady was invited with a few friends to take tea at another home. Their hostess sat with her friends until a few minutes before they sat down to the table, when she excused herself to put her tea to steep, and her friends sat down to a daintily served, well-cooked meal of baked beans, brown bread and white, canned fruit, macaroons and hot, freshly steeped tea. After the supper the hostess was able to set her house in order in a very short time. She was not tired out and was able to enjoy the company of her guests for the entire evening, and they were able to enjoy her company, more especially as they realized that in giving them pleasure she had not over-taked her own strength.

Does true hospitality consist in tiring ourselves in order to feed our friends until they are uncomfortable.

In the mending to be done in a home is it good common sense to allow the holes in clothes and linen to become very large before mending them? If a stitch in time saves nine why not take that stitch and and save nine. If it were a dollar in time saves nine, do you think the dollar could be found?

At this season, the spring nightmare looms before the house-maker. I refer to house cleaning. The following conversation took place between two ladies. Don't you dread the awful house cleaning coming?" "No" replied the other "not nearly so much as I used to. You see as our carpets wore out we painted our floors, or put down hard wood floors and have a rug in the centre, and house cleaning is not half the work it used to be, when we had to take out tacks, roll up dusty carpets, spread them on the line and prop them up with a stick every time the wind blew them down, beat them clean and then get down on both knees and tack and stretch them into place. Then with the rugs or squares, we put one out on the line to let the wind blow through it, every month, and it keeps our house fairly clean all the year round."

Having a moderate amount of system in the keeping of everything in its place is an excellent labor saving habit. So much energy is used looking from one end of the house to the other for Johnny's cap, which he carelessly left out of doors.

Men are thoroughly up-to-date in supplying themselves with labor saving devices, none more so than the farmers. They have their binders, reapers, mowing machines, gasoline engines for pumping water for the cattle and other uses. Do we see as many labor saving devices in the homes, and if not why not? It may be that house conveniences are not so well known. May I mention a few that I know are worth having in every home. For the kitchen, the granite or aluminum utensils are much lighter to handle than the

$1,000 for a Coat of Paint

It seems hard to believe, yet that is the sum of money that a coat of *Martin-Senour Paint 100% Pure* added to the selling price of a certain house.

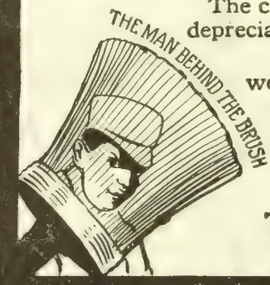
For several seasons, a shabby weather-beaten house had been offered for sale. There were no buyers until a shrewd real estate broker purchased the property and, with a single coat of paint, magically changed it from a shabby house to that of a home of dignity—a home of comfort and elegance; furthermore, he sold it within a very short time clearing $1,000.

Nothing so preserves and maintains the value of your property like

Martin-Senour Paint 100% Pure

whose mission is to paint your buildings uniformly, economically, safely and surely.

The coat of Paint made the sale. Don't let your property depreciate in value for the need of paint.



If your dealer cannot supply you, notify us and we will gladly direct you to where our paints are to be had.

Pioneers Pure Paint

Only The Best Seeds Are Worth Planting

It's a positive waste to take good land, whether in field or garden, and handicap it at the start of the season by planting poor seeds.

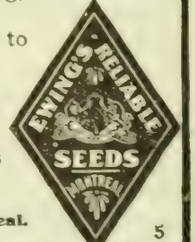
Even if they do cost a little less than Ewing's, the amount saved will be lost several times over in the smaller crop you'll get.

Ewing's Reliable Seeds

instead of the doubtful kind will often mean double the crop—a good profit over the cost of growing, instead of a loss.

Ewing's seeds are perfectly clean, true to type, strong, healthy, and, under proper conditions, sure to grow.

Write for our Illustrated Catalogue and look it over carefully before planting time. Then if your dealer hasn't Ewing's Seeds buy from us direct.



Wm. Ewing & Co., Seedsmen, McGill St., Montreal.

GAS ON THE STOMACH

Relieved at Once by Father Morriscy's No. 11 Tablets.

Many people find that no matter how carefully they watch their diet and deny themselves this, that or the other favorite dish, still after every meal gas forms in the stomach and everything seems to turn sour.

Besides causing great discomfort, this condition makes it impossible to get the full benefit from the food eaten, and the body is continually starving with a full stomach.

Father Morriscy's No. 11 Tablets promptly relieves this and other stomach disorders. Each Tablet has the power of digesting a pound and three-quarters of food, so that even though the stomach may be in a very bad or weakened condition one tablet taken after each meal will insure proper digestion and prevent sourness, gas in the stomach, pain or discomfort.

The case of Miss Maggie Leahy, of West Franklin, Ont., is a sample of what Father Morriscy's No. 11 Tablets can do. Writing on Jan. 5th, 1910, she says:

" Your No. 11 Stomach Tablets suit my case exactly, as I am ever so much better since using them than I had been for the last seven years. I could hardly eat anything that would not turn sour on my stomach, or cause gas. My Doctor said it was Catarrh of the Stomach. I had no pain, but gas after eating. The first tablet I took gave me relief, and I am still continuing their use."

If you happen to eat a little too much for dinner, or something that does not agree with your Stomach, just take a No. 11 Tablet and you will feel all right in a few minutes.

If you have been troubled with Indigestion or Dyspepsia a course of Father Morriscy's No. 11 Tablets will soon put your stomach into a healthy condition again.

heavy iron pots; a pot holder with tape attached pinned at the waist saves many steps on baking day A sink with drain pipe and pump. And linoleum for the floor, which can be kept clean so easily by using a mop, a bucket of warm water with one-half cup of kerosene.

There are a number of washing machines on our market. Some are really excellent, especially so for washing blankets.

For the daily cleaning of floor rugs, a carpet sweeper is excellent, but it does not take the place of a broom, as one cannot use it for the corners and close to the walls.

I have been asked by several about the bread mixers. In some cases ladies have told me they could not use them as they did not like them. Others have said they would not be without one. I know of one maid who makes excellent bread, as good as I have ever had, and she uses a bread mixer. It certainly saves a great deal of work to use one.

At a Women's Institute Meeting in Ontario, a gentleman told a story that always comes into my mind when I see the phrase, "labor saving device." It was of a woman who worked hard, and was proud that she worked hard. She was anxious to swell the family bank account, and to help her husband, so she scrimped and saved, got down on her knees and scrubbed the bare floor of the kitchen, did the fami,y sewing by hand, carried water from a spring and even brought in the wood. She kneaded the bread and did the numberless things that must be done in a home. She never dreamed of getting a sewing machine or carpet sweeper, or any device that would save her strength. She took no time even to read about them. In time this human machine wore out, she could easily be replaced. As a final incident of her life the husband bought a tomb stone for her grave. Being very narrow it was less expensive and for that reason he decided it would do very well. He directed the stone cutter to carve the name, and below it these words. "Lord she was thine." When the neighbors went to see it in its place it was found that the stone was a little narrow, and the inscription read, "Lord she was thin."

Let us sum up the points of discussion. Do not worry. Rest or sleep an hour each day. Use body intelligently. Use common sense. Use system in the nome and use all labor saving devices that you can afford.

An address by Miss Grace Dutcher, Household Science Instructress at the Prince of Wales College, Charlottetown, P. E. I., before the Ladies Institute Summerside.

Bonusing the Dairy Cow.

Editor Maritime Farmer:—

I was much interested, while at Fredericton, by hearing Mr. Schofield, explain some of the details of the scheme for the proposed bonusing of the dairy cow.

I believe he has a sound idea, and one that would do more good for the money invested than if spent on the bonusing of the common mercantile machinery.

The only drawback that appears to me is the difficulty of getting our government to increase its grant, from the present princely sum of ten thousand dollars, to an amount that I believe Mr. Schofield gave us roughly as three hundred thousand as its first item.

They do not dare to tackle the "cratur", they are paralized by its size.

In the meantime, we must if possible, do something to get a move on the cow with a little less expense.

One of the arguments against the bonus scheme would be, that the man that tests his cows gets his reward without any bonus. The answer of course is that it is the three thousand pound cow man that we wish to get to sit up and take notice.

Granted, then, that it is the unprofitable cows that we wish to

Simmers' Seeds.

Complete Vegetable Garden Collection.

Contains 25 packets of the best Vegetable Seed, sufficient to furnish vegetables throughout the year, and one packet of Flower Seeds, which we will send postpaid to any address in the Dominion of Canada for the extremely low price of **$1.00.**

Bean—Simmers' Giant Wax.
Beet—Blood Turnip
Cabbage—Vandergaw.
Carrot—Scarlet Intermediate.
Celery—White Plume.
Corn, Sweet—Cory.
Cucumber—Chicago Pickle.
Cucumber—Long Green.
Lettuce—Simpson's Early.
Muskmelon—Montreal Green Nutmeg.
Watermelon—Cuban Queen.
Onion—Yellow Danvers.
Onion—Prizetaker.
Parsley—Champion Moss Curled.
Parsnip—Improved Hollow Crowned.
Pepper—Sweet Spanish.
Peas—American Wonder.
Peas—Stratagem.
Pumpkin—Mammoth.
Radish—Scarlet Turnip, White Tipped.
Salsify—Mammoth Sandwich Island.
Squash—Summer Crookneck.
Squash—Hubbard.
Turnip—Purple Top, Strap leaved.
Tomato—Early Ruby.

And packet Wild Garden Flower Seed Mixture. Also a copy of Simmers' Vegetable and Flower Garden (New Edition), and a copy of our handsome **1910 Seed Catalogue,** which, in itself, is a mine of valuable information. Don't miss this.

More bread and Better bread

——And the Reason for it

A STRONG FLOUR can only be made from strong wheat. Manitoba hard wheat is acknowledged the strongest in the world—and that is the kind used for Purity Flour.

But that's not all. Every grain of this wheat contains both high-grade and low-grade properties. In separating the high-grade parts from the low-grade the Western Canada Flour Mills put the hard wheat through a process so exacting that not a single low-grade part has the remotest chance of getting in with the high-grade.

Of course this special process is more expensive to operate but it means a lot to Purity flour users—that's why we use it.

It means that Purity Flour is made entirely of the highest-grade flour parts of the strongest wheat in the world.

It means a high-class, strong flour and therefore yields "more bread and better bread."

Purity may cost a little more than some flours, but results prove it the cheapest and most economical after all.

reach by getting their owners to find them out, is there not some way that the scheme can, at least, be started with a little less grease?

I was much pleased with what Mr. Good said to us regarding the Dominion Exhibition. He did not appear as the man with the swelled head that knew it all, but is ready to have any feasible scheme submitted for his consideration.

I would suggest that prizes be given to the dairymen who, by keeping records, of the productions of their herds and the cost of feed, between the first of April and the first of September, 1910, and who in the opinion of the judges, do most to benefit themselves and their neighbors.

I would suggest that before starting the test each man put a price on each of his cows for future reference.

In my opinion, the strong point about this scheme is that it would not be the man with the good cows you would be stimulating so much as the owner of the poorer ones, for it is the man that finds out his non-paying boarders that will be helped the most.

In the poorest herds, there are usually a couple of fair cows, that may be used as a foundation for breeding.

I would suggest that this competition be divided into two classes. First, to those who have been keeping records and the other those who have not. Let the prizes be liberal enough to amply reward a man for his trouble, even if he did not get far greater returns from knowing his cows.

What better educational feature could we have at the Dominion Exhibition, than two cows from the herd of each of the prize winners in this competition that to the average buyer would be about of equal value, but the one being maintained at a loss to her owner and the other paying him a good profit.

CHAS. PETERS.

Kings Co., N. B.

A Stranger Does Well Under New Brunswick Conditions.

Editor Maritime Farmer:—

Last June, I arrived in this country an utter stranger as to its condition, and got settled with Mr. Peters, of Elmhurst, Kings Co., N. B. I find I am able to make a living, do the work and give satisfaction. Mr. Peters tells me "this part of the country, with the exception of being situated near the St. John market does not compare favorably with the Province in general, from an agricultural stand point." I believe money is being made by the small farmer who is up-to-date.

Mr. Peters says, "the greater part of the Province has as many natural advantages as Ontario," where many of my countrymen are making a splendid success of stock raising and mixed farming. He says that, "taking it for the whole year, and the cost of living into consideration, the wages of a laboring man in this Province compares favorably with the West." Of course I have only his word for it, and he would naturally be inclined to prejudice. I think what is bringing the Scotch people out to Canada is the idea of bettering their conditions generally and getting homes of their own.

Like all other classes of immigrants they are going to what they believe to be the best country for them. I would like to get the opinions of other readers on this question. Let us discuss it for the benefit of employers and employment seekers.

JAMES TORRANCE.

Four minute Records for the Edison Phonograph

When Mr. Edison invented the Amberol Records he invented the longest Record ever made for a sound-reproducing machine. But the Amberol Record is not only longer; it is better. It is made from a new composition which makes a more perfect reproduction of music or the voice than any known method.

An Amberol Record in an Edison Phonograph is the most perfect reproduction of a song or a piece of instrumental music that you have ever heard.

But do not accept our statement. Go and hear it. There is a dealer near you. Hear the Edison Phonograph and compare it with other instruments before you decide. We will leave it to your judgment as to whether you can buy anything for the price that will give you so much real, genuine fun and pleasure as the Edison Phonograph.

Edison Phonographs - $16.50 to $162.50
Edison Standard Records - - .40
Edison Amberol Records (twice as long) .65
Edison Grand Opera Records - - .85

There are Edison dealers everywhere. Go to the nearest and hear the Edison Phonograph play both Edison Standard and Amberol Records. Get complete catalogs from your dealer or from us.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day as you may not see this offer again. Address:

Special vs General Farming

A great deal has been said and written on agricultural problems,and in the natural course of events, always will be, so long as we possess individuality.

It would seem that the man, the soil and location must determine the advisability of special farming. If you have a city market at your door or surrounded by vast areas of marsh lands, meadows or intervals, that can be kept in good fertility by nature's work supplemented by man's common sense, we can conduct our farms on very different lines, that, generally speaking, cannot be applied throughout the Province. If there is one thing more than another that is being demonstrated on our average upland farms it is the economic principle of keeping our land in as thrifty condition, as our well kept stock.

The farmer who is making hay, grain or potatoes a speciality with commercial fertilizer, has perhaps met with a certain degree of success, but perhaps in years when hay was low managed to just balance accounts, and in years like the present when potatoes will hardly pay for the digging, will probably have to draw on his bank account, if he has one, to make ends meet. But we cannot grant that the farmer who is satisfied with just a living,no matter to him how he leaves the fertility of the soil, has been aiming at the highest principles of agriculture. If there is a profit in producing the raw material, there ought to be another profit in manufacturing it into a finished product, thus making our God given land doubly productive.

I believe in specializing, but not in the sense that the term "special" is understood in our discussion. Each locality according to its soil, climate and market opportunities should make that branch of farming that is best suited to that section, its main standby.

Suppose we are compelled to cart our produce four or five miles to a station and spend the day making two trips. Would it not be more profitable to utilize our time and horse flesh in hauling back to the land the manure, a gathering of one of the by products of our stock, which has also produced the finished article of butter, or butter fat, beef, steers, sheep, horses and pigs, yes and poultry which can be marketed for one-hundredeth part of the cost.

This brings us to general farming, which is one of very wide appreciation and may cover every branch of agricultural industry. It must in this Province, with its varied soils, and differently located farms, include a great variety of ideas, systems and methods.

We hear the argument used against general farming, that in our rush to attend to everything we neglect to give our best attention to any one branch, but right here is where individualism comes in.

The cow, let her be the dual purpose, or the pure-bred beef type, or of the highest milking type is the backbone of the general farm.

One farmer will take the dual purpose cow whose combination of milk and beef production should be blended somewhat towards a milking strain, he uses a hand separator and ships the butter fat to a creamery (where every farmer ought to ship it), and feeds the skim milk to the calves and pigs. The calves at one or two years old bring him a nice figure, the pigs six or seven months old, which have been allowed to forage in a clover patch, adds another bulge to his purse. In the meantime the soil fertility has been increased. No cradle hills or bushes in this man's pasture land, nor bulls eye for timothy and clover in his mowing fields. He ploughs often and plans to have the roots and corn on a clover sod and with plenty of barn yard manure, he will have no cause to worry about the weather. A few more potatoes is raised than will be needed if the market warrants their sale, if not they make good feed. With the feeding of all the hay and all the roughage on the farm, this general farmer is enabled to grow most all the short feed needed. The grocery and meat bills are met from the poultry yard. The profit from the strawberry patch, and other small fruits, will usually more than pay the wages. His draught work has cost him practically nothing, for this man is raising heavy draught colts as a side issue, and perhaps working three or even four of them together to do the work of an older team. They are growing and developing and as near maturity as possible, he is wise enough to sell, if not for what he asks, for what he can get.

Let us for a moment turn our attention to the dairy cow. There are three ways of marketing her milk: First, by selling all the milk to city customers. Second, to separate the cream and send to the Factory. Third, to manufacture into butter at home. In the last two places the pig must have an important place in the management, and thus the farmer is compelled to come back to general farming.

In the first instance the man who sells all the milk, saves the expense of separating the cream and manufacturing it into butter, his main object, no doubt, has been to produce a large flow of milk, regardless of its richness in butter fat. His herd has been closely watched and probably examined for disease. The milk must come up to the standard required by the law laid down by the city board of health, and while the comparison between the price for the milk sold and the price for the butter fat seems greatly in favor of the man who is selling the milk, his success depends upon the intelligence with which he has fed and cared for his cows, so as to produce the greatest yield of milk, marketed at the lowest cost, and last but not least, the progressiveness of the city and its surrounding country.

Another farmer will make a specialty of pure bred beef cattle, Durham or Hereford or some other beef type, and plans to profit by their superior breeding. Usually the calf is allowed to run with the cow, thus the profit from the milk must be looked for in the calf. Practically speaking, the only profit from this pure bred cow is her calf. Now it has cost as much to keep this cow as it has the dual purpose cow and without going to the figures and without allowing interest on the extra value placed upon the purebred the value of this pure bred calf must be placed against the by-products, less the extra work connected with the dual purpose cow. It is well known that even well bred stock does not always produce the quality expected. Should this happen it is worth only its beef value in the market. This farmer has sold nothing from the farm except the pure breeds. In this case his success depends upon his ability to make the farmers of the Province believe that it will be better for them to pay him his extra price, rather than to keep their grades.

Now what about the pure bred draught horse? If it is needful to keep the desired object we wish to attain, well in view in the breeding of our cattle, how much more,should a distinct and well defined purpose dominate our course in the desire to produce a first class specimen of a far nobler animal. Almost up to the last two or three years, the majority of the farmers have not realized this, and consequently a large number of draught horses are being imported to meet the demand. A few years ago an enterprising business man from our section went to Scotland and brought out a splendid type of a draught Stallion, and while he made the service fee comparatively small, only a few patronized him, because they could secure the service of a mongrel for less money. But as time went on, his progeny, from the grade mares, produced good colts in almost every case. This enterprising man, (per-

Montgomery, Ross & Co.,

Box 110, Station B., Montreal.

haps at a loss to himself) saved the horse situation in our district. We now have a splendid class of brood mares which are proving a source of income to our general farmers. But the farmer who undertakes to make the breeding of pure bred horses his main income, must be wealthy to start with, which will bar the most of us. It will cost more to raise them because there are not the same opportunities of making them earn their living in this mode of farming, as in general farming. All horses are liable to accidents and liable to go lame most any time, which will lessen their value, besides the market is limited for pure breds unless the progeny of the pure bred mare will make a much better work horse than the colt of the grade mares, it would seem unprofitable for many to make a specialty of pure bred horses.

There are many other branches that may be taken up in this discussion, but I have stated the most general ones, in as concise form as possible, for any one of the branches mentioned would afford material for an evening's discussion.

In conclusion let me say, that with our splendid educational facilities, and our Agricultural literature that is accessible to every home in the province there should be no excuse for a farmer not keeping abreast of the times.

Our farmer should be a student of general knowledge, studying with clear insight, crop statistics, market reports, supply and demand, both local and foreign, that he may market his products when they will net him the largest returns for farming is a business proposition pure and simple. The general farmer who has done this is enabled to meet any market condition, and if he has attended strictly to details in production, I care not whether he be a specialist, or a general farmer, he is solving the problem of successful agriculture in New Brunswick.

Paper read by Fred C. George, Sackville, before the recent New Brunswick Farmers' and Dairymen's Association.

Building up an Old Farm.

A Subscriber, Mt. U., N. S.—"I am trying to build up an old farm. I have been buying commercial fertilizers for raising oats and feeding oats, hay and other millfeeds to stock and spreading the manure on grass lands. W

Can I enrich the soil as well this way as I can by spreading manure on the oat ground and harrowing it in?

One objection I have to spreading the manure on the ground is that it makes the straw too heavy and it falls before the grain is ripened and again it takes up time in the spring just when we are busy with our work.

Would Nitrate of Soda and Land Plaster make good fertilizer?

As a plan to build up a farm I consider the scheme outlined defective. A much better plan would be to follow a short rotation on the best of your land, gradually bringing more land in till as much land as desired for cropping purposes were under the regular crops of the rotation.

As the most suitable rotation to follow I would suggest one of three or at most four years duration. The better would be a three-year rotation including one year roots, one year grain and one year clover hay. If absolutely necessary the field in hay might be left another year having prepared for this contingency by seeding timothy at the same time as to clover 10 lbs. clover, 12 lbs. timothy per acre.

In answer to specific questions I would say:—

1. Yes, putting manure on meadow is a surer way of getting returns in crop and soil improvement than is the applying of it to grain crops.

2. I would use land plaster very sparingly. In fact only when seeding down to clover use say 150 lbs. per acre. Nitrate of soda is a good fertilizer.

An Irish Priest's Suggestion.

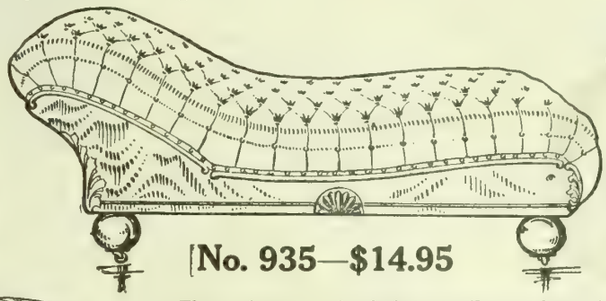
"From the Rev. Thomas P. Hurley, a parish priest of County Cork, has come a suggestion which the Department of Agriculture,, N. S., will exploit during the coming year. According to Father Hurley twelve farmers placed in his hands the equivalent of $1, and with this money he purchased twelve excellent books on agricultural and horticulture. As these people lived near each other it was easy for them to use each other's books, andthus for $1 the little community each year was able to get a dozen excellent works the last word on the scientific development of farming.

"Secretary Wilson proposes to place orders with country doctors as well as with priests and clergymen. He will keep the heads of these distributing centres informed about the latest books which can be recommended, and from the large supply of free matter he distributes will give a generous quota to such communities as are getting together an agricultural library. Mr. Wilson believes in the co-operation of the farmer and his wife with other farmers and their wives and an exchange of ideas. He also would like to get established a literary bureau in his department which would receive and answer letters pertaining to farming subjects. New ideas which have proved successful could be passed on from one community to another. In the forthcoming recommendation Mr. Wilson calls attention to the fact that in Ireland the priests keep abreast of the times on new inventions and the best methods of farming, and that every priest's home contains agricultural and horticultural books which are consulted freely throughout his parish. He would like to interest American clergy in the good work of making better farmers out of their flocks."

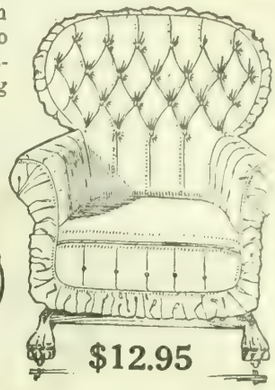
Remarkable Values in Furniture

Just look at these three pieces of furniture—have you ever seen such wonderful value ? We are offering these pieces at these very low prices to introduce our large illustrated "Catalogue No. 8 500 photographic illustrations of the newest furniture are shown in this catalogue. It's a big book full of big bargains. You ought to have it.

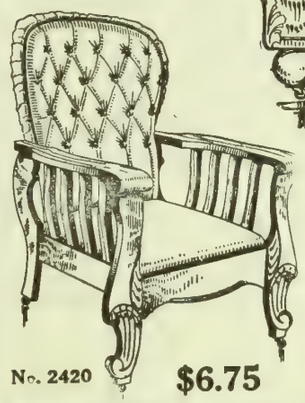
Catalogue is Free for the asking.



[No. 935—$14.95



$12.95



No. 2420 $6.75

These pieces are in design exactly as shown in the cuts. The Morris Chair (No. 2420) has solid quarter-cut oak frame, upholstered spring seat and adjustable back. Couch (No. 935) has quarter-cut oak show-wood frame, neatly carved, heavy ball feet, full spring edge and deep spring construction, button tufted—a luxurious piece of furniture. The large Turkish Rocker is all-over upholstered with buttoned back, ruffled border and spring seat, mounted on spring platform rocker, base of solid oak.

Each of these pieces is covered in best quality moroccoline—an imitation leather that will wear like iron, and can only be told from the genuine leather by an expert.

We guarantee every article as represented or will refund your money if you do not find them so.

Seed Selection as Practised in Europe.

(Continued from page 365.)

from crossing artificially, after the type has been fixed, are each planted in a drill. The rows—each row representing the product of a single plant—are seven inches apart and planted to correspond as nearly as possible to field conditions, both as to soil and thickness of seeding. From the crop so produced, it is ascertained whether the type in each row is stable and also which of the individual rows have produced a progeny most nearly to the ideal desired. The few superior rows of plants are then increased on larger plots for further comparison and estimate as to yield. All the plots were completely surrounded with a strong-strawed variety of rye of dwarf habit of growth.

One or more of the most promising of these increase plots are again sown on still larger plots, also surrounded by rye, from which larger plots, more accurate determinations are made as to yield, strength of straw, quality of grain, rust resistance and maturity. Collateral tests are also made on lighter soils near Malmo and at the sub-stations 5 and 10 degrees north.

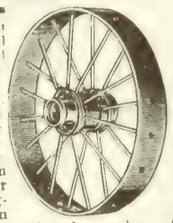
Our farmers who have been making a specialty of growing and selecting seed wheat, oats and barley would no doubt welcome any modification in the regulations of this Association, that would relieve them of some of the careful work that is now required of them at a busy season of the year. Perhaps very few of them would take kindly to additional work such as Prof. Nilsson is doing. But I would suggest that this Association gradually incorporate into its regulations the best part of Prof. Nilsson's method. I would strongly advise that the Association undertake, so far as it may be able, to provide members, particularly new members, with the best possible foundation stock that has been produced from an individual plant of outstanding merit.

My remembrance of that old adage, "Prove all things, hold fast to that which is good," precludes me from releasing growers of registered seed, under our conditions and careless practices in handling cereal crops in Canada, from the system of continued selection from year to year. To maintain the purity of variety and type, if for no other reason, the breeding plot, or "hand-selected seed plot" should be maintained. If, as Nilsson and other European breeders contend, the nature and amount of varieties from an individual plant is so small from year to year, that even specialists are scarcely able to take advantage of it to secure further improvement, then this Association might very well allow its members who are growing wheat, oats and barley to take their crop from their hand-selected seed plots into their barns and select from the sheaf on wet days and thresh by hand enough good, pure seed to sow a quarter acre, or even a two or three acre plot, which should be continued from year to year as a base of supply of pure seeds. That would relieve seed growers of their principal excuse for not continuing with the selection according to the present requirements.

It seems to me, and in that particular I think I have expressed myself at the last two annual meetings of this Association, that the work of isolating these individual plants of merit can best be done by men who spend all or nearly all their time in a study of the characteristics and capabilities of these plant units of one or two kinds of crops. It is true that there are some farmers who are now making a specialty of growing seed and who not only have the ability but will find the time and adopt the proper methods to produce new sorts from individual plants of merit which they may discover. But this is a work which our farmers have a right to expect of the experts who are employed by the Federal and Provincial Governments or other institutions.

An address by Geo. H. Clark, Seed Commissioner, Ottawa, before the Annual Meeting of the C. S. G. A.

The wide tires on Dominion Low Steel Wheels save roads and make hauling easy. Won't rot, like wooden wheels, are stronger and guaranteed not to break in rockiest road or coldest weather. Can be taken apart and repaired. No boxes in hubs to become loose or break. Lighter, stronger and cheaper than wooden wheels. Make work twice easier.



The Dominion Low Handy Wagon saves labor and time, and makes loading and unloading easy. Does away with high lifting, enabling one man to do work of two. Easily changed into platform wagon. Parts arranged for easiest draft. Wide-tire low wheels make pulling easy. Guaranteed. Send for free catalogue on Handy Wagon and Dominion Steel Wheels.

"Gold River Farm," Loch Lomond West, Richmond Co., N. S.

PREPARE NOW TO MAKE EVERY MINUTE COUNT AT HARVEST TIME

FOR you must make every minute count then to be sure of getting the full profit from your acres. Smooth, rapid, uninterrupted work is a necessity when the grain is ripe for cutting. Every delay due to a slow, inefficient broken-down machine will rob you of a part of the reward you have a perfect right to expect.

You have used great care in preparing the ground—sowing the seed—caring for it while it is growing.

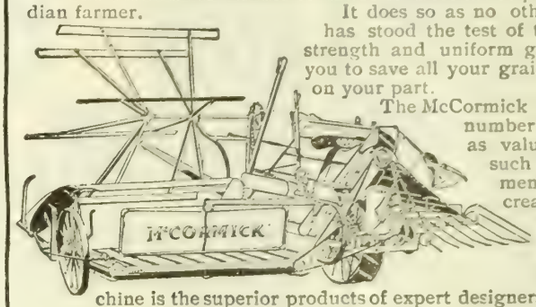
Don't, through lack of foresight now, run any risk of making valueless at harvest time the hours of labor spent in preparing for it.

Be prepared to get all the crop with a McCormick.

Your grain may be tangled or down.

It does not matter, a McCormick Binder will pick it up quickly and bind it in the best possible shape.

The McCormick Binder is made to meet the requirements of the Canadian farmer. It does so as no other machine does. It has stood the test of time. Its light draft, strength and uniform good work will permit you to save all your grain with the least labor on your part.



The McCormick line embraces a large number of other machines just as valuable as the binder, such as drills, tillage implements, gasoline engines, cream separators, wagons, hay presses, manure spreaders and motor vehicles.

Every McCormick machine is the superior products of expert designers and skilled workmen.

Look over your machines today. See what you need to properly handle the harvest this year. Then call on a local dealer or write direct for further information. Take the step now that will insure your getting all the profit from your harvest.

Has a World Wide Reputation as THE STANDARD ENGINE.

THE GILSON ENGINE is the highest development of gas engine construction. It is the result of tireless INVENTIVE INGENUITY, RIPE EXPERIENCE, and a fixed purpose to produce the BEST THAT IS MADE.

THE GILSON ENGINE incorporates the best features of all foreign and domestic engines, and besides possesses distinguishing features not found in others.

THE GILSON ENGINE is noted for Reliability, Power and Durability. It will last indefinitely with ordinary care and be a constant source of satisfaction.

THE GILSON ENGINE is most ATTRACTIVE in APPEARANCE, EASY to OPERATE and VERY ECONOMICAL.

Our reputation for producing the highest grade engines, for fair dealing and liberal courteous treatment and Low Prices, is one of our most valued assets.

Ask for our large Catalogue; get our prices; compare Engines and Prices and you will decide in favor of the Gilson Engine, because it is the BEST and CHEAPEST as well.

Do not allow a dealer or agent to sell you another make that is "Just as Good" as a "GILSON." Insist on having a "GILSON" and you will never regret it. Your dealer or agent makes more money by selling you an inferior machine, but what he makes, you loose.

Remember we absolutely guarantee every engine we produce.

Possibilities of Fruit Crowing in the St. John Valley.

Fredericton, N. B., Mar. 24.—The members of the Legislature had a practical and impressive demonstration this week of the possibilities of the St. John River Valley as a fruit producing section. On Wednesday afternoon as the members entered the Assembly Chamber each found upon his desk a plate of apples, tempting in appearance, delicious in flavor and generously distributed. A ticket beside each plate bore the legend, "St. John River Valley Apples from the orchards of James P. Belyea and George McAlpine, both of Lower Gagetown, Queens County. Compliments of A. R. Slipp, M. P. P." On the Speaker's table was a particularly attractive plate of six large McIntosh Reds, the fruit which at the present time is selling on the London market at ten cents apiece.

The display comprised specimens of MacIntosh Red, Fameuse, Bishop Pippins, Baxter, Ben Davis and Northern Spy. The fruit although kept in only an ordinary cellar was firm, yet mellow, and was of delicious favor. In all some sixty plates were distributed and the display was very highly commented upon. It was really instructive to many of the members, who while passively assenting to the optimistic statements of those who predict a great future for New Brunswick as a fruit producing province yet have but slight personal knowledge of the possibilities in that direction. This action of the energetic member for Queens, coupled with the activity manifested by the Provincial Horticulturist, will materially advance the fruit production in the immediate future. If the approaching season is a favorable one for apple growing the Fruit Exhibition to be held in St. John next fall will surprise the world, both as regards quantity and quality of the displays.—Moncton Times, Mar. 29, 1910.

To Prevent Horse from Gnawing Rope.

I have found that by painting the woodwork with coal tar the worst wood-gnawing horses would never bite it afterward. The tar should be put on while hot. An old broom or whisk brush may serve as a paint brush. I have also found a way to cure a horse of biting his halter strap or rope by boiling the rope in water in which a bar of cheap washing soap has been dissolved. This remedy tried on several horses which I have owned never failed. One horse, when I first got him, would bite a heavy rope in two almost as soon as tied. A small soaped rope cured him completely. That was nearly ten years ago and it has not been necessary to tie him with a chain since.

Oil Meal for Calves.

Subscriber, N. B.:—How should oil meal be prepared to get the best results when fed to calves? Please answer through your most excellent paper.

Answer.—Oil meal may be fed to calves in its finely ground condition, or, what is better, the oil cake ground coarsely and sold under the name of pea size oil cake. The latter is less liable to be adulterated and can be fed to better advantage. It should of course, be thoroughly mixed with other grains and care must be taken that it is not fed in excess. It would be safer to give the calves at first not more than one-fourth pound each per day.

MOVING PICTURES
OF DAN PATCH 1:55

ABSOLUTELY *FREE* POSTAGE PAID

If you are a Farmer, Stockman or Poultry Raiser and correctly answer, in your postal card or letter reply, the specified questions.

THIS IS THE LATEST SENSATION AND GREATEST TRIUMPH IN THE GREAT MOVING PICTURE ART.

It is a *New Invention* that you can carry in your pocket and show your friends instantly, day or night, either once or a hundred times, and without a machine, curtain or light. It is the first successful moving picture ever taken of a World Champion Horse in his wonderful burst of speed. The original film contains

2400 INSTANTANEOUS PICTURES OF DAN PATCH

and every picture shows the King of all Horse Creation as plainly as if you stood on the track and actually saw Dan Patch 1:55 in one of his thrilling speed exhibitions for a full mile. 2400 distinct moving pictures taken of Dan in one minute and fifty-five seconds means twenty-one pictures taken every second all of the way around the entire mile track from the back seat of a high power automobile. You can see Dan shake his head to let his driver know that he is ready for a supreme effort and then you can watch every movement of his legs as he flies through the air with his tremendous stride of 29 feet. You can see his thrilling finish as he strains every nerve to reach the wire, you can see his driver dismount and look at his watch while thousands of people crowd around, you can see his caretaker force his way through the crowd and throw a beautiful woolen blanket over Dan to prevent his catching cold and then you can follow him up the track before the madly cheering multidudes. As a study of horse motion it is better than the actual speed mile because you can see Dan right before you for every foot of the entire mile. When first shown to the public this marvellous picture caused people to stand up all over the theatre calling "Come on Dan"—"Come on Dan."

This remarkable moving picture is the most realistic and the most thrilling ever presented to the public.

We have taken a part of these 2400 wonderful and sensational pictures and made them into a *Newly Invented Moving Picture* that you can carry in your pocket and show to your friends at any time, day or night. It does not need a machine, it does not need a curtain and it does not need a light. It is all ready to show instantly either once or a hundred times and creates a sensation wherever shown.

THIS MOVING PICTURE WILL BE MAILED TO YOU ABSOLUTELY FREE, WITH POSTAGE PREPAID, IF YOU ARE A FARMER, STOCKMAN OR POULTRY RAISER, AND CORRECTLY ANSWER THE THREE QUESTIONS.

YOU MUST ANSWER THESE 3 QUESTIONS IF YOU WANT THE MOVING PICTURES FREE

1st. In what paper did you see my Moving Picture Offer? 2nd. How many head each of Horses, Cattle, Sheep, Hogs and Poultry do you own? 3rd. How many acres of land do you own or how many acres of land do you rent?

I will not mail this wonderful moving picture of Dan Patch 1:55 free unless you are a Farmer, Stockowner or Poultry Raiser and unless you correctly and honestly answer the three questions.

IF YOU ARE NOT A STOCKOWNER AND WANT THE MOVING PICTURES SEND ME 25 CENTS.

In silver or stamps to pay postage, etc., on Moving Pictures. I will mail this wonderful Moving Picture of Dan Patch 1:55, the fastest harness horse the world has ever seen,—to you if you send me Twenty-five Cents in silver or stamps even if you do not own any stock or land. It costs about $2700.00 cash to have one of the original pictures taken and reproduced. ☞Write me to-day so that you will be sure to secure one before my supply is exhausted.

We Want Beef.

(Continued from page 366.)

tween the turnip field, the feeding stock, and next year's turnip crop. As a general rule, it is better to improve the farm by buying feeds, than by buying commercial fertilizer.

Much is lost by improper care of manure. It should not be allowed to heat, but should be drawn out on the land as soon as possible.

One advantage our country offers for the raising of beef, is the large area of fair to good pasture, to be found in the meadows, swails and commons that is not easily available for any other stock, except young cattle.

I believe young stock will do better to be turned out as soon as the weather will permit in the spring, providing always, that they are not exposed to cold or rain, and have plenty to eat. Young cattle on rough pasture and brouse, will eat readily, feed that is not palatable, when fed in the stable.

By turning out as early as they can be comfortable, they are not subject to the effect of the sudden change, they are when kept in the barn until the feed is so they can readily gorge themselves; and they are not as sensitive to the flies and mosquitoes.

Young stock should be housed early, and not subjected to the cold storms and sudden changes our fall weather brings.

There is but little nutriment in frozen grass. It should be the aim of all owners of young stock to have them come into the barn in good condition.

The temptation to after feed closely should not be yielded to, as a general thing. There are several cheap fall fodders that may be easily provided to suppliment the pastures when they loose their succulence, such as a patch of white turnips, corn and rape. Then the turnip tops furnish a lot of good feed, not suitable for the milch cow except when fed with care and moderation.

Cattle have large stomachs and plenty of them; so it is not necessary to feed often or to disturb them during the night with a lunch.

I believe two meals a day are enough. I do not mean all an animal can eat. should be dumped into its manger at one time but feed hay or straw first, when the animal has eaten this, water, taking for granted water not being in the ordinary barn, the animal has to be turned out, when it comes back into the barn feed more hay. After it has eaten all it wants, clean its manger out, and give it roots and grain feed. This may be a feeding of two or three hours, but should result in the animal being thoroughly satisfied, and with a comfortable stable should soon be resting easily where he may be left until late in the afternoon when the same proceedure may be repeated.

When roots are fed plentifully it is not necessary to water more than once a day. Laziness is a virtue in fattening animals. Keep the stock comfortable, and do not disturb unnecessarily between feedings.

The producer should always have the ideal type of beef animal in mind and aim as far as he can to attain it. The animal with a short and broad head, open nostrils, large mouth, strong jaws, all indicating health, strength and capacity; short chest wide and deep, short legs, width without coarseness, with straight upper and lower line, hind quarters long and well filled, the whole outline of the trunk or body proper forming a parallelogram."

The time for marketing the beef animal should be controlled by the conditions surrounding the producer; if provided with much good pasture and limited feed for winter, it may be advisable to sell in the fall; if on the other hand the winter fodder is more plentiful than pasture, they may be more profitably marketed, during the winter, spring or early summer when the price is highest. They should be most profitably disposed of at from two to three and a half years old.

Farmers should do their own thinking, study their own peculiar circumstances, and allow their neighbors the same privilege.

Much is lost to the farm in man and method, by fathers not encouraging a spirit of prudent experimting among their boys. M

Careful thinking and investigating conditions will result in much satisfaction and some good to the boys. And when some fine morning the young farmer turns out for market a bunch of well-shaped, well finished steers, he will wear a smile that does not have to come off, and he will enjoy a satisfaction that the town workman, the manufacturer, or the man in the office does not have over his finished work. He will know a true, deep satisfaction and feel the dignity and pleasure of his vocation, as not only the equal but the superior of some possibly more remunerative occupations.

Most of the farms vacant or for sale to-day, are the ones that crops have been sold from. The farms where the crops were manufactured into the finished product of the dairy, beef, pork, poultry and the like are the farms where the farmer spends his last days under his own roof. "Where peace and plenty sit as guests, beneath the farm house shade."

I think it is a pitiful sight to see an old man, sitting on the banking of a rented house, dreaming of better days and seemingly waiting for death's evangel to bring release, when his last days should have been his best.

And his children who are responsible for the condition are servile to the shrill tones of the factory whistle, when they might have been workers together with God and nature and have had a claim on the world's best.

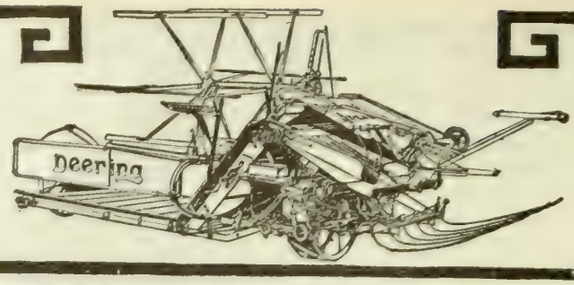
Immigrant Rush Over the I. C. R.

Record Number of Trains in the Past Month.

The rush of immigrants through Halifax has kept the Intercolonial officials busy providing means of transportation, and although the demand for trains has been large there has been no delay in this respect. So far this season there have been despatched from Halifax thirty-five more special trains than for the same period last year. Last week there were several trains daily to the Hest.

That this season will be a record one for the number of immigrants landed in Halifax from Europe and despatched over the I. C. R., en route west, is quite evident by the way the new settlers are being rushed in during the last few weeks. For the past two months all the passenger steamers have been bringing large number of passengers and every boat is bringing a few more than the one that preceded her. Last week was the busiest yet, about 5,000 passengers having been landed at Halifax, and sent forward to their destinations. The Immigration and Railway officials have been kept busy and the immigrants have received quick despatch.

The Italian steamer Campania is now on her way to Halifax with about 2,000 and will be due this week. A large number of her passengers will be landed at Halifax, and the remainder taken on to New York.



GET ALL THE CROP THIS YEAR

THINK back to the last harvest time. Did you get all the profit from your acres that should have been yours? Or through delays, caused by tinkering with broken-down or inefficient machines, did you lose valuable time? Did you get all the grain—tangled or down—or did your machine leave a part of your profit in every field? Ask yourself today. Did I get the best results possible from my harvesting machines last year, and, if so, are they in condition to give me the same service this year? If not—

Now is the time to choose the machines that will get all the crop this year in the shortest time—with the least effort on your part. That means the Deering. They are machines that will give you the very best service. They are built to meet the conditions encountered on Canadian farms.

The Deering binder is a model of convenience for operating. It is a strong machine. You will not be troubled with breakages. It has light draft and has such a wide range of adjustment that it is adapted for all conditions of grain and fields.

You will be sure of satisfaction with a Deering. It is a proved machine. In addition to binders, the Deering line comprises various other machines in harvesting and haying machine lines, seeding and tillage implements. The Deering local dealer handles I H C gasoline engines, cream separators, manure spreaders, wagons, hay presses and motor vehicles.

Investigate the Deering line. Learn what Deering machines will do for you. Call on local dealer for catalogue and particulars or write to nearest branch house.

Listen to What a Middleton Man has to Say About the "Perfect" Spray Pump.

"DEAR SIR :—I want one of your No. 2 Spray Pumps, all brass, for my own use. You may place it to the credit of your sprayers that I am ordering one while I still have a good pump of popular make. I have had great pleasure in pointing out the excellent features of your pump. I was the first one to import and use a spray pump in the Valley. This was twenty or more years ago. I know about all the pumps in use. They all have one or two good points combined with some very objectionable ones. Yours has the good points of them all with the undesirable ones left out. When I say this, I speak from experience and can say nothing stronger in favor of your machine, unless I say that I consider it our patriotic duty to encourage the mechanical genius of one of our own countrymen."

Yours very truly

G. C. MILLER.

The 'Perfect" Spray Pumps are manufactured by
R. B. Westhaver, Mahone Bay, N. S.

Farm For Sale.

Two hundred acres. Thirty cultivated, twenty intervale hay land, two in orchard and buildings; remainder woods (maple, hemlock, birch and beech) with plenty of room for summer pasturing. History of the Clydesdale Horse.

(Continued from page 363.)

Clydesdale breeding on a large scale (at one time 350 mares), in Alberta, on the Walrond Ranch, for a quarter of a century, and my experience warrants me in saying that, if selected from dams sound themselves, and having no hereditary strains of unsoundness, using a sound sire, also free from hereditary taint, Clydes can be bred sound, and such, barring accidents, will remain sound through life.

From a professional standpoint, too, I can say that Clydes, properly kept in healthy surroundings, will resist, more than any other breed, the ordinary infectious diseases, and, as a rule, will recover quicker and more completely when attacked by them. Clydes, properly fed during colthood period, will mature and do light work as soon as any other breed,and sooner than most. No other breed is easier to break; as a matter of fact, most properly-handled Clyde colts will take to farm work as a pointer dog or a setter will to pointing or setting.

In the show-ring, no other breed of heavy horses can make such an imposing display, a fact that is being demonstrated year by year, by the increasing interest shown in them at the great New York show in Madison Square Garden, and the Olympic, in England. I think Clydesdale breeders are much indebted to the Nelson Morris Company for what they have done in showing their magnificent team of six Clydes. I believe the time has come when Clyde breeders must do more to keep the breed to the front, or they will suffer a temporary backset, so much is being done to push other breeds. But history repeats itself. I have seen so many attempts to push certain breeds of animals to the forefront. The Shorthorn, the Hereford, the Polled Angus, the Galloway, in cattle, all had their day; the Thoroughbred, Standard-bred, Hackney, Clyde, Shire and the Percheron, all had their innings; but the Shorthorn bull in cattle, the Thoroughbred in light horses, and the Clyde in draft horses, top them all. They produce an improvement, no matter what they cross, and this can be counted on, whereas my observations lead me to believe that this cannot be truly said of any other breeds.

My advice, based on long experience and observation, is, to the farmer, stay with the Clyde, but select the best sire and dam to breed from; for, like every other breed, they can be degenerated by errors in selection and mating, and very readily by neglect and mismanagement. Don't breed from the pedigree only; "like begets like," and individual excellence should be sought for in selecting both sire and dam.

CREAM WANTED.—We wish to call attention to the ad. of The Standard Creamery Co., which appears for the first time in this issue. This enterprising firm has taken over the business and premises formerly operated by the St. John branch of the Maritime Dairy Co. The business is conducted by men who have had considerable experience in the creamery line in all its branches and have had singular success in giving satisfaction to the farmers. Parties having cream to dispose of will do well by patronizing this company.

In Tamworth swine we have several excellent young sows for sale. Prices most reasonable. Write or visit us.

J. R. OASTLER, Supt.

Some Observations on the Production of Sanitary Milk in the Maritime Provinces.

It has been written that over the entrance to every place where dairy operations are conducted should be inscribed the injunction "Be ye clean who enter here." Research and experience, year by year, showing the justice of the gospel of clean milk and the urgency for the adoption of the precepts of this gospel. When posterity looks back on our work so far they will see a people of mingled sincerity regarding this question of sanitary milk. What of our present opportunities, of our present obligations!

It has been said that the average man is a dirty man; and granting this to be true it only goes to prove the need for advancement all along the line. When the condition is such that no one can cast the first stone because he is not "without sin," we are in a unique position to take stock of where we are at. From this point by mutual effort we can then advance to a plane where we will be a clean, healthful and more progressive people.

We must adopt a consistent and persistent educational propaganda for scattering the gospel of clean milk throughout the heathendom of dairy practice. At the present time there is bearing on sanitary milk a large amount of published matter, and much of it is available to the public in bulletin form. More exhaustive treatises can be obtained at very reasonable prices. In frequent reviews of this matter the press can fulfil a noble mission. Municipalities can issue such information as will be of practical and educative value to sources from which their milk is obtained. Municipal authority to inspect these sources is one of the more prompt and effective methods of procedure. This is as it should be for undoubtedly the responsibility for the quality of the milk retailed in any municipality belongs to the officials of that municipality. With reference to inspection, to which we must submit and should welcome, it is to be noted that the best work is accomplished by making the introduction of the inspection a matter of education rather than an arbitrary enforcement of even the simplest of book rules.

Interesting and instructive information is supplied by the report of the Milk Commission appointed by the Ontario Government in 1909 to enquire into the production, care and distribution of milk. Nothing talks like a real investigation. Our percentage of deficiencies will be at least equally high. About 10 per cent. of the dairy farms visited by the Commission were found to be wholly unfit to be in the business of producing human food. Conditions in London and Copenhagen were studied by Mr. C. C. James, Deputy Minister of Agriculture. Mr. James reports that he believes the city of Copenhagen has the best general milk supply of any city in the world and he found the retail price of this milk 5 to 5½ cents per quart. When conditions for profitable milk production are not so favorable in Denmark as they are in the Maritime Provinces, then where is the responsibility for our quality of milk being sold at a price much above this and still the cry, "no money in dairying?"

City sanitary regulations are given under which milk may be delivered to and sold in the city of Copenhagen. Following these is a simple statement of the operations of the Trifolium Dairy Company. This company delivers 25,000 bottles of milk per day in the city of Copehagen and to show the fair manner in which the patrons are treated I copy one section of the regulations. "In the event of cattle becoming diseased between two visits of the veterinary, milk sellers covenant immediately to separate animals, especially if tuberculosis, inflammation of ducts, milk fever or acute diarrhoea occur, and in such case retain the milk from such cows and to inform veterinary. Any milk so retained will in such case be paid for until the veterinary's opinion has been given." A similar idea is presented in Mr. James' report on the Aylesbury Dairy Company, of London, England. "In 1908, scarlet fever broke out in the home of a producer. His milk was at once ordered to be with held until the Medical Health Officer reported a clean bill of health. This one case cost the company £161 6s. 7d. of which £148 10s. 8d. was the value of the milk not delivered to the Company.

Our practice differs so much from the foregoing regulations that ample excuse is found for mentioning them.

Of course we must admit that the question of sanitary milk is tied up in an already too high a cost of production. Until our farming methods produce a greater yield of more suitable feed for milk production; until the non productive cow is a thing of the past; until the cow which is capable of giving a large amount of milk is fed intelligently the business will always have a mill stone about its neck.

There are a number of points, however, the attention to which will always make the best out of even unfavorable conditions. It is surprising what can be done in this respect. Let us take a look at a number of them.

1.—Water and food supply. It is unreasonable to ask a cow to act as a filter to remove impurities from her drinking water. Cows should not be obliged to drink water from barn wells that are contaminated with seepage from the stable. Let us remember that out of eight pails of milk given by the cow seven are water. Tainted feed must be avoided for the same reason.

2.—The stable and stable air. There are stables that are dark and filthy. In these stables the air is laden with foul gases. If there is such motion in the stable at milking time as will cause dust particles to float in the air the conditions are made very much worse. These dust particles teem with bacterial ,ife of the foulest kind. Imagine milk coming clean from the cow and passing through an air like this.

3.—The cow. It is apparent that the cow must be healthy and clean. Nothing short of a miracle would get clean milk from some cows and through some stable conditions.

4.—The person doing the milking. How important he is! To think that two men can take the same pails, go to the same barn and milk the same cows under the same conditions and that for every 13 bacteria one man brings back in the milk the other man brings back 63. The aim should be to have the milking done by those whose sense of cleanliness is high.

5.—Milk vessels and strainers. Too much of the tinware sold is unsuitable for milk vessels. Pail tops are too wide and the tinning and soldering poor. A good place to get an idea of the tinware in use is to visit a repair tin shop. The visitor will often see milk vessels with a hard deposit on the inner surface. Imperfect washing and the use of hot water before the vessel has been cleaned produce this condition. The cleaning process is made much more difficult. And then the average tinsmith repairs these vessels as an accommodation and not as a business. Rarely

Make Every Cow Pay Her Board.

Do you know what your cows are doing? Do you know which ones are profitable—which ones are eating their heads off? It will pay you to get rid of the robber cows.

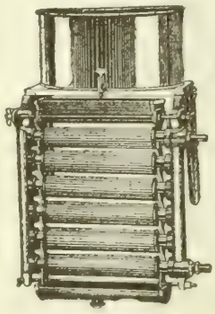
The Automatic Milk Scale and The Facile Jr. Babcock Tester

will show you in a short time which cows in your herd are paying a profit

The Automatic Scale is made especially for weighing milk in the pail. There is a loose indicator on the dial that can be set at o by a thumb screw when the pail is on the hook. Then when the pail of milk is placed on the hook, this indicator gives the exact net weight of the milk. It has another indicator that records the same as any spring balance, so it can be used for weighing anything up to 30 pounds—larger sizes weigh up to 120 pounds.

The Facile Jr. Babcock Tester is designed especially for use in the dairy and on the farm. It is extremely simple in construction and operation. The working parts consist of but two cut gears and they are enclosed in a cast iron case to keep them free from dirt and to prevent their catching clothing, towels, etc It turns easily, without vibration or jar. It is sent complete with glassware, bottle, brush and acid and full directions for use. It will pay you to have this scale and tester, whether you milk three cows or thirty cows.

Price $5.00 **Price $4.50**



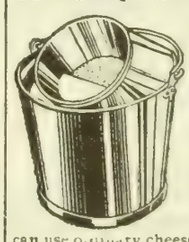
THE SECRET OF PURE SWEET MILK.

You dairy farmers can't afford to ship impure, germ-laden milk into the towns and cities. Our medical authorities are urging the Government to penalize offending dairymen very severely—don't you run any risks. If you pass all your milk through the Root Cooler-Aerator immediately it **leaves** the cow, you can guarantee it pure and sweet and get a bigger price for it per gallon. The

Root Sanitary Milk Cooler-Aerator

will keep the milk sweet for 48 hours because it kills the animal heat quickly and cools the milk to the same temperature as cold running water. The water is admitted at the bottom, flows through the bottom tube, then from the water column into the second tube and so on until it reaches the top tube. Thus the cylinders are kept perfectly cold all the time, and as they are deeply corrugated the milk flows down them slowly, reaching the retaining pan thoroughly cooled and areated. Cylinders are made of heavy copper, galvanized outside and guaranteed to stand heavy water pressure. Perfectly simple to operate—no complicated parts—a child can easily clean the whole machine in 5 minutes. Made in various sizes—will cool from 40 to 75 gallons an hour. Write us to-day for catalogue and prices —every dairyman should have a Root Cooler. It's a big money maker.

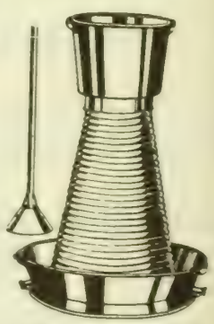
INCREASE YOUR DAIRY PROFITS



Strain your milk as it **leaves** the cow, not afterwards, and see that you strain milk **only**, not milk, dirt and bacteria. You can make pure milk and absolute certainty by using the

Sterilac Sanitary Milk Pail

Note its clever construction. The funnel is detachable. As the milk falls on the slant towards the milker, it passes direct to the strainer into the pail. All dirt falling into the opening is caught on a shelf or screen inside the funnel—not on the strainer—thus milk and dirt never come in contact. You can use ordinary cheese cloth for straining. Capacity 14 quarts, no joints on the inside; it is easily cleaned. **Price, $2.50.** Used by all up-to-date farmers and dairymen.



Purity Milk Cooler-Aerator

Cools milk rapidly, within 2 degrees of running ice water, well or spring water, wichever you use. Rapid cooling and thorough aeration insures milk keeping sweet for 48 hours and destroys odors The milk flows through the perforated pail on top on to the corrugated body, which ensures the milk running down slowly so that it is perfectly cool when it reaches the retainer pan. There are outlets at each side of this pan. This cooler is well made, has soldered seams, is easy to clean and simple to operate. Will last for years. **Price, $6.50.** Guaranteed as represented.

Write for Free Catalogue To-Day.

W. A. DRUMMOND & CO., King Street, East. Toronto.

METALLIC CEILINGS

Both clean and fire-proof—no dust and dirt falling, as from plaster ceilings. Costs no more, but looks thrice as artistic. The life of a plastered or papered ceiling is short and nearly every year needs repairs. Our ***Metallic*** Ceiling will last as long as the house—always fresh and clean. We can send you hundreds of pretty designs to select from for both ***ceilings*** and ***walls.***

Our beautiful free booklet tells you all about Metallic Ceilings and Walls. Send for one.
Phone Park. 800.

"Really I don't know how people can stand the constant drudgery necessary to keep the ordinary ceilings and walls clean. Metallic is so clean and sanitary."—The Philosopher of Metal Town.

T. W. Boyd & Son,
27 Notre Dame St. West, Montreal

is the soldering flowed smoothly or in sufficient amount. See the tinsmith mending an open seam. He places his hot iron on it and is rewarded by an indescribable odor rising from the polluted crevice. With disgust, and often profanity, he indifferently stops the leak and passes the incomplete work. It is practically impossible to thoroughly clean much of this tinware with facilities such as prevail on the average farm. The vessel goes back to continue its neferious work. To milk clean milk into this vessel is to at once seed this milk with the elements of a flying start to perdition. As humanity is ordinarily constituted everybody wishes he had the other person's job, but in this case the tinsmith is not so much of a pessimist.

The best dairymen are conducting their work with the object of keeping dirt out of the milk rather than trying to strain it out after it has gained an entrance. An unclean strainer does more harm than good.

6.—The cooling of the milk. Milk should be at once removed to a place where the air is pure and then thoroughly cooled. Some day we are going to use a great deal more milk and milk products than we are using at the present time. Nothing is better or more economical. The luxury of this use will be available to the poor and the rich can enjoy nothing better.

W. N. ROBINSON.

The subject of this sketch, Mr. W. N. Robinson, has been on the staff of this paper for the past two years and through his energy, persistence, pluck, and enterprise has proven himself to be the best solicitor that has ever been in the employ of this company and possibly the ablest farm paper solicitor that has ever entered a farm home in Canada. When Mr. Robinson joined our staff we had in the vicinity of 3,500 subscribers, he is leaving us with about 8,000,—practically all the result of his labors. We regret that he is severing his connection but we can but wish him success in his new sphere.

He was made several very flattering offers when on a trip West in our interests. One of these he practically accepted, thinking that the Maritime Provinces could not hold out as good or a better proposition. But as soon as it was known that he had decided to sever his connection with us offers seemed to come to him from all quarters in the Maritime Provinces, but the situation which appealed most to him was the one offered by the Sussex Manufacturing Company, Limited, in the capacity of travelling salesman for that concern. He has already entered upon his new duties.

Mr. Robinson is a graduate of the S. Kerr & Son, business college and came to us fresh from that school.

We feel sure that all readers who have met Mr. Robinson—and this includes a large percentage—will be glad to know his earnest efforts are being appreciated and will join with us in wishing him every success.

The J. B. Armstrong Mfg. Co., whose advertisement appears on another page in this issue, have been very successful during the past few years through the enterprising efforts of their representative, Mr. H. A. Amos, is establishing their trade in nearly every place of importance in the Maritime Provinces.

At Oxford, N. S., a complete assortment of their very extensive line of carriages is carried, available for quick shipment to all parts of the Provinces named. In line with their successful policy, new styles have been added this year and a careful study has been made of the trade requirements in these Provinces.

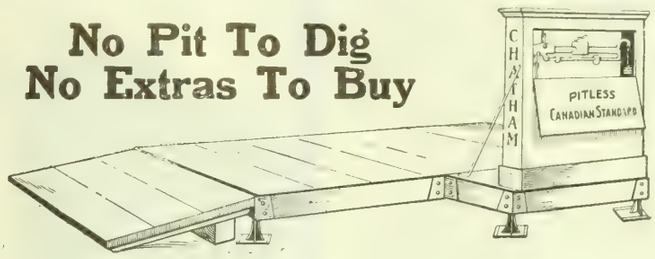
Any enterprising agent who does not handle the Armstrong Line should communicate with their Oxford, N. S. address, where Mr. Amos looks after their business, a catalogue or quotation will be promptly supplied to all enquirers.

This 5-Ton Scale Is Easy To Buy—

You need not club with your neighbors to equip your farm with the scale you need—the CHATHAM Pitless Scale. You can afford to buy it yourself. It will save you more than its cost in one season. Up to five tons it will weigh accurately all you buy or sell. You can erect it ready to use in a morning.

Comes Ready For Use **You Have No Bother**

No Pit To Dig
No Extras To Buy



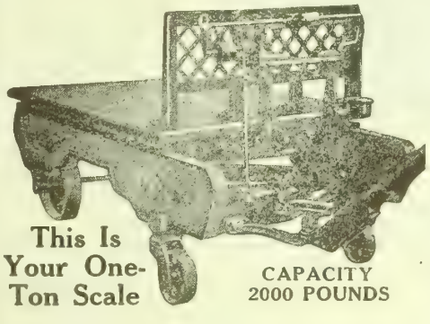
Your CHATHAM Pitless Scale will be YOUR Scale that you can take with you when you move. You can always get for it what you paid for it. And you need no skilled help to set up the CHATHAM—it comes to you complete, with plain directions. Built wholly of heavy steel. Nothing to rust, decay or go wrong. Government guarantees its absolute accuracy. Tested before it leaves the factory. Warranted fully.

This is the Complete Scale

Bear in mind that you have no hard work to do in setting up a CHATHAM. It is all solid steel, stands on its own feet above ground—no pit to dig, no fussy preparation needed before you use it. Comes to you so you can be weighing on it in a few hours after you get it. No skilled mechanic necessary at all.

Special Compound Beam — No Extra Cost

This season we include our new Compound Beam with each CHATHAM Pitless Scale without adding a cent to the price of it. You can find no bigger bargain; yet the price is 'way down low. In sections where we have agents we offer special long-time credit terms to those who would rather try the Scale before they pay for it. Write us and ask for full details.



This Is Your One-Ton Scale CAPACITY 2000 POUNDS

Handy to move about as a wheelbarrow, yet accurately weighs up to a full 2,000 pounds. Swivelled pole and front wheels let you turn it short through doorways and around corners. Strong and staunch, too, like all scales we build.

You'll Never Wear It Out

Main frame is one solid and very heavy casting. Levers are special heavy and strong, so they won't spring under excessive strains Bearings align themselves, because pivot rests on bearing loop — tilt the scale and it will still weigh right. And the price is very small!

I personally vouch for every statement this advertisement makes, and I further guarantee that my Chatham Pitless Scale is the biggest scale value you can buy for money in this or any other country. Write me about it and I will see that this is proved to your complete satisfaction. Write now.

Making Cellar Water Proof

J. X. L., P. E. I.—Will you let me know through the columns of your paper if I can keep water out of a cellar that has a small spring rising in it. It has a wall all around it and I want to put in a cement floor. Spring only raises in very wet weather. It is our root cellar, and there is about 2 feet of water in it now. What thickness of cement will be required and what rate of mixture should be used?

Drain or pump out all the water and endeavor to plug the spring or if possible put in a drain that will carry off the surplus water, then lay down a coat of Concrete about 4 inches thick made of a proportion of 1 part cement to 4 parts aggregate. This aggregate should contain sufficient sand to fill all the voids and thus make a dense mixture. The Concrete should be put down very wet and tramped in place, then put on a coating of about ½ inch thick made 1 part cement to 2 parts fine sharp sand, thoroughly tamp this down into the other leaving the top only tamped not endeavoring to level it for a finish. Next apply a float 1 part cement to 3 parts clean sharp sand about 3 inches thick,this should also be applied very wet and tamped down and straight edged, then after the water is settled from the surface float and finish.

If this work is properly done it will keep the water out of the cellar.

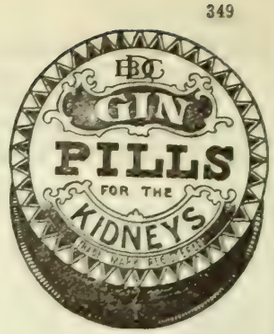
H. P.

The Clydesdale Stallion Colt, "June Day," offered for sale by Fred S. Black, Amherst, N. S., in his ad. on another page of this issue won second place in strong competition at the Maritime Horse Show, recently held in Amherst.

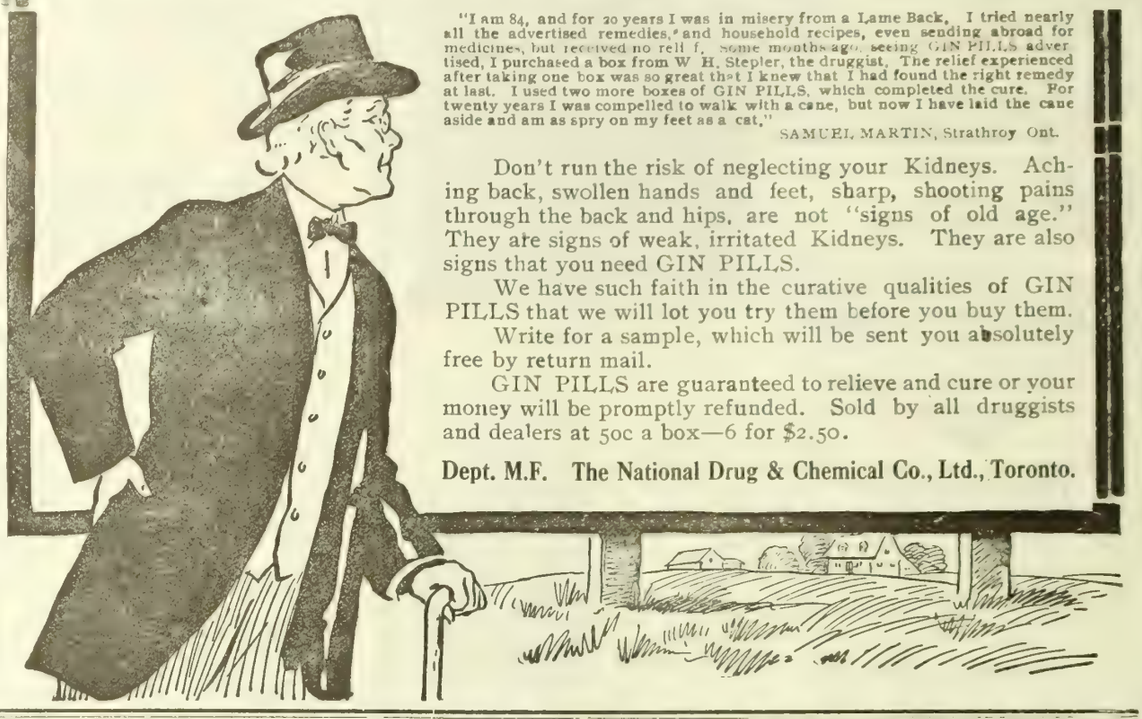
Help for weak aching backs

Few people reach old age entirely free of Kidney Trouble. That is why so many men and women of 50 and 60 suffer tortures with lame back, aching hands, arms and legs, Rheumatism, irritated bladder and frequent passages at night.

GIN PILLS mean a healthy, hearty old age. GIN PILLS keep the kidneys well and strong. GIN PILLS neutralize Uric Acid, which causes the pain, and soothe and heal the irritated kidneys.



Here is What Gin Pills Did for One Man 84 Years Old.



"I am 84, and for 20 years I was in misery from a Lame Back. I tried nearly all the advertised remedies, and household recipes, even sending abroad for medicines, but received no relief. Some months ago, seeing GIN PILLS advertised, I purchased a box from W. H. Stepler, the druggist. The relief experienced after taking one box was so great that I knew that I had found the right remedy at last. I used two more boxes of GIN PILLS, which completed the cure. For twenty years I was compelled to walk with a cane, but now I have laid the cane aside and am as spry on my feet as a cat."

SAMUEL MARTIN, Strathroy Ont.

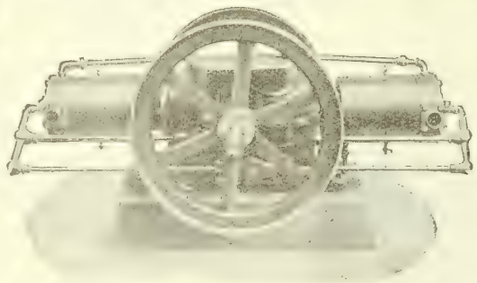
Don't run the risk of neglecting your Kidneys. Aching back, swollen hands and feet, sharp, shooting pains through the back and hips, are not "signs of old age." They are signs of weak, irritated Kidneys. They are also signs that you need GIN PILLS.

We have such faith in the curative qualities of GIN PILLS that we will let you try them before you buy them.

Write for a sample, which will be sent you absolutely free by return mail.

GIN PILLS are guaranteed to relieve and cure or your money will be promptly refunded. Sold by all druggists and dealers at 50c a box—6 for $2.50.

Dept. M.F. The National Drug & Chemical Co., Ltd., Toronto.



Made in 10, 16, 25 and 40 H. P.

Two Cylinder Opposed Gas and Gasoline Engines

The Two Cylinder Opposed heavy, duty engine is made to meet the demand for a successful engine for portable, traction and electrical work from 10 to 40 H. P.

This work requires the very best in every way possible to obtain in design, material and workmanship. A cheap single cylinder or light weight two cylinder engine will not answer as this work requires a strong and powerful engine with the minimum weight.

The Two Cylinder Opposed is the most satisfactory type on account of its lack of vibration, high efficiency, close regulation, economical fuel consumption, reliability and convenience.

For stationery and ordinary power purposes, they have no equal.

They make the most perfect electric light and do not require the extra heavy fly wheels or a fly wheel on the generator to produce a pleasing light.

They are the most economical and satisfactory engine made.

The London Gas and Gasoline Engines are Made in Canada

and are easy to start, easy to operate, easy to understand, right in principle, right in design, right in material, right in workmanship. Have few working parts, large bearings, well balanced and smooth running. No waste of fuel or battery, no wear on pump between impulses, enclosed crank case, mechanism running in oil, gasoline carried in base of engine, all parts strong, simple and accessible. A perfect reliable oiling system. No tank, no fan, no freezing, no packed joints. No difficult adjustment to make, jump spark ignition and four cycle.

Small Gasoline engines are fast becoming a household necessity and to supply this demand we produce the **"LONDON"** designed and constructed to avoid the many annoyances so common to small engines.

In the manufacture of these engines we have used our best efforts to embody the smallest number of working parts possible maintaining all essential features necessary to make it a first-class reliable engine, easily operated by boy or girl.

Every **"LONDON"** engine is thoroughly tested and regulated before leaving our factory and so far as adjustment is concerned, is ready to be put in operation as soon as the gasoline is furnished for the fuel tank, battery connections are made and the water jacket filled.

Any make of gasoline engine will run something—somewhere—somehow; the **"LONDON"** will run anything—anywhere—all right up to its rated capacity. It is always ready for all purposes, at all places, in all kinds of weather, all the time. Wind or no wind, winter or summer, you can always pump water if you have one of our pumping outfits.

It is especially designed to meet a growing demand for a light, reliable power for pumping water, running cream separators, sprayers, all kinds of water systems, saws, cement mixtures, printing presses, feed grinders, and all light farm machinery.

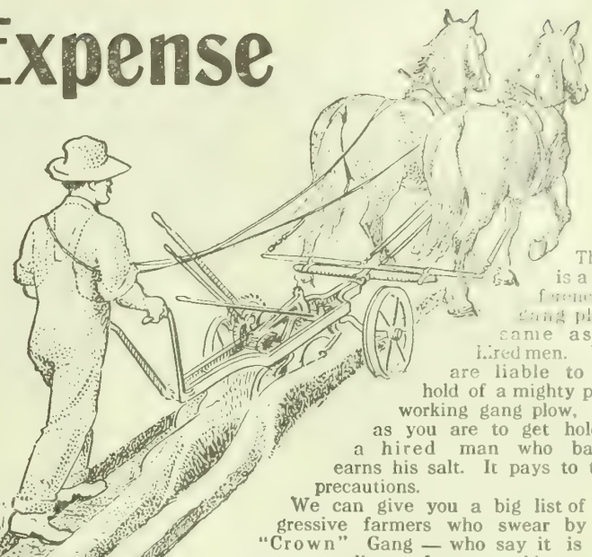
Look at This.

Saves Time, Labor and Expense

Frost and Wood Crown Gang Plow



We urge you to do your plowing this season with the "Crown" Gang Plow instead of using single-furrow walking plows—or riding plows. The "Crown" turns two furrows where the ordinary walking plough turns one. It turns the furrows faster, cleaner, more evenly, too. You walk twice as far, and take more than twice as long, to do the same amount of work with a single-furrow plow as you can do with the "Crown" Gang.

But why walk at all? Why not use a riding plow, you say? Simply because it isn't good business to do so. When you use a riding plow you hitch on one more horse than the single-furrow plow needs. The extra horse is not to do the work faster. It is needed to pull your extra weight around the field. Now, can you afford the expense of that extra horse merely to enjoy the luxury of riding? Why not use the extra horse on the "Crown" Gang and break twice as much ground?

Just do a little figuring for yourself and you'll prove that the "Crown" Gang will pay for itself in one season in the time, labor and expense it will save you. If you would like your figures verified, send for booklet which shows how the "Crown" Gang will save you $15 per week.

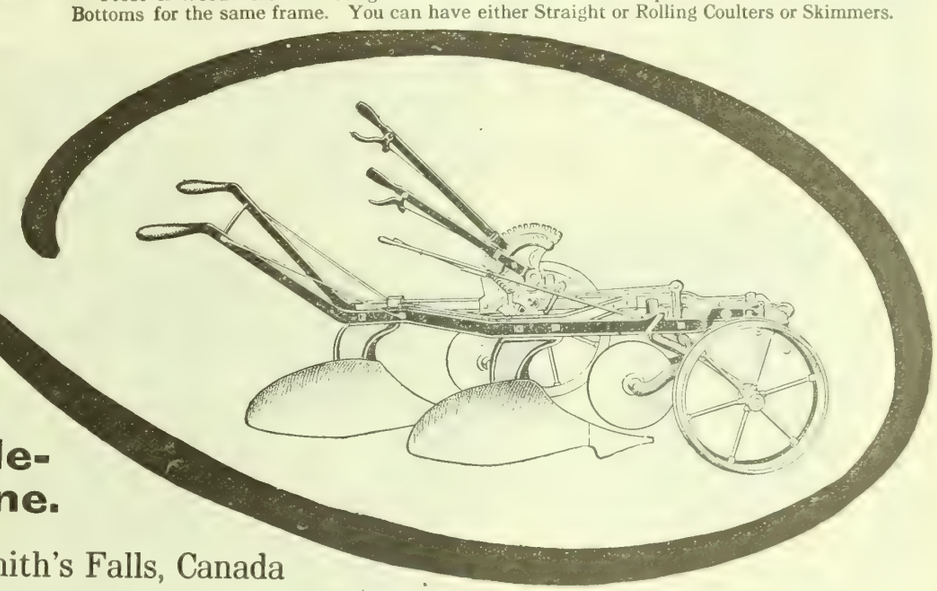
46

There is a difference in gang plows same as in hired men. You are liable to get hold of a mighty poor-working gang plow, just as you are to get hold of a hired man who barely earns his salt. It pays to take precautions.

We can give you a big list of progressive farmers who swear by the "Crown" Gang — who say it is the surest, steadiest, fastest-working plow they have ever seen or used. The "Crown" is not, like so many others, an old "failure" which has been rebuilt or remodelled. The "Crown" is a plow on which we spent a good long time, and no little cash, to perfect. It was not placed on the market until it had been tested many months under various soil conditions in different sections of the Dominion. We knew the "Crown" was a "success" before we made a single sale, and it has made a record we are proud of.

It's the perfect shape of the mouldboards that makes the "Crown" Gang turn the sod so easily and produce such clean-cut, beautifully even furrows. It's because they are made of soft-centre crucible steel and highly polished that they scour so quickly. The wheels are guaranteed dust-proof, too. And they have roller bearings—which lightens the work for the horses.

Once you set the plow you need not touch the easy-working, conveniently-located levers again. The "Crown" Gang will stay right down to its work and withstand the hard strains of plowing through heavy land. The "Crown" is so sturdily built that it will triumph where an ordinary plow will fail you. So just make up your mind you'll own a Frost & Wood "Crown" Gang Plow this season. You can purchase both sod and stubble Bottoms for the same frame. You can have either Straight or Rolling Coulters or Skimmers.



Turns Two Clean, Even Furrows in Same Time Single-Furrow Plow Cuts One.

The Farmers Future Building Material.

RESIDENCE BUILT OF CONCRETE, COST COMPLETE $15,000.00.

A few years ago, I remember riding on a Grand Trunk train, and suddenly we noticed a red glare, and were swiftly gliding by a scene that is occurring too often,—a farm house on fire—the inmates frantically running back and forth, each time saving some household article, flames raging in the roof near the chimney, and so perhaps most of the lower floor belongings were saved, but the house was doomed to complete destruction, being built entirely of wood and no fire protection at hand.

Although the burnt child dreads the fire, not so the parent. If he burns out, and is fortunate enough to have carried some insurance, he will not heed the lesson, and perhaps the very next day is beginning to figure on re-building of the same inflammable material.

It is not only the individual, however, entire communities have been known to do the same fool thing.

In the United States, the loss by fire is almost beyond comprehension —including insurance premiums and preventive agencies, the loss in 1906 reached the enormous total of over $500,000,000.00, being over 80 per cent of the value of the total new building construction for that year. I could continue the statistics as to loss of life attendant upon the fire friends sway that would seem almost incredible.

Old Mother Earth, that ever contributes so abundantly to our sustenance, is equally ready, from her store-house of eternal riches, to provide in plentitude our best building materials. Sand and gravel are to be had in almost every locality, and when you consider that this material makes up more than three-fourths of the necessary ingredients to produce an indestructible building material, it makes one feel that a wise Providence is indeed shaping the destiny of mankind to a better understanding of life's requirements.

Of all the building materials called to the attention of mankind, none have so completely won favor as the Concrete Building Block. It is the most wonderful building unit ever evolved by man, and its destiny is like its own composition,—everlasting. Its use has spread with a rapidity that can be likened to a sweeping prairie fire, fanned by the tornado's breath, and construction with blocks has found devotees and favor in the furthermost corners of this earth.

Within the past fortnight, America's foremost citizen, ex-President Roosevelt, at Khartum, in the Sudan, 600 miles up the White Nile, at the very outpost of Western civilization, spoke within the walls of a concrete block building, a Mission church, built by the American Mission Society.

The adoption of the Concrete Block in that region must be credited to a Reverend Mr. Sowash. He purchased a Block Machine in the United States of the Face-Down variety, which machine has not only a national, but an international reputation. The simplicity of the machine is such that even the natives were quickly able to use it and make blocks. Mr. Sowash began building and the natives gazed with open-eyed wonder while the engineers in charge of the Government Public Works Department, shook their heads in doubtful suspense for the season of wind-storms, which would blow down these 8 inch wide walls, but the storms raged during the unfinished period of construction, and the defiant walls shook off their adversary. After completion and use, another period of storms arrived, and again the native population and foreign element came forth to see a catastrophe, but again it stood the strain, as would have the Rock of Gibralter.

Then were even the Government Officials convinced, and borrowed this Mission machine for experimentation. Soon there came to the American manufacturer a carload order. This was followed by a duplicate order, until the Sudan Government has now established eight Concrete Block making plants, and has advised their intention of starting four more, carrying on all Government work with blocks as the prime building material.

In far off India, Australia, Japan, China, Korea, Siberia, Africa, Europe and South America, are Concrete Block Machines at work. One American firm, with a branch factory at London, Canada, has sent its machines to all the countries mentioned, and has over 8,000 in use in the United States alone.

The American farmer is adding it to his equipment as he does the necessary agricultural implements. His twelve-year-old boy can make blocks and considers it play and recreation. The farm hand, during a rainy spell, or when not otherwise employed, can make them. The winter period of inactivity on the farm may be used to prolific advantage.

A barrel of cement, properly mixed with sand and gravel, will produce fifty blocks. Instructions for mixing, proportions of sand, gravel and cement to be used, amount of water and consistency of material, are furnished in simplicity of language easily understood by the average school boy.

Given the proper machine, that embodies simplicity, mechanical perfection and durability, and the most inexperienced, with instructions for operating, will turn out a block every

RESIDENCE BUILT OF CONCRETE. 18 FT. HIGH, 8 FT. DEEP, AND 34X35 FT. TOTAL COST $3,800

two minutes. Carefully handled in its green state, when taken from the machine to a place undisturbed, it will take on its initial set of crystalization or hardening process within the first six or eight hours, and at the end of 24 to 36 hours, depending on weather conditions, can be safely removed for storage into the oven.

Its curing process is to simply souze it with water say twice a day, morning and evening, for a week, especially in very hot, sunshiny weather. If the farmer has enough storage room under roof, a somewhat better curing result is generally obtained. The block should never be subjected to hot winds or sunshine until at least 36 hours after being made, nor should a block be used until it is from 14 to 21 days old.

With these easily adopted rules adhered to, the farmer has obtained a building unit 8 in. high, 8 in. wide and 16 in. long, which, struck with an instrument, will ring like flint, that becomes harder with age and will not disintegrate, that is fireproof, frost-proof, vermin-proof, sanitary, dry, eliminates all expense of repairs, requires no paint and properly laid with the use of good mortar will prove a cool abode in summer and a warm one in winter.

Such construction means a saving of fuel, greater comfort, a saving in the amount of insurance carried and peace of mind through security that cannot be bought by dollars. It can be given the most artistic cut stone facing effect without a cent of additional cost. Each block displaces the equal of twelvebricks, and an 8 in. block wall has greater strength than a 12 in. wall of brick.

It can be and is being used for every possible kind of construction. On the farm, it is practical for building houses, barns, silos, bins, foundations, etc., etc. In the cities, there is no kind of construction that it is not applicable to. Railroads are making their blocks for depots and switch towers.

One of its striking features is the fact that not only can the inexperienced soon learn to manipulate the machine and produce the product, but on account of the size of the block as a unit, it is easily laid in the wall by men totally unfamiliar with masonry. It is even possible now to buy mortar gauges to lay on the blocks by which the mortar reaches the correct section and by the gauges is spread to proper thickness and proportion.

No wonder that the brick trusts are fighting for their very future; no wonder they recently voted to spend a great sum of money in advertising; no wonder they started a campaign of vilification and untruth against the Concrete Block. But the handwriting is on the wall. Nothing can erase it. It has virtue and virtue will ever live. It has Time's finger pointing to its use and existence, unshaken by its ravages for twenty centuries.

Time will be when every building law will be framed for its compulsory use. The awakening has come. Security and self-preservation demand its use. Conservation of our forests demand it. The hand of Providence can be seen, saving us from the destruction that is sure to follow by flood the denudation of our glorious woodlands.

The trend of the cement age can best be gauged by the spontaneous outpouring of interested people at the recent Cement Shows held in Chicago, Ill., and London, Ontario, where many thousands of people sought information.

In twenty years, the production of cement in the United States has increased from a few thousand barrels, until last year's output touched the 50,000,000 barrel mark. In Canada the increase in the last five years was from 1,000,000 to 5,000,000 barrels.

" Mr. Farmer, if some steel shingles are as leaky as the guarantee behind them, they're not worth the cost of labor in laying them. Stick to 'The Eastlake.' "— The Philosopher of Metal Town.

You can build cheaper than ever before—you can make your farm buildings weather proof for all time with ——

"METALLIC"

Lumber is of inferior quality now-a-days. Why pay high prices for it when you can cover your buildings with "Metallic"? Galvanized sheet steel is the most desirable building material known, and "Metallic" is the heaviest and toughest made.

By actual test "Metallic" has proved itself the best material for roofing and siding. Roofs covered with "Eastlake" Metallic Shingles 25 years ago are in perfect condition to-day —absolutely lightning, wind, rain, snow and rust proof.

Look over this list, check the items that interest you, clip list and mail, with your name and address to us. We will give you valuable information that will save you money.

"EASTLAKE" METALLIC SHINGLES—for all buildings.
"METALLIC" ROCK FACED STONE OR BRICK SIDING—makes an artistic house.
"METALLIC" CEILINGS AND WALLS—most sanitary interior decoration.
"MANITOBA" STEEL SIDING—for grain elevators.
CORRUGATED IRON—for barns, implement sheds and stock buildings.
"Metallic" Granary Lining—easy to lay. Protects the grain from rats, mice and other vermin.

On receipt of your name we will mail you our interesting illustrated booklets, "Eastlake Metallic Shingles" and "Interior Decoration in Metal." Write to-day.

Toronto.

Impotency.

H. R. C., N. B.:—I have a cow that does not get with calf although she has been bred a number of times to good and different bulls. Can you tell me the cause of this and the remedy, if any?

This condition is recognized as impotency and may be caused by several conditions, such as excessive fattening which may cause a fatty degeneration of the overies, closure of the fallopian tubes, tubercular deposits in the ovaries, fallopian tubes or uterus, a hardening of the os uteri or opening between the vagina and uterus which may cause a closure of the opening, repeated immature breeding, a mild acidity of the fluids in the vagina or uterus that reduces motion and causes the death of the spermatozoa or male germ. Mildly alkaline surroundings increase the activity of the male germ and prolong its life. Treatment:—As the causes are many so must the treatment be, but in many cases, all treatments fail in the excessively fat animal. Reducing treatment is advisable, such as physic, consisting of from one to two pounds of Epsom Salts, according to the size and age of the animal, and two to four drams of Ginger dissolved in two quarts of warm water and given at one dose as a drench two or three days before coming into heat. Feed lightly for several days before and for twenty-four hours after administering the dose giving only a wheat bran mash at feeding times and watering often. Afterwards feed lightly and excerise daily. If on examination the os uteri is closed have it opened. A knowledge of the part is necessary for this so it is advisable to secure the services of a skilled operator. An injection of yeast cake solution into the vagina is frequently beneficial and may be administered as follows: Take a medium sized yeast cake, dissolve it in half a pint of warm water, not boiling, allow it to stand in a warm room for a few hours, add another half pint of warm water and inject it into the vagina, with a rubber bulb syringe, eight or ten hours before breeding. When degeneration or permanent closure of any of the organs exist treatment cannot be successful.

J. STANDISH, V. S.

Raising Young Ducks.

Mrs. W. R., York Co., N. B.:—"I would like to get some information on raising young ducks. Can anything be sprayed or rubbed on them to keep Black Flies off them? They are so numerous on or around them that they can hardly stand in one place long enough to eat and in three or four days they get so weak that they die. I think the flies suck all the blood out of their bodies."

In reply to the foregoing inquiry, the following experience from a practical breeder will be of interest to the enquirer:

My breeding Pekins have a limited range of grassy, sandy land and free access to a mill race after they have laid. They get their meat diet in the water. At all times the birds have access to drinking water. During the breeding season I keep one drake to six or eight ducks and thus secure good, hatchable eggs. As ducks are not reliable sitters, I use hens for hatching and rearing. It is necessary to nave large, clean coops with earth floors and to move them frequently to clean ground, because the ducklings are not only sloppy, but dirty. I often have calls for duck eggs early in April, but always discourage early setting. About the first of June is early enough to have the ducklings, then the cold, stormy period is passed, and the earth is getting warm.

Ducks need not only sunshine and warmth, but shade. A limited grassy range, not too large, if provided with a few bushes is admirable. If large, the little ones will run their legs off. For the first week I give bread and milk rather dry, then add unbolted corn meal about half and half. After a few weeks, they get wheat bran and once a day a little green cut bone fresh from the butcher's. Soon I feed some cracked corn and vary this feed with a good Johnnycake boiled potato and green feed, such as endive, lettuce or spinach. It pays to raise these crops for the ducks. I feed the ducks often, all they will eat clean, and as they are like cats for seeing at night, I give the last meal at nearly dark. Water they must have by them all the time, so I see to the drinking cups frequently. My drinking vessels are corn and salmon tins inverted in saucers.

I keep only a small flock of ducks to supply orders for breeding birds and eggs for setting. Only the surplus is disposed of for the table. There is a very large demand for breeding ducks and eggs, so that it pays to raise ducks for that purpose alone. For market purposes ducks can be raised well anywhere, even remote from water; but since all water fowls mate on the water, there will be complaint of infertile eggs if they do not have access to ponds or streams.

The essentials of duck raising are cleanliness, sunshine, shade and good food.

Another practical breeder says:—"I have never been troubled with black flies or any other vermin on ducks, but if they were sprayed with fly poison say, Dr. William's Fly Poison, I think it would prove satisfactory. I use it on cattle and it is the best thing I know of."

The above reply is from one of the oldest duck breeders in the country, and was submitted by Mr. A. G. Gilbert, of the Poultry Department of the fly poison in moderation, so that the ducks are not exterminated who says:—"I should advise the use as well as the flies.

Has any of our readers had any experience along this line?

Regular Habits

An Absolute Necessity For Good Health

You might as well expect to find a man or woman healthy with constipated bowels as to find a city healthy when its sewers are blocked with refuse.

Nature demands that the indigestible food and waste matter which collects in the lower bowels shall be got rid of at least once in twenty-four hours. If this is not done it decomposes, filling the bowels with poison, which is taken up into the blood and carried all through the body.

Naturally, this poison affects the work of every organ. *The liver is deranged, digestion is upset, and biliousness, headaches, lassitude and dizzy spells follow.*

Literally millions of people suffer these results of constipation without realizing the cause, or doing anything to remove it. Yet it can be removed, easily and with certainty, by using **Dr. Morse's Indian Root Pills.**

Take, for example, the case of Mr. George Andrews, Halifax, N.S., as he himself describes it:

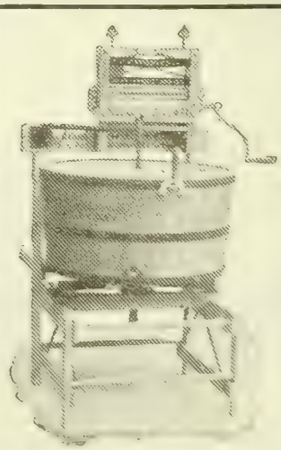
"For many years I have been troubled with chronic constipation. This ailment never comes single handed, and I have been a victim to the many illnesses that constipation brings in its train. Medicine after medicine I have taken in order to find relief, but one and all left me in the same hopeless condition. At last I read about these Indian Root Pills. That was indeed a lucky day for me, for I was so impressed by the statements contained therein that I determined to give them a fair trial. They have regulated my stomach and bowels. I am cured of constipation and claim they have no equal as a medicine."

Dr. Morse's Indian Root Pills were first taken to cure constipation nearly a hundred years ago, and during the last half century they have been very extensively and very successfully used throughout the world. *They are entirely vegetable in composition and do not sicken, weaken or gripe like mineral purgatives.*

DR·MORSE'S INDIAN ROOT PILLS

For Constipation

For Sale Everywhere at 25c. per Box. 21



The Connor Ball Bearing.

J. H. CONNOR & SON, Limited, OTTAWA, ONTARIO

Raise The Crop That Never Fails

That crop is poultry—the crop that knows no "bad years." You can raise that crop on your farm, no matter whereabouts in Canada it is. You can raise poultry successfully, make money doing it, and be sure of a good market for all you do raise. You need make no heavy investment to start at it; you need no elaborate equipment; you don't have to give up a big slice of your land to poultry-raising, even if you go into it on a pretty big scale.

Nor is it hard work to make a go of poultry-farming,—not anything like the work it takes most everywhere to make even a pittance out of ordinary farming. Poultry-raising, nowadays, with The Peerless Way to follow and the certainty it provides for you, is actually a business that you owe it to yourself to get into, and to get into right away. Consider the matter carefully. Read every word of what follows, and act upon its suggestions.

This Is How You Can Make Your Farm Pay Better

First of all, sit down now and drop us a post card with your name and address on it. That will bring you a book you ought to read twice, at least,—it is packed so full of facts about poultry-for-profit. It tells you the real truth about poultry-raising; there is no empty theory, no clever writing, in it at all; but it certainly does clear up a lot of problems that use to puzzle people. This book explains just why The Peerless Incubator, The Peerless Brooder, and The Peerless Way make a combination that puts success within anybody's reach—makes success practically certain, failure practically impossible.

The Peerless Incubator is so designed, so constructed, from practical experience, with precise knowledge of the climatic conditions of every section of Canada, that it will positively hatch perfectly in any part of the country. When you get that book we ask you to send for, you will read letters in it from every province of the Dominion,—letters from people who have done with the Peerless what they could not have done with any other incubator built. That may sound like a bold statement; but you will learn its truth once you study the subject. Get the book and see why.

Very Little Money Will Start You Right

Don't imagine for a moment that you need a great deal of cash to start after the profit there is in poultry. One important feature of The Peerless Way is how easy it is made for our friends to go into the business with but very little ready money. And don't imagine, either, you need be anything of an expert to succeed with poultry. Your own good common-sense, added to a fair degree of diligence and effort, equips you thoroughly to make money poultry-raising, and to make it quick. Get the cold facts.

We Guarantee To Find a Buyer For Your Product

Here is another valuable service you get when you follow The Peerless Way:—We guarantee to find a buyer for all the fowl or eggs you want to sell—a buyer who pays spot cash, pays the highest market prices, and charges no commission whatever. Poultry prices, and prices for eggs—as you would know if you lived in a city—have been climbing steadily year after year. They are going to be higher still; they will never be lower, at least; because the demand is growing faster than the supply.

You Get, Free, The Advice And Aid of Experts

Another very important thing about The Peerless Way is that our interest in your success doesn't lapse when your Peerless Outfit is shipped. We figure, you see that our reputation is largely bound up with your success—yes, with **your individual success,** once you become a Peerless follower. If one Peerless customer should fail at poultry-raising because we did not do all we should have done to help him, we would feel disgraced. So we try to see to it that no Peerless user fails. Our Board of Experts gives advice, counsel, detailed instructions, to any Peerless user who wants them. And the advice is so plain, so explicit, that a child could not misunderstand it. It tells just how to overcome every difficulty poultry-raising has; and it explains fully the methods which have built up the largest poultry-farm in Canada—the great Poultry Yards of Canada, Limited, at Pembroke, where the Peerless method of hatching was perfected and is exclusively followed.

The Best Paying Business You Can Get Into

For the work involved and the money required, poultry-raising, The Peerless Way, is the best business there is. It has possibilities big enough to interest a capitalist; and yet a schoolboy of average intelligence can succeed at it, make money at it, prosper in it, yet start with but a few dollars. There is not a farm in Canada on which poultry cannot be raised for profit; there is not a farm on which poultry will not pay better than any other crop. You simply cannot find a better investment for part of your time or for all of it. Neither can you find a better way to go into it than The Peerless Way. Ten thousand people are doing well with it. So can you.

Let us ship you this and trust you for it. We pay the freight and give you a 10-year guarantee.

We Trust You Willingly

When it is not just convenient for our customers to start on a cash-down basis, we willingly arrange such long credit terms that the Peerless equipment pays for itself—earns its whole cost long before the last payment is due. You will find us very easy people to deal with; you will be pleased and satisfied at every point. Write us to-day.

FREE Big Valuable Poultry Book

You have read enough here to convince you, probably, that there really is something worth while in poultry raising The Peerless Way. Now send for the FREE book that tells the whole story—that clinches the whole argument—that gives facts and figures and proofs—things you want to know, and ought to learn of right NOW. Make a start this very day, Send for the book. Address:

We carry ample stocks in our big distributing Warehouses at Winnipeg, Regina, Calgary, Edmonton and Vancouver, for the convenience of our Western friends. Address all letters to Head Office at Pembroke, Ontario. They will receive prompt attention.

Institute Work in the Annapolis Valley.

Messrs W. H. Woodsworth and L. D. Robinson have been busy for the past six weeks addressing meetings in Kings, Digby and Annapolis Counties. The subjects spoken on have been: Better Fruit, Commercial Fertilizers, Dairying, Soil Cultivation, Rotation of Crops, etc.

Greater interest is manifested in agricultural education this season than ever before and the attendance has been larger than any previous year.

Farmers are realizing, more and more, the importance of systematic methods in their business.

Mr. D. Drummond, of Ottawa, and C. M. McRae have each spent a week in the Valley.

Theological Students Visit the Nova Scotia Agricultural College.

On Thursday, March 24th, the student body of the Presbyterian Theological College, Pine Hill, Halifax, twenty-four in number, accompanied by Principal McKinnon, Ex-Principal Pollock and Professors Stewart, Falconer and Kent, of the college faculty, were the guests of the Agricultural College, at Truro. The public, at least, of the Upper Provinces may better know Pine Hill College from the fact that one of its former principals was President Falconer, now of Toronto University, and one of its former Professors, Principal Gordon, now of Queens College, Kingston. The life of the church, as well as the whole community of the Maritime Provinces, is vitally associated with the condition of agriculture. Not only have the majority of the churches' leading ministers been reared in farm homes, but the really substantial and permanent part of the church constituency is to be found in the rural community. This visit of those who will soon occupy the pulpits of the country implies not alone a recognition of the importance of agriculture, but a desire on the part of the pulpit to effect a greater interest in the improvement of agriculture. No man moulds the sentiment of our rural communities to the same extent as the clergymen and this manifestation of interest in agricultural education cannot, therefore, but lead to a further development of a sentiment in favor of improved agriculture in the Maritime Provinces.

During their visit to the College, these Theologues personally inspected its various departments. They listened to a demonstration in the judging of cattle and horses. They saw personally the herd of College dairy cows that have produced during the past year over 10,000 pounds of milk each in contrast to 3,000 pounds, the produce of the average American cow; and they appreciated the demonstration that such cows as these would more than treble the agricultural wealth of the Maritime Provinces. They saw exhibited in the pavilion high class types of roadsters, carriage, saddle and heavy draft horses and they listened to a discussion as to the importance of these various classes of horses in the farming community. They inspected the poultry plant and learned of the possibilities of the modern hen and they even visited the recently constructed piggery at the College Farm, where they had to admit that, despite the old testament statement about "sows wallowing in the mire", college pigs, at least, when given an opportunity, were as cleanly as any other class of domestic animals. They listened to a lecture in Biology and examined specimens of plants and insects. They studied specimens of leguminous plants and saw the rootlets all covered with nodules and they saw under the microscope the bacteria that exist in these nodules and which make clovers and allied plants such enrichers of the soil. They listened to a talk on improved seed and another on the value and means of increasing the

2 Two Pairs of Hosiery FREE 2

You pay the same price for the hosiery you are now wearing as you would for Pen-Angle Guaranteed Hosiery. Yet it isn't nearly so serviceable as Pen-Angle. We are so positive of this that we **doubly** guarantee Pen-Angle Guaranteed Hosiery to **wear longer** than any other cotton or cashmere hosiery, we care not what make or brand.

This is Our Double Guarantee

We guarantee the following lines of Pen-Angle Hosiery to fit you perfectly, not to shrink or stretch and the dyes to be absolutely fast. We guarantee them to WEAR LONGER than any other cashmere or cotton hosiery sold at the same prices. If, after wearing Pen-Angle Guaranteed Hosiery any length of time, you should ever find a pair that fails to fulfill this guarantee in any particular, return the same to us and we will replace them with TWO new pairs FREE of charge.

Buying hosiery on this plan you cannot lose a single cent. If Pen-Angle Guaranteed Hosiery fails to fulfill the guarantee in any particular we bind ourselves to give you back, free of charge, twice as many pairs as you pay for.

The largest hosiery mills in Canada stand back of this astonishingly liberal guarantee. It will be fulfilled to the last letter.

Remember, the wear is not the only thing we guarantee. The fit, the comfort, and the permanence of the dyes are also guaranteed. Could you ask for more?

Pen-Angle Hosiery is made by an **exclusive** patented p ocess. It is the **only** Seamless Hosiery, made in Canada, that has the **shape knitted** into it.

The ordinary way to make Fashioned Hosiery is to stretch it into shape while wet. Such hosiery loses its shape after one or two washings. 48

Ask your dealer to show you Pen-Angle Guaranteed Hosiery. Our guaranteed lines have a guarantee slip in each box. Pen-Angle trade-mark is on the hosiery, too.

If your dealer cannot supply you, state number, size and color of hosiery desired and enclose price, and we will fill your order direct.

FOR LADIES.

No. 1760. Black Cashmere hose. Medium weight. 2-ply leg. 5-ply foot, heel, toe and high splice, giving strength where strength is needed. Box of 3 pairs, $1.50; 6 pairs, $3.00.

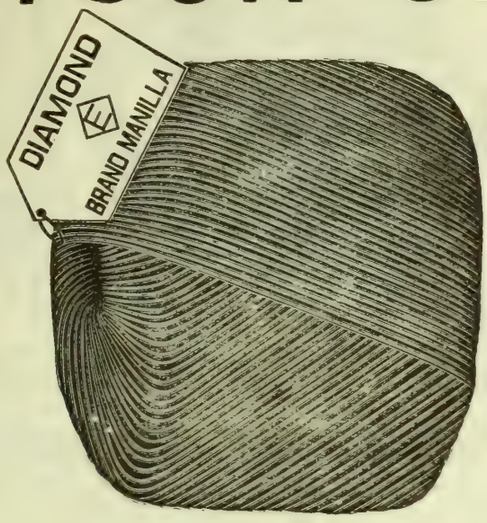
YOUR CHANCE TO BUY BINDER TWINE



THIS CUT ILLUSTRATES A BALL OF DIAMOND Ⓔ MANILLA TWINE, THE KIND THAT WE OFFER YOU NOW AT SUCH A REMARKABLY LOW PRICE.

THE LOWEST PRICE QUOTED FOR MANY YEARS

The highest quality Diamond Ⓔ Manilla Twine is what we offer you. Nothing inferior about it; just a straight bargain offer. Guaranteed strong, smooth, even twine, and absolutely insect proof. Read our guarantee at the bottom of this page—it ought to set your mind at ease.

WE GUARANTEE THE QUALITY TO BE AS GOOD AS THE BEST ON THE MARKET TO-DAY

We want you not only to benefit by this offer but to tell your friends. You'll surely be doing them a favor. A chance like this to buy Binder Twine means a lot to most folks. We'll appreciate your kindness if you but spread the good news around: "Binder Twine, guaranteed quality, at a remarkably low price." That's interesting news to the thrifty buyer.

THERE'S NONE BETTER

It is as good Binder Twine as is made, strong as any made, smooth and even as any made. We say this regardless of make, brand or price. Our Diamond Ⓔ Brand Binder Twine is prepared with special care from the choicest Manilla hemp and first quality long fibre sizal, and is perfectly free from snarls, thin or uneven spots, and will measure 550 ft. to the pound; it is unusually strong, therefore every inch of it can be used.

EVERY BALL IS TESTED

Every foot of Diamond Ⓔ Brand Binder Twine is tested for uniform evenness and tensile strength. We guarantee our Twine to be entirely free from lumps, snarls or thin or uneven spots. Its smooth, even and uniform thickness allows it to be fed smoothly, and positively will not snarl or break, which means much in economy and saving of time.

GUARANTEED INSECT PROOF

We guarantee Diamond Ⓔ Brand Twine to be proof against destruction by grasshoppers, crickets and insects of all kinds, due to a preparation to which each ball of the twine is subjected. This is a very important, desirable and valuable feature and one which you will readily appreciate. We will esteem the courtesy greatly if you will tell your friends who use binder twine, and tell them that we will be glad to supply them with binder twine at the prices quoted in this Catalogue.

IF YOU LIVE IN ONTARIO
THE PRICE WILL BE

8.00 For 100 Lbs.

AND ALL FREIGHT CHARGES PAID BY US

IF YOU LIVE IN QUEBEC OR THE MARITIME PROVINCES
THE PRICE WILL BE

8.50 For 100 Lbs.

AND ALL FREIGHT CHARGES PAID BY US

PUT UP IN 5-lb. BALLS—50 lbs. TO THE BALE, COVERED WITH CANVAS AND LASHED WITH 22 FEET OF GOOD LAID ROPE

LOOK AT THE PRICE AGAIN—THEN LOOK AT THE GUARANTEE

Here are some Reasons why you are absolutely safe in buying Our Diamond Ⓔ Manilla Twine:

BECAUSE—It is superior in strength, will test 135 lbs. or more.
BECAUSE—It measures 550 feet to the pound.
BECAUSE—Every ball carries our trade mark, a guarantee of its excellence.
BECAUSE—Every foot is thoroughly inspected and tested. It carries an evenness throughout which makes it stronger and also work easily on the machine without knotting or breaking.
BECAUSE—Should the twine you buy from us be unsatisfactory for any reason, return it to us at our expense, and we will promptly return your money.

Order Early Send in your order promptly, to-day if possible. If you do not want us to ship the twine at once, say so in your order; state when you will want it, and we will ship it so it will reach you on the day specified—but in all events we would suggest that you order before July 1st. Thus you will have your order in and be sure to have the twine on hand ready for harvest, exactly on the day that you want it.

Our Binder Twine is as good as is made. There is no better twine made than our Diamond Ⓔ Brand Twine. You may pay more for binder twine, but you will not get better quality than ours, for there is nothing better made than our twine. The only difference between our twine and other good twine is the price. It will pay you to send your twine order to us.

Immediate Shipment. We have the binder twine on hand in our warehouse, and will ship all orders the day they are received. There will be no delay in shipping. You can rely on perfect service.

50 Pounds the Smallest Shipment. When ordering, please remember that we do not sell binder twine in quantities less than a 50-pound bale. We do not break bales.

OUR GUARANTEE PROTECTS YOU

We wish you to understand that you

RUN ABSOLUTELY NO RISK

In ordering Binder Twine from us, for if the twine is not exactly as represented, or not full count, or if for any reason whatever you do not think the twine is the best binder twine value you have ever seen after you have examined it, then you can

RETURN AT OUR EXPENSE,

and we will promptly return all the money you sent us, and include any money you may have paid out for transportation charges.

WE TAKE ALL THE RISK,

and if you are not satisfied with our binder twine, return it and

GET YOUR MONEY BACK,

rather than keep it and be dissatisfied, for we want your twine order next year and every year.

THE T. EATON Co LIMITED
TORONTO - CANADA

humus of the soils.

At the conclusion of the day all admitted that they had learned of possibilities of agriculture which they had not dreamt of before. Some even dared to hint that, had they known as much they might have been lead to choose farming rather than theology as their vocation. However, this was not the intention of the visit, for we need more ministers in these Maritime Provinces, as well as in other parts of Canada. It is our belief, however, that every thing which will forward the interest of our rural communities, will forward the interests of the church. Good results are bound to follow this visit of the Theologues to the Agricultural College and Farm.

It is anticipated that in the near future the Theologues of other denominations will also come to Truro as the guests of the Agricultural College and will personally see what is being and can be done for the Maritime Provinces by agricultural education.

RENNIE'S

More Farm Help Needed.

Editor Maritime Farmer:—

I believe your readers will agree with me that the most crying need of the agriculturist, in this Province, is the need of competent assistance on their farms.

As a result of the favorable impression that I have received of the Scotch farmer, as explained at Fredericton, I wrote to the Hon. Sydney Fisher, asking that the Dominion Immigration Department give us assistance to the same extent as it does the Western Provinces. I hoped to have a reply from his department before the Fredericton meeting but on my return home I found the following letter :

Ottawa, 19th Feb. 1910.

"Chas. Peters, Esq.,
Elmhurst, Kings Co., N. B.
Sir :—

"I beg to acknowledge the receipt "of your letter of the 11th, inst, for- "warded to me from the office of the "Hon. Sydney Fisher, Minister of "Agriculture, and to say that any "suggestions the Farmers' and Dairy- "men's Association, at their forth- "coming meeting at Fredericton, may "desire to offer in regard to immi- "gration will be considered as favor- "ably as possible.

Your obedient servant,
W. W. SCOTT.
Superintendent of Immigration."

Now, it is my opinion that we need these people, both to assist us on our farms, in some cases to become managers, and after gaining a little experience and confidence many of them would permanently settle in this country. I believe that by their industry, thrift and good agricultural methods they will succeed where some of our people fail.

There may be some people who do not see eye to eye with me in this matter, and I would be the last to be the father of an impractical suggestion. What I want is the ideas of the farmers of this Province re this matter.

I would suggest then, that the officers and members of the Farmers and Dairymen's Association, and every person, who is interested in this scheme, pro or con, would write to Mr. Scott at Ottawa, giving their needs and opinion.

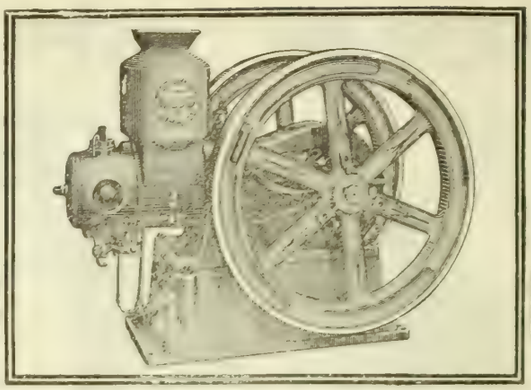
Surely it is worth the trouble to write and the letter goes free.

CHAS. PETERS.
Kings Co., N. B.

Lymphangitis.

Subscriber, writes:—I have a six year-old mare. About five months ago she appeared to get stiffin the right hind leg. After a time the cord near the bag began to swell and in about three hours the leg had swollen to the hoof. She was lame for about three days at the end of which time she did not appear to favor the leg although it was badly swollen and remained so for about three weeks when the swelling began to gradually disappear. The mare is now in good condition and seems to be in good health and is fed and watered regularly and she is not over-worked. What is the cause of the trouble and how should it be treated if it should appear again.

The condition was a mild attack of Lymphangitis or inflammation of the Lumphatus and surrounding tissue, sometimes called weed, shot of grease or Monday morning disease. It usually affects the hind legs. The



Olds Engines

Send for our new catologue.

YOU can learn engine facts you really should know before deciding on your gasoline engine.

The catalogue proves why it is good judgment to own an Olds engine and be sure you have the most practical, most economical, most durable rather than to get a cheap engine and take chances on losing all it costs you.

Besides the highest quality of workmanship and material the Olds Engine has many special and exclusive features. Each one means a great deal to you.

1. Removable water jacket—may save you $100 00.
2. Seager Patent Mixer has not a moving part to wear or get out of order.
3. No gasoline pump of any kind to leak or be primed
4. Cylinders and Pistons of special metal—ground to exact size.
5. Cylinder and head one piece—water cannot enter cylinder.
6. Safety Governor—positively prevents engine's running away.
7. Absolute guarantee—No REPAIR BILLS for the FIRST YEAR.

Tell me what you need an engine for and I will assist in selecting the proper size. Write the nearest office.

JOHN A. BRUCE & COM'Y LIMITED HAMILTON, ONT.

SEED MERCHANTS. ESTABLISHED 60 YEARS.

attack is generally very sudden, and in severe cases it is exceedingly painful and is accompanied by high fever and general disturbance.

Symptoms: First, a chill or shivering fit and uneasiness followed by pain and swelling inside the thigh, near the body, which may gradually extend down to the foot which is at first very sensitive to the touch. In a first attack; the symptoms increase for a day or two and then remain stationary for a few days. Then the pain subsides and the swelling reduces. In severe attacks, if improperly treated, abscesses may form and blood poisoning and death may be the result. In chronic cases, or after repeated attacks, the leg may become permanently enlarged when it is known as Elephantiasis.

Treatment:—Administer a purgative. For a medium sized horse, eight drams of Barbadoes Molasses, two drams of Ginger and one dram Solid Extract of Belladonna ad molasses sufficient to form a ball. For twenty-four hours feed only a light bran mash and often give small quantities of water. After that give, in feed three times a day, two drams of Saltpeter for three days, then twice a day for a week, feeding moderately after the first twenty-four hours. Bathe the leg, as soon as possible, with warm water and repeat two or three times a day. After bathing hand rub well and apply a liniment made by mixing half an ounce of Tincture of Camphor, half an ounce of Liquor Ammonia, one ounce of Laudanum and one pint of water, rubbing liniment well into the painful part. As soon as the pain subsides, give exercise daily and hand rub the leg after exercising. Keep loose in a box stall unless the weather is favorable to turn in a field which is preferable when the horse is not working.

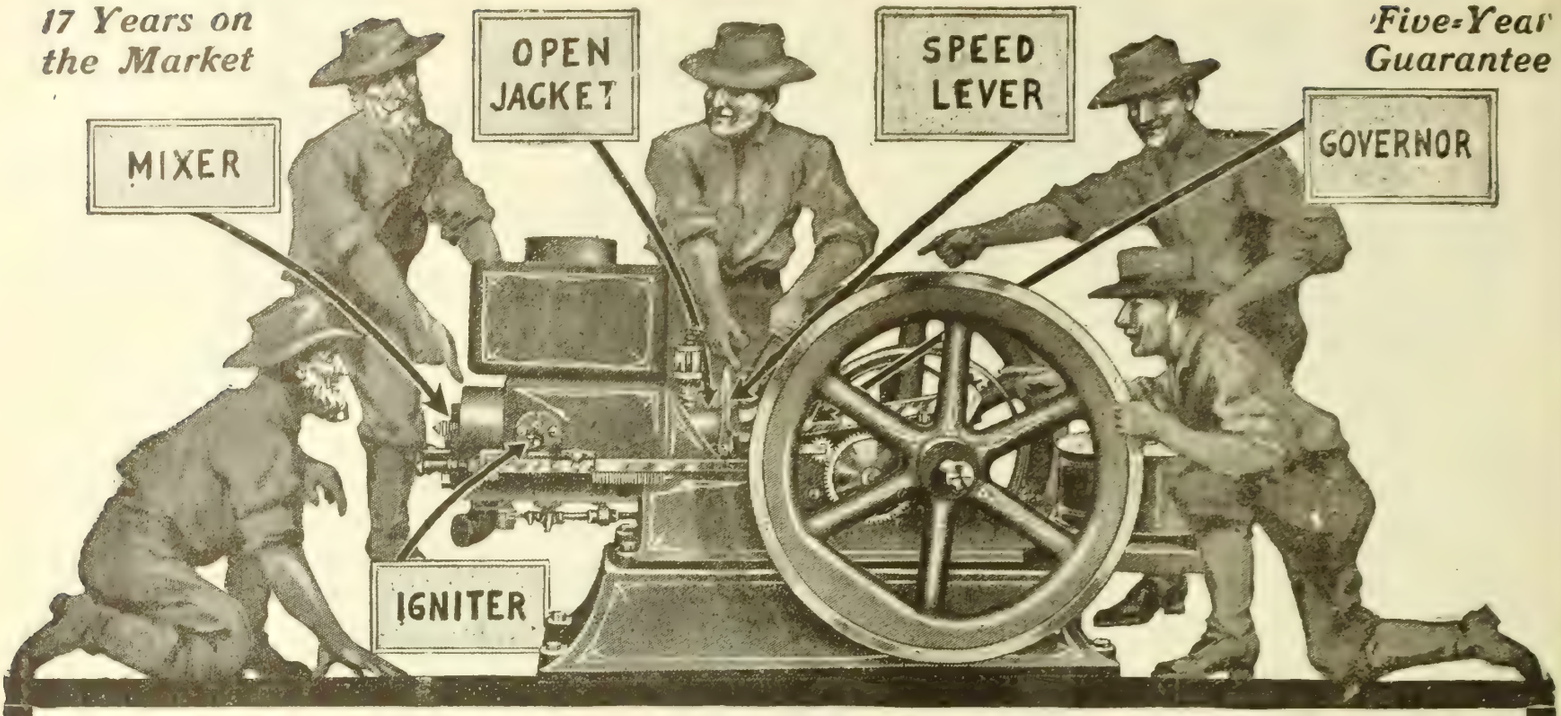
17 Years on the Market

Five-Year Guarantee



Waterloo Boy Gasoline Engines have all the Good Points that go into any Gasoline Engine!

Superior points of their construction are the open jacket, speed lever, governor, mixer and igniter. Our catalog describes these points fully.

WATERLOO BOY ENGINES are practical and reliable. They have few working parts, are so simple that anybody can run them, extremely economical in use of fuel, develop greater horse power than rated.

WATERLOO BOY ENGINES can be started when thermometer is twenty degrees below zero nearly as easy as in July.

WATERLOO BOY ENGINES are backed up by an iron-clad five-year guarantee.

Waterloo Boy Engines are placed in your hands with an absolute five-year guarantee.

These are some of the reasons why the Waterloo Boy Engines are the best for farm use.

Implement Dealer or Catalog House, Which?

Best Service

You are thinking of buying a gasoline engine. You want to buy where you can get the best service, fairest treatment, best goods, for the least money.

We sell Waterloo Boy Engines through Implement Dealers. Every one of our Implement Dealers is our personal representative on the ground. His business is to see that you get a perfect engine, best service, fairest treatment. He is there to help you get the engine started and to see that it works right not only for thirty days after you buy it, but as long as you keep it. If the engine doesn't suit you after you have tried it he will take it back. If it suits you, **we guarantee it for five long years.**

Isn't it worth something to take the engine home the day you buy it? Have your dealer set it up and help you run it and look after it for you? Isn't it worth something to get your repairs from your dealer at the time you need them?

Can you get better service or fairer treatment anywhere else?

Factory Behind the Dealer

Behind our Implement Dealers stands our factory with its capital of $200,000, with its reputation of seventeen years' standing and with its five-year guarantee.

We have a factory big enough to build 100 engines a day or 30,000 a year.

Our Implement Dealers are simply our representatives. We name them a price that makes it possible for them to sell a high-grade satisfactory engine at an exceptionally low price. We put our dealers in position to sell you a Waterloo Boy Engine at nearly the same price that you would have to pay a Mail Order House for an engine that may not be nearly so good.

You and all your friends know who makes Waterloo Boy Engines. Few people know who makes the gasoline engines the Mail Order Houses sell.

Isn't it worth something to know who makes the gasoline engine you expect to buy? Isn't it worth something to know that behind that gasoline engine stands the factory that made it with its reputation to maintain and with its iron-clad guarantee? Isn't it worth something to you to know that even 20 years after you have bought the engine you can get repairs through your local dealer? Isn't it worth something to buy a strictly high-grade Waterloo Boy Engine at an exceptionally low price, and have a man on the ground who is your friend, to look after your interests in dealing with the Company from which you buy your gasoline engine?

When we urge you to buy a Waterloo Boy Engine through our Implement Dealer we are seeking your best good.

If you want the best service, fairest treatment, best goods at the lowest price, write today for our gasoline engine catalog

Noxious Weed Seeds---Learn to Recognize Them

Every Farmer Interested

GOVERNMENT STANDARD SEED.

Purchasers of red clover, alsike and timothy seeds who want a good clean seed should see to it that the seeds they buy are clearly represented by a reliable person or firm to be of first quality, by being marked "No. 1," "Prime," "Fancy," "XXX," or such other designation for which a special standard of purity and vitality is fixed in section 4 of the Seed Control Act.

"Government Standard" is a term coined by seed vendors and may be misleading unless clearly understood. Section 4 of the Act fixes a standard of quality in respect to weed seeds, below which timothy, alsike and red clover seeds are not allowed to be sold for seeding, either by farmers or seed merchants. This standard allows of the weed seeds named in the Act about 90 in one ounce of red clover, 200 in one ounce of alsike, or 4000 in one ounce of timothy seed, It is to seeds that will pass this lower standard but are not sufficiently clean to grade "No 1" that the term "Government Standard" was attached last season.

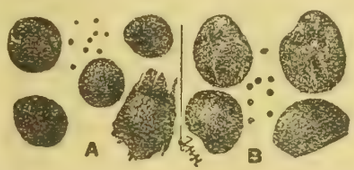
Some seed vendors have advertised seeds under "Government Seal." No Government seal is used on any seeds offered for sale in the trade. Some reliable seed houses sell grass and clover seed sealed by them and for which they alone are held responsible so long as the seal remains intact, but not after it is broken.

To avoid the provisions of section 3 of the Act, which applies mainly to seed grain, some seed vendors represented to farmers that, on account of the Seed Control Act, they are offering their grain for sale for milling or feeding purposes. If offered for sale for seeding, such vendors are required to make clear to intending purchasers that the seed contains wild oats, wild mustard, cockle, and such other noxious weed seeds when they are in the seed. The object of the Act is to protect farmers who want to protect themselves against such weeds. It provides the means for farmers to buy seed intelligently. Farmers who deliberately buy feed grain and use it for seed can scarcely hope for legislation that will protect them from loss on account of noxious weeds.

Strive to protect yourself against the importation of noxious weed seeds by learning to recognize them and by carefully examining samples before you buy.

In a broad sense everything that is not the same seed as that sown is a weed in that field; for example, timothy in a clover field, or any other kind of clover than that sown, or any other plant may be regarded as a weed. We are talking now of weeds, and particularly of noxious weeds; for there are a good many weed seeds in clover which are objectionable, mainly because they oblige the farmer to pay a higher price. These weeds are already so plentiful on the ordinary farm that a small or even a considerable amount found in clover seed will not materially increase the supply of weeds on the farm; but the farmer does not want to pay from eight to ten dollars a bushel for weed seeds which he really has in abundance.

There are several varieties of weeds which are particularly noxious and are not usually found on the farm unless they are imported in clover or some other seed. In order that our readers may become acquainted with the different weed seeds common in clover seed, we give herewith a cut of over thirty varieties, frequently found in clover seed.



Dodder; A, clover dodder; B, field dodder.

A small case, containing a lot of little bottles that contain samples of the different noxious weeds that grow in Canada may be procured at a normal figure from the Department of Agriculture, Ottawa. The Ontario Agricultural College, Guelph, also supplies small cases of weed seed samples for about 25 cents, Every farmer should have one of these for their guidance in seed inspection.

COMMON IMPURITIES OF CLOVER SEED.—1, bracted plantain; 2, black-seeded plantain; ragweed; 4, ox-eye daisy; 5, red clover seed; 6, catmint; 7, crab grass, 8, field dodder; 9, sorrel; 10, dog fennel; 11, chickweed; 12, lamb's quarters; 13, green foxtail; 14, pricklsida; 15, vervain; 16, madder; 17, yellow foxtail; 18, clover dodder; 19, heal all; 20, yellow trefoil; 21, spurge; 22, curled dock; 23, ladie's thumb; 24, buckhorn, rounded face; grooved face shown in 29; 25, mustard; 26, alsike clover; 27, ox-tongue; 28, pigweed; 29, buckhorn grooved face; 30, Canada thistle, 31, campion; 32, wild geranium; 33, peppergrass, 34, camomile; 35, mallow.

The farmer will say: That's all right I can see these seeds very clearly in the illustration, for they are magnified; but how am I to detect them in clover seed? You cannot do it unless you get a magnifying glass. This will cost you from fifty centy to a dollar, and you can get one from your seedsman or at a book store. You need this glass anyhow for examining any number of other things on the farm that you aught to want to look at and your children will certainly want to look at. These cuts will do you no good unless you supply yourself with a magnifying glass of some kind. Now take a sheet of white paper and put a sample of your seed on it. Familiarize yourself thoroughly with these noxious weed seeds. Then take your microscope and examine the sample of grass seed for these noxious seeds. To help our readers in this examination we have had a number of smaller cuts made. The smaller illustrations in each of these smaller cuts show the seed in its actual size.

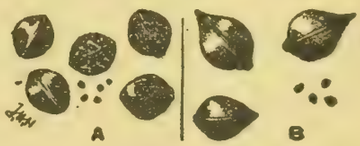
One of the weeds you want to look for is dodder. There are two kinds of it, clover dodder and field dodder. In order that you may familiarize yourself thoroughly with this pest, which has been bought in clover through imported seed, we publish an illustration of each of these, the familiar figures in the cut indicating the natural size of the seed, and the larger ones the size as magnified.

A, buckhorn; B, bracted plantain.

Next in order with respect to its noxious qualities we would put buckhorn and bracted plantain. You will notice in the cut given below these two seeds are much alike, and they are frequently mistaken one for the other. It is not so important that you should be able to distinguish between the seeds of buckhorn and bracted plantain, as that you may know them both when you see them.

A, black-seeded plantain; B, common broad-leaved plantain.

Two of the plantains follow in the next cut, the black-seeded plantain and the common broad-leaved variety. The common broad-leaved plantain is not a particularly noxious weed, and is found more or less on some farms; but the black-seeded plantain is very common in red clover, and is identified not merely by its seed, but by broad leaves and slender flower stalks. It will be noticed that the scar is a whitish spot in the middle of one flattened face, while in bracted plantain the groove on one face is margined with white. None of these can be wholly removed from red clover, and hence samples having these seeds in them should be rejected and never sown where it is possible to avoid it.

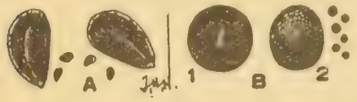


A, sorrel; B; curled dock.

Another of the weeds of which farmers complain is curled dock, a cut of which together with sorrel we give below. Many of our readers have seen a beech nut. The seed of the curled dock is as near like it in shape as anything you are likely to find. It is very easy to pick it out, and it should be kept out of the meadows at all hazards, because it is a deep-rooted perennial and will give you trouble. The last year or two we have had a good many complaints of sheep sorrel, and as it is closely related to the docks, we give an illustration of the seed in the same cut.

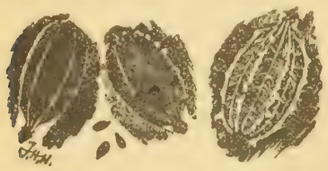
A, yellow foxtail; B, green foxtail.

Every farmer knows foxtail, although we have not been able to distinguish between the two varieties the yellow and the green. We give illustrations of both varieties. The seeds of foxtail are so nearly the size of clover that it is very difficult to remove them. The seeds of yellow foxtail are flat on one side and round on the other; color, brown or yellowish. Green foxtail seeds are brown or straw-colored, the darker ones being mottled and covered with a thin whitish hull.



A, peppergrass; B, mustard; 1, charlock; 2, black mustard.

In various sections of our country there is a good deal of pepper grassand mustard, and it is well for our readers to know the seed, which they can by carefully examining the cut below.



Wild carrot.

Another of the bad weeds coming in lately is the wild carrot, which is found to be one of the worst pests of the clover meadow, many of the eastern meadows being white with it in August and September. It is a long tap root which renders it very persistant; and where this weed has not become established it is important to keep it out by not bringing the seed to the farm in red clover seed. Anyone can recognize it by close examination of the above cut.

A, ragweed; B, ox-eye daisy.

Western farms are plentifully supplied with ragweed, although not every farmer may recognize the seed at first sight. It is important, however, that he should recognize ox-eye daisy, which-while troublesome on some farms, will become more so if farmers are not more careful. It has a beautiful flower, and like as not the good wife, if she finds it in the pasture, will dig it up and plant it in the garden, and call it a "marguerite." In fact, a large proportion of the murguerites sold in the market are simply ox-eye daisy. Therefore it will be well to take a good look at it and see whether there is any of it among your clover seed.

A, Canada thistle; B, dog's-fennel; C, scentless camomile.

We have had a great deal of correspondence lately with reference to Canada thistle, and we would not do our readers justice if we did not enable them to recognize it when they see it It is one of the easiest seeds identified, as will be seen by looking at the cut. We have in the same picture an illustration of our old friend, dog's fennel, and also of camomile, neither of which may be considered noxious, but while looking at weed seeds it is well to familiarize yourself with them.

A, pigweed; B, lamb's quarters.

While you are at it, you might as well get acquainted with pigweed and lamb's quarter, both common weeds and undesirable in clover seed at eight to ten dollars a bushel.

A number of our readers are sowing alfalfa and it is important that they should understand the adulterations

FIG. 22.

FIG. 23.

Fig. 22 A, Alfalfa; B, trefoil.
Fig. 23, A and B, the two kinds of bur clover used as alfalfa seed adulterants.

usually found in the seed. We give first an illustration of alfalfa seed, and in connection with it one of yellow trefoil, which is used as an adulterant, particularly in imported seed, and in addition the two varieties of our clover which are used for the same purpose.

The bur clover grows in California, and it is valuable in that country as sheep feed. The wool is exported to Germany and other European countries, the seeds removed in carding and sold at about two cent a pound to adulterate alfalfa seed sold at from twelve to fifteen cents a pound. If in your sowing of alfalfa you unfortunately get some of

FIG. 24.

FIG. 25.

Fig. 24, A, gum weed; B, sweet clover; C, false flax.
Fig. 25, Alfalfa dodders—A, small-seeded dodder; B, large-seeded dodder.

this foreign seed, the result will be that it will have to be plowed up at considerable expense and loss.

In the next figure we give an illustration of a number of bad weeds that may be found in alfalfa, which need no further explanation. Farmers should be especially careful to examine alfalfa seed for the presence of the dodders that are often found therein. Most of the weeds found in clover seed will also be found in alfalfa, but of these we have already given illustrations.

Drainage pays from Twenty to Fifty Per cent. on the Investment.

Editor Maritime Farmer:—

Dear Sir:—

There are thousands of acres of waste land in Nova Scotia, growing only sedges, rushes and wild grasses, there are alder swamps left because they are too wet to cultivate, then there are thousands of acres that have been farmed for long periods, but have never produced what they should, which might by drainage be the most fertile lands we have and be made to "blossom as the rose." No cultivated agricultural plant will (with few exceptions) flourish in free water and only acquatic plants will.

An English authority says: "There is little of the land of Great Britain naturally so dry as not to be susceptible of improvement by artificial drainage, for land is not in perfect condition with respect to drainage, unless all the rain that falls upon it can sink down to the minimum depth for the healthy development of the roots of cultivated plants."

A report on conditions of drainage in New York sixty years ago said: "There was not more than one farm in seventy-five but that needed draining—much draining, every wheat field would produce a better crop if properly drained," and that no farmer could raise a good crop of grain on wet ground, or in a field where pools of water became masses of ice in winter.

In such cases the grain or clover plants are usually frozen out and perish, or if they survive they never arrive at maturity. Land that requires draining is that which at some time during the year, becomes filled with water that does not find a natural outlet but remains until removed by evaporation. Any considerable addition to its water, wells up and soaks the service and that which is added after it is full must flow off over the surface or lie in puddles upon it. Land that at some time during the period of vegetation contains free water, at least in its subsoil, within reach of the roots of ordinary crops in which there is no free outlet at the bottom, is in the same condition as of a box without an outlet at the bottom, has no means of escape except evaporation. All lands on which the water of heavy rains stands for some time on its surface, needs draining. All lands that contain too much water at any season of the year needs draining. Baking and cracking clay soil needs draining; lands heaving out the plants by alternate freezing and thawing; lands that "puddle" with the spring and fall rains and every heavy rain fall needs draining. In fact all land needing drainage hangs out the sign of its condition more or less according to its circumstances.

Rain is the principal source of moisture and a surplus of moisture is the evil against which we contend. Rain is also a great source of fertility, not only because of its action of dissolving the elements of fertility, but because it contains or brings with it from the atmosphere valuable fertilizing substances. About 41 inches is the general average of the rainfall of Nova Scotia. According to reports this would supply as much ammonia to the soil as three hundred pounds of commercial fertilizer. This ammonia acting on the ingredients of the soil, produces disintergration and renders available the locked-up ingredients which the soils hold. Before these can be used by any plant they must be rendered soluble, this can only be affected by the access of rain and air through the soil. So the rain not only brings water but food for the plants and while the surplus moisture should be removed it should first be conducted through the soil far enough to leave its fertility and not run off as surface water.

Drainage prevents surface washing, by receiving the rains where they fall and at once taking them up. It also lengthens the season for labor and vegetation. It warms the soil by the free passage of warm air and water. The evaporation of water renders the soil cold, a saturated soil that has no means of getting clear of its free water but by evaporation is neccessarily cold. To change water into vapor requires heat that should not leave but be kept there for the growing plants. It is said the evaporation of one pound of water will lower the temperature of 100 lbs. of soil ten degrees and that an underdrained soil is from six to fifteen degrees warmer than soil cooled by surface evaporation.

An open and mellow condition of the soil is always favorable to the growth of plants. Land that is well cultivated and drained will better withstand summer droughts, as they by their underdrains are better able to gather heat, admit air and moisture and enable them to take up the materials on which they live and by which they grow. In a saturated soil every space between the particles is filled with water to the exclusion of the air.

In Great Britain the average annual rainfall is about 20 inches, they have over one million acres underdrained, and they claim that at least one-half of their lands need thorough underdraining, it is clearly seen then how much more underdraining is needed in Nova Scotia when our rainfal, is about double what it is in Great Britain and having much greater heat and a clearer sky the evaporation is very much greater. Hence the greater need of passing the water through the soil by drainage, the character of the soil being the same.

The first cost of draining is what frightens many farmers from attempting it. Draining where it is needed should be regarded as an investment of capital. The farmer's land, stock, implements and his yearly labor are regarded as his capital. All that he can make by the management of these is the profit of his business. But to drain cash capital is required. If he has not this, he need not hesitate long to pay a reasonable rate of interest, if he can see that there is a fair prospect of making a much larger profit than the rate of interest he is obliged to pay. Enough has been said and written concerning the profits of draining to satisfy owners of wet lands that it is better to drain such lands than to spend money in clearing new land or in buying more.

Let the farmer estimate the cost carefully and compare it with the expected gain, then his investigation and figures will show that he does not need the advice of any one as to whether he is right in draining because some one else says to drain.

The evidence of scores of farmers upon the subject of profit is, that draining pays from twenty-five to fifty per cent on the investment.

C. HECTOR CUTTEN.

Patriotic Agriculture

At the evening meeting of the Kings County Farmers' Association held in Berwick on March 26, 1910, Mr. McRae of Ottawa, an authority on horses and live stock, gave an address calculated to inspire the audience, and to move the least enthusiastic member to appreciate the agricultural possibilities of Nova Scotia.

The Berwick Brass Band had just finished playing selections which wound up with "Home Sweet Home" from which Mr. McRae evidently took his text. He began by saying:—

"There are a good many stragglers in the West, who, when they hear the bands play "Home Sweet Home" wish that they were back again. He had travelled much in Canada and the United States and he failed to see where the great Western fruit districts had any advantage over those of the East. The Okanagen Valley was reported to be very wonderful, but there they have real estate men who are hustlers. If those same men wrote up this valley in the same way they write up their own—the people would not know theirown farms!

The Western fellow booms up his own country, in fact there is too much bossting in the West. If you want to build

(Continued on page 457).

Formalin Treatment for Smut.

It is time now that farmers, who intend to sow either oats or wheat, shauld determine whether they are to have from five to twenty per cent. of it destroyed by smut, or have the smut reduced to one per cent. or possibly one half of one per cent. They can do as they like about it, but we wish them to know that it is in their power to get rid of this loose smut at an expense of about five cents an acre, including labor. It is simply a question of whether they are willing to go to the trouble and trifling expense or whether they prefer to take their chances of having their crops—grown on land which they own and pay taxes on or rent—which they plough, sow, harvest and thresh, reduced, in favorable season, five per cent., and in an unfavorable one, twenty, with an average of perhaps ten per cent. There was a time when we were helpless against this enemy of small grain. Thanks to Professor Bolley, of the North Dakota Experiment Station, we are helpless no longer. In treating your oats or wheat with a formalin, you are taking no chances except that of getting formalin of the proper strength and using it in the proper way. The way to do is to buy, from a responsible druggist, a pound of formalin for every fifty bushels of grain you expect to sow. You should put a pound of formalin in forty-five gallons of water, say a barrel. We have heretofore recommended fifty gallons of water to the pound, but find that this is scarcely strong enough. We have also formerly recommended using a gallon of this formalized water to a bushel of oats. This is probably a little too much; probably three-fourths of a gallon would be sufficient. The question now is how to apply it. There are two ways. One is to have two or three barrels partly full. Have your oats in a sack or wire basket; lower it into the barrel and move it up and down enough to get every grain wet. The other way is to take a warm day in the spring, spread your oats or wheat out on the barn floor, say an inch thick, fill a surinkling can with the formalized water and sprinkle the oats thoroughly with it. Then put on more oats or wheat and sprinkle again and so on. When wet, whether dipped or sprinkled, take your shovel and stir it thoroughly, so as to be sure that every grain is treated. Then put it up in a long, slim pile, put some gunny sacks over it and let it remain eight or ten hours. Then remove the gunny sacks and shovel it back and forth until it is dry. This will not interfere with the sowing of oats, either by hand or with the seeder. Can not any farmer go to this small expense and trouble? Which is harder, to do this little job, which can be done any time when there is not freezing weather, but preferably just before sowing, or to lose say ten per cent. of your wheat or oat crop from smut and besides, pollute your farm and be a menace to your neighbor's farm? That is not all. Just for curiosity leave enough seed untreated for an acre, using the same king of seed, sowing the same day and on the same kind of land. Then notice, during the summer, how this acre grows compared with the acre sowed with the oats treated for smut. You will find that the treated oats will start strong in the spring, wil, grow right along, manifesting a vigorous growth all summer, while the others will act as though they are sick. Thousands of farmers have done this at our suggestion, and this is what they tell us. We hope our new subscribers, who have never become familiar with the smut treatment, will take their own experience. Some inquiring boy will ask' "How does the smut grow anyhow?" Smut is a parasitic plant, entirely separate from the oat or wheat plant, and ripening its fruit (the smut spores) before the grain is ripened. Smut could not propagate itself if it did not thus, so to speak, take time by the forelock. The wind blows this off into the sound plants in the same fields or in other fields. This little smut spore gets down between the hull and grain, ready to be sown the next spring; so that it is literally true that the farmer grows smut and must grow it unless in some way he kills this smut without, at the same time, destroying the germinating power of the oat plant. The farmer may say: "I have never seen smut growing on my oat crop." There are a great many things growing right before your eyes that you can't see and don't see; but we do not always need to see things in order to be fully aware of their existence. The subject has been investigated so thoroughly that there is no possibility for any mistakes about it. Someone may ask: "Do all smuts grow in this way?" They all grow within the stock, but they are not all propagated in the same way. Corn smut, for instance, is not planted with the grain. It finds access to the stalk through breaks in the epidermis, or, so to speak, skin of the stalk, and then grows within the stalk, manifesting itself in ways entirely familiar to the farmer. Hence formalin (which we may say here, is formaldehyde, forty per cent.) is of use for oats; but notwithstandno use in treating corn for smut. It ing all that the experiment stations may say, we doubt if it is as effective for the loose smut of wheat as it is for the loose smut of oats and barley. Some readers may ask: "Is there no other way?" The hot water treatment is even more effective than formalin; but the trouble is that it injures the germinating power of the grain and the amount of seed must be doubled in order to secure a full stand. Besides it is much more difficult to treat oats with the hot water er treatment than with formalin. In the hot water treatment, the temperature must not be below 133 nor 138 degrees, Farenheit; and what farmer is going to camp out in the yard or the garden with a kettle of hot water and one of cold, and a thermometer, and monkey the time away treating three or four bushels of oats at a time, losing half the oats? It should not take any man very long to determine what he should do in this case. Use formalin, and look no farther.

Potato Growing.

The potato is partial to good soil, perhaps more so than any other farm crop. Although it readily adapts itself to almost all kinds of soil it is highly important that one of a light nature be selected if best results are sought for. The light soil permits the potato to attain a larger size than it would in heavy ground because the resistance to growth is less in the former case.

A fertile sandy loam, well supplied with decayed plant material and with a good natural drainage, is quite desirable for a good yield. Heavier soils may be readily made available for potato raising by proper drainage, by a generous application of barnyard manure, or by plowing under green crops. Heavy clay land is the poorest kind for growing this crop, and should not be used if the farm has a tract of lighter soils. will te,l you the type and variety Exuerts claim that a better quality of potato can be grown upon a sandy soil than upon any other; to be sure there must be sufficient organic matter present to add fertility.

The 1909 Agricultural Report for Nova Scotia contains the following advice on potato fertilizing:

"In the article on potato growing by John Donaldson, the following mixture per acre is recommended for potatoes:

75 pounds nitrate of soda.
300 pounds acid phosphate.
150 pounds muriate of potash.

"If the farmer has bought these three standard fertilizers, he could easily weigh out the exact number of pounds stated, or a proportionate number of pounds, on a barn floor, and with a square mouth shovel he could very easily make an even mixture of these. About the only difficulty he would experience would be that the nitrate of soda might be some what lumpy. To overcome this, a number of farmers could club together and buy a small hand power fertilizer grinder. However, for ourselves, we have found no difficulty in breaking up the lumps by means of a post or rammer similar to that which one would use in preparing a foundation for a cement floor. Aenerally, we would advise applying very shortly after mixing, for if allowed to stand for some time, such a mixture may again become lumpy. This mixture is a very concentrated one, and would cost about $33 per ton. It will contain as much plant food as the average $40 mixture. Owing to its concentrated character, it should be applied as evenly as possible Some would recommend adding 25 per cent. or more of gypsum, which would make the mixture more bulky, and would be of value on any lands requiring lime. We, ourselves, would usually mix with the above 200 or 300 pounds of bone meal, and perhaps an equal quantity of basic slag, and if our larm were deficient in barnyard manure, which supplies organic nitrogen, we wodld add 200 or 300 pounds of blood meal, or tankage, or fish refuse as a source of organic nitrogen. We would apply the mixture, as completed, at the tate of from 500 to 1,000 pounds per acre, depending upon the richness of the land.

"Many other mixtures might be recommend any benefit proportions commend any hefinite proportions for the reason that we believe that every farmer should experiment and ascertain for himself. The following, however, are some mixtures High Grade English Potato Mixture. which have elsewhere given good results:

	Lbs	Cost About
Sodium nitrate	250	$ 7.50
Sulphate of ammonia.....	250	8.00
Acid phosphate 1150		10.35
Sulphate of potash.....	250	8.75
Total .....:	2000	$35.60

"This mixture contains 4.2 per cent. nitrogen, 7.5 per cent. phosuhoric acid and 8.5 per cent. potash, all of which are immediately available. If one were using considerable barnyard manure and had plowed under a clover sod he could use a smaller amount of sodium nitrate and sulphate of ammonia."

Rotation of crops has a decided influence on the potato crop. It is also quite important that the mechanical make up of the soil be favorable. The potato requires an abundannce of moisture, the most of which must be withdrawn from the surrounding soil. The moisture holding properties of the soil depends upon its mechanical condition, and this in turn, upon the method and time of plowing, mixture with organic substances and suitable fertilizers. The presence of humus is one most essential factors in the way of proper soil preparation for the potato, as it aids in holding moisture, stores heat and renders available nitrogenous matter for the potato's use.

Potatoes should not be followed immediately by a second crop of potatoes, as the soil needs the change and rest brought on by proper rotation. A successful potato grower recommends as a three year rotation clover, potatoes, wheat.

In regard to plowing; Early breaking is most advantageous as it will exterminate the pestiferous insects, chief among which is the grub worm, and will make the ground solid, through settling, before the seed is ulanted, thereby insuring a moisture retaining stratum of earth to offset the evil effects of possible drodghts.

The seed potatoes should be selected with great care. Burbank's method is by far the best and most sensible. It is as follows: When digging potatoes select the seed from what were the most thrifty stalks and from the most promising looking tubers. Carry your seed basket into the field and gather the best potatoes from the best producing plants. If this is followed faithfully there will never be a shortage in the potato crop as far as the seed is concerned.

The seed potato should be cut into pieces large enough to contain at least two eyes, as a great deal of the vitality depends upon the size of the piece. After being cut they should be planted within twenty-four hours for satisfactory results, although it is known that the seed pieces can be kept for several days in proper storage conditions without injury.

Potatoes should be planted at a depth of 4 inches, and from 12 to 15 inches between seed pieces, in rows about 3 feet apart. Of course, where the drill is used these conditions will vary. With the earlier varieties it is best to plant them as soon as possible after the danger fromfrost is over. Before the sprouts are above ground it is a very good plan to harrow the ground several times. This will save an after struggle with weeds and loosen up the crusted surface to allow the new shoots to come through better and easier. After the potatoes have gotten a fair start, set the cultivator to work and keep it going at intervals of seven days until the vines shade the land, and nature will do the rest and reward you with a good harvest.

Some of the old standard potatoes were deep eyed, coarse, watery and of variegated colors. Farmers who persist in growing these varieties which have been discarded as unsuitable for market requirements find it a difficult matter to dispose of their crops; dealers do not want to buy such potatoes at any price, and not infrequently one may see a farmer returning to his farm from the railroad station or steamboat landing, with his load of potatoes, because the dealer found they were of a quality that he could not place on the market.

Grow white varieties that are smooth skinned, shallow eyed, mealy and of uniform size. If you have not already procured your seed potatoes inquire of your dealer and he will tell you the type and variety he could handle to the best mutual advantage. It is simply folly to grow varieties that are not saleable. Green Mountains, Delewares and Irish Cobblers are some of the most popular main crop potatoes. If you grow these varieties or some others like them you will have no difficulty in disposing of your potato crop.

New varieties are produced, every year, generally from the seed balls; but very few of them attain any degree of usefulness or popularity.

Potato culture cannot be carried

MAKING MEN GOOD BY LAW.

So often has the statement that "you cannot make men good by law" been repeated that some men have come to believe it true. Yet all law is for the purpose of making men good, and if the statement be true there is no need for laws.

The law does not deal with the consciences of men, directly. Only acts are forbidden and punished. Thoughts, purposes, intentions, motives, are not punished. Sometimes motive is important, to determine the quality of the act; but the act alone is punished.

It is the purpose of the law to make men good; and if the statement quoted be true, then all law is a colossal failure. But we know that some men are made good, relatively, by law. Some men are restrained in desire to commit thefts. Some are restrained in desire to commit murder. Others are restrained in desire to commit other offenses. The purpose of the law is to prevent the commission of crime, or to compel men to do what is right. And men who refrain from doing wrong by reason of fear of the law ; and men who do right because they fear not to do so; are better for their actions, regardless of desires.

The direct action of the law which compells men to do right, and which prevents them from doing wrong, is moral in effect, and in this way men are made better by law. There is an indirect effect of law which tends to make men better. When society has condemned an act, and has denounced it by law, every good citizen upholds the law, and does not hesitate to condemn the act denounced. The moral effect of this is great, and in time people come to regard the act as so immoral that they condemn the man who commits it. This is what we call public sentiment, or public opinion. We all know the immense power of "public opinion."

There was a time on the frontier when theft of horses was not punished. It was dangerous to condem it too openly. And there was also a time when human life was held to be of little consequence. The "gun man" and his friend did not allow much discussion. Theft and murder were all too common. When society became strong enough it put the thieves in the penitentiary; and the "gun men" were either hanged or they sought other locations. Now, does anyone believe that "moral suasion" brought the desired changes ?"

By the time society was able to maintain the law, sentiment had changed, and public opinion had made the horse-thief and the "gun man" unpopular. But could society have brought this change in opinion without the strong arm of the law?

Whatever is injurious to society may properly be prevented by society. This is because society has the right to protect itself, and the rights of its members.

You may not be able to make a man virtuous by statutory enactment ; but if a man has a desire to kill you, and if the law restrains him in this desire, then so far as you are concerned, he has been made good by law. With his conscience the authorities may not concern themselves, but the law makes his evil passion of no effect against you ; and so you are safe, under the protection of the law.

The same may be said of every act which would injure another, when the act is denounced by law. The power of society to protect itself is limited only by the necessity. Whatever is necessary to be done may properly be done. No one can have the right to do an act which will be evil in its consequences to society.

We are told, sometimes, that the law cannot restrain certain acts; and that efforts to restrain certain acts have always been futile. Now, if there be any acts which are evil in their effects upon society, then society should restrain those acts. and if the people who committed those acts declare that the law cannot be made effective against them, then the need for action becomes great, and the need to restrain such men in their evil acts is of great importanne. Such acts, accompanied by such declarations, show want of respect for law, and for the rights of society. Such declarations are as if the man who made them should say, "We are above the law, and shall do as we please, without regard to the rights of society."

In a land where license does not prevail, and where civil liberty is valued, no one should be allowed to place himself above the law; or to defy the authorities who are charged with enforcement of of law. If many people did this there would not be civil liberty, but anarchy ; and what many men may not do, a few should not be permitted to do.

It would be well if everyone should draw the clear distinction between civil liberty, which is the creature of the law, and license, which is either without law or in defiance of law. Savages have that natural liberty which many profess to desire, but which is not of great value ; but civilized people have civil liberty, which can only exist when the rights of all are safeguarded by law.

If we will think out the subject for ourselves we shall find that our greatest liberties would be impossible without law, since those who are stronger than we could at any time take away our liberties, or so treat us as to make them of little value.

Some men do not need law to compel them to be good, but there are others who need the law to restrain them; and all men need the direction of the law, since otherwise each man's conscience would be his law. And of consciences there would be variety.

The men who declare that "men cannot be made good by law," are generally men who do not wish to be restrained in evil-doing ; and for these the need for wholesome restrain is greatest.

THE MEASURE OF SUCCESS.

The measure of success in this world lies in the man not the occupation. To-day with high prices prevailing for food products the officers of our Building and Loan Associations tell me that the laboring men are, as a rule, meeting their payments promptly, yet the averagd business man finds it hard to harmonize the problems. It is the man who counts the cost and brings his expenses within his income who succeeds and this has a world wide application. In every industry it is the maximum product produced at minimum cost which must be sought. The man who grows an acre of potatoes if he follows general practice will put in, in the form of labor, seed and fertilizers, from eighty to eighty-five dollars. He must be seeking the maximum product in order to realize. Two hundred bushels will hardly cover expenses unless prices are exceptionally high. It is a simple proposition to put this on paper, but skill, labor and intelligence alone can work out the problem. The principle is right but each individual must find the solution for himself. This explains why, in all industrial life, so many wrecks are found, so many shops, mills, factories are deserted, so many failures reported. The trouble is not with the industries but the individuals, for right alongside other individuals in the same lines of work reap success.

The panacea lies not in legislation to force others to change but in seeking to find the largest output per animal, or acre, or tree, at the lowest cost. One swallow does not make a summer and one failure or success does not settle the question. It takes a series of years to balance the accounts properly but meanwhile there can be no let up in the demands on the individual to seek to grasp the details of the whole problem.

There's no easy road to success in this world and never will be, but he who counts the cost, and lives within his income is always safe. The struggle comes in trying to lift the income and that struggle is universal.

IMPORTANCE OF GOOD FARM MACHINERY.

Much of the great progress made in agriculture within recent years has been due to the use of improved farming implements. Since farm machinery has come into general use, much of the drudgery of farm life has vanished. As a result, there has been a great improvement in the social and economic conditions of rural society. The judicious use of improved farm machinery enables the planter to cultivate more land, till it easier and do better work. It is much easier to operate a labor-saving machine than to bend the back from dawn till dark with a hand tool. Besides, there is always a stronger motive for doing good work when strength is saved. Where the work is irksome, enthusiasm and interest are apt to be lacking.

The proper use of labor-saving tools has greatly increased the earning capacity of the American farm. The working day of the farm hand has in most cases been shortened and more opportunity given for recreation and study. This fact is noteworthy. Improved tools, intelligently used, mean more and better crops.

Farm machinery requires intelligence. Wages has therefore gradually increased. Men qualified to operate machinery usually have employment and receive fair wages. Hands are more efficient and. consequently, become more proficient by the use of good tools.

The evolution of farm machinery has elevated woman from a producer in the field to a home-maker. In every country where crude handtools are used, woman has been forced to work in the field. Today, when it becomes necessary for a woman to earn her own bread on the farm, it can usually be done without impairing her health.

Good labor-saving implements do much to make farm life attractive to boys. They naturally like to operate machines and usually take pride in the handling and care of tools. Good implements are necessary, and no farm should be without them. They save money.

EDITORIAL NOTES.

Breed up, not down. Breed to something better than you already have. Breeding a mare to a stallion only her equal, is standing still. Breed to the best within your reach. In the end breeding up means profit and progress, while breeding down means loss and retrogression.

Some Thoughts for Maritime Potato Growers.

President Brown, of the New York Central, told the Cornell University farmers recently that the average acre yield of potatoes in Maine, mostly on recently forested land, is 225 bushels, against 82 bushels in New York. A more startling proof of soil exhaustion could scarcely be offered.

Unfortunately, the "World" did not give the reply of the "Cornell farmers" to this observation of the great railroad magnate. Readers of agricultural reports and persons conversant with agricultural matters in general, know what such "soil exhaustion" means and how readily such a condition of the land can be remedied. They are aware that progressive and up to-date methods of intensive farming are practiced by many farmers in the Pine Tree State. Their sandy soil, whether recently forested or otherwise, would not yield them a comfortable living, if they did not feed it and cultivate it in the way they do. They have learned long ago that "Nothing from nothing leaves nothing." They also know that plants, like all other living matter, have to feed in order to keep on living and growing and bearing fruit, and that they have to find the food they need in the soil. Where sufficient amounts of plant food, in readily available form and in proper proportions, are not within the reach of the feeding rootlets, the plant starves, wilts, dies; there is no crop.

The intelligent farmer, therefore, take good care to put into his soil all the plant food the crop needs, and cultivates his ground until it is in such a shape that the tender feeding rootfibres can easily spread through it in search of the plant food elements, find plenty of what they are looking for and absorb it, and grow and thrive in proportion. These plant food elements are: Nitrogen, phosphoric acid and potash, which, in a sense, are as essential to the plant organism as water, oats and hay are to the horse. As the horse needs these three essentials to maintain his strength, and as he would perish if one or the other of them would be withheld, no matter how bountifully the remaining ones were supplied, so the plant needs nitrogen, phosphoric acid and potash, and these elements the farmer supplies to his crop in commercial fertilizers. They are also contained in barnyard manure, but not in well balanced proportions; hence the exclusive use of stable manure cannot replace all the elements, nor the total quantity of plant food taken from the land with the crop.

Cultivated crops require varying amounts of each element. Potatoes, for instance, are voracious feeders of potash. The fertilizer applied by Maine farmers to their potato fields contains as much as ten, and even more per cent. of this element. Other crops need more phosphate; still others must have an abundance of nitrogen. Herein lies the explanation of the fact that the land becomes more quickly exhausted, where only one crop is grown year after year on the same land; while an intelligent rotation of crops assists materially in maintaining the fertility of the soil.

Therefore, if the Maine farmers reap greater harvests than the New York farmers, it would indicate that the Maine farmers are more thorough in their work, more liberal in their treatment of the soil. Such a thing as "exhausted soil" should not be tolerated by up-to-date farmers, who have mastered the science of farming and have learned that any kind of arable land, no matter how poor or "exhausted" it may be made to yield rich crops by proper tillage, liberal applications of commercial fertilizers containing potash, phosphoric acid and nitrogen, in proper proportions as required by the soil and the crop, and an intelligent rotation of crops.

Granting these premises, any New York farmer can do as well, and better, as the farmers in any other State in regard to potatoes or any other crop.—H.E.H. in Maine farmer.

Value of Farm Manure.

Barnyard manure when properly saved and liberally applied is one of the most valuable assets to the farm. It improves the physical condition of the soil by adding humus and thereby greatly increases its water-holding capacity; it adds plant food to the soil; it makes the plant food already stored up in the soil more available; makes the soil warmer and accelerates the action of soil bacteria. While the amount of nitrogen, phosphoric acid and potash is not large, the effect of barnyard manure makes it the most valuable of all fertilizers.

The composition of manure is quite variable, depending upon the kind of animal, the age of the animal, the kind of food eaten and the care of the excreta after it is voided. For example, feeding cotton seed meal, bran, corn and other rich foods, make the nitrogen content higher. In general practice on the farm the droppings from all the animals are collected and thrown into a heap. If the urine is saved we may estimate that a ton of well-kept manure will contain plant food constituents as follows: nitrogen one-half per cent, phosphoric acid one-third per tent. and potash one-half per cent or 10 pounds each of nitrogen and potash, and six and two-third pounds of phosphoric acid. Estimated alone at price of the nitrogen, phosphoric acid and potash, a ton of barnyard manure is valued at about $2.72.

It is estimated that a horse of average weight will consume about 24 pounds of dry matter a day and make about 50 pounds of manure a day. The cow will use ordinarily about 25 pounds of dry matter in her food and void about 95 pounds of manure daily. It is estimated that a sheep that weighs about 125 pounds will produce 5.4 pounds of manure a day. From the above data it is an easy matter to calculate the amount of manure that can be saved on your farm. If the horses are in the harness a portion of the time, and the cows are in the pasture a part of the day, suitable reduction must be made.

A knowledge of what the manure contains is of much importance to the practical farmer, since this information will enable him to apple the manure more intelligently, and when necessary, supplement it with commercial fertilizer. To determine more accurately the amount of plant food in the excrement, it is necessary to consider the composition of the food given to animals. Tables giving both the feeding and fertilizing value of feeds are published by most of the state stations and the Dominion department of agriculture, and are free for the asking. For practical purposes it is safe to say that the dairy cow voids 80 per cent of the fertilizing constitutents of the feed; fatting cattle or hogs 90 per cent. By the manurial value of the bedding material which, also, in most cases, may be found in the bulletins referred to, the plant food may be estimated with considerable exactness. Then the important question is to keep the manure from deteriorating in value after it is voided.

The manure from the horse is regarded as the most valuable, but it is more difficult to keep. It is richer in nitrogen than that of the cow or hog, contains much vegetable matter and consequently it is apt to lose by fermentation. It is especially suitable for hot beds, also for damp, cold soils. Care should be exercised to keep it damp and prevent it from heating and becoming "fire-fanged."

The manure from cows contains more water, less organic matter and less plant food than that of the horse or sheep; nevertheless, it is valuable. It can be kept with less danger of loss and when thoroughly decomposed is highly recommended for the garden.

It is usually found advantageous to mix the excrement from all of the animals on the farm, as it can be better handled and applied to the land more conveniently. The mixture gives more even temperature and makes the plant food elements more nearly balanced.

The Value of Seaweed.

Seaweed is often looked upon as a waste product, but, instead of being of little or no value, it is esteemed by those who have used it as a most valuable manure, either when used by itself or mixed with stable or farmyard stuff. Many seacost gardeners are aware of the utility of seaweed for dressing beds of asparagus, seakale, artichoke, and some other vegetable crops, but they do not seem to know that, moderately used, it has a most beneficial effect upon fruit trees, especially apples and pears, also upon grape vines.

It is true that some market gardeners residing near the seashores go to the trouble of gathering and carting on to their land small quantities of this material, but an immense amount of it is allowed to be lost by being washed back again into the sea, to be covered up with sand, or allowed to rot on the beach and become offensive in many ways. In dry seasons it makes an excellent mulching material, perhaps better even than stable manure, and certainly better than many other things which are used. It is recorded that some land which has been reclaimed from the sea had been converted into a garden which grew excellent vegetables, flowers and fruits. There was a great depth of sandy soil, and this was composed to a great extent of sand and decayed seaweed. It appears to be of more value in light than in heavy soils.

Seaweed varies considerably, some being far too coarse and heavy for the purposes mentioned, unless it has first had time for its partial decomposition. Preference is given to that of a finer and lighter character, which, when collected, generally contains a fair amount of sand, making it more suitable in every way for use in the garden, whether it be for asparagus, fruit trees, or even as a plunging material for pot plants during the summer months. We have no statistics available respecting the comparative value of seaweed with farmyard or artificial manures, and, as before stated, the value of the various kinds of seaweed must differ a little.

When burnt, and the ashes applied to the ground, it is good for all kinds of cereals. Seaweed is sometimes suffered to ferment before it is used, but this process is by some thought unnecessary, for there is no fibrous matter rendered soluable in the process, and a part of the manure is lost. A common plan is to mix it with stable manure, and let it lie for a while before using. The best results are generally obtained when used as fresh as it can be got. Some seaweed, which had been fermented, so as to have lost about half its weight, afforded less than one-twelfth of mucilaginous matter, from which it may be fairly concluded that some of this substance is lost in fermentation. The benefits of seaweed do not extend beyond one or, at the most, two years.

Injury to Crops by Freezing and Heaving of the Soil.

Reports from several localities indicate that winter wheat, other winter grain, alfalfa and other crops are being injured by the freezing and heaving of the soil, This heaving results from the alternate freezing and thawing of very wet ground. Certain types of soil which contain considerable clay and hold water are more subject to heaving. Often the whole furrow slice is lifted, doubtless due to the fact that the water tends to accumulate at the bottom of the mellow soil and freezing lifts the soil above; also the cleavage line may be nearer the surface. The lifting of the soil by freezing breaks the roots of the wheat and other plants which may be growing on such land. When the soil thaws it tends to settle, leaving the upper parts of the plant roots exposed above the ground, and the continued alternate freezing and thawing gradurlly draws the plant roots out of the soil.

As long as the ground is very wet and the alternate freezing and thawing continues, nothing can be done to stop the heaving. As soon as the frost goes out and the ground becomes dry enough some benefit may result from rolling—by settling the soil and pressing the soil more firmly about the loosened roots. A heavy, smooth roller is preferred for this work. It is not advisable to harrow wheat which has been injured by heaving, since the harrowing is likely to pull out many of the plants and still further loosen the roots of those which remain.

It is almost impossible to prevent injury by heaving in certain heavy, waxy types of soil. Well-drained land is not thus affected, and even in ground which is subject to heaving it may be largely prevented by good surface drainage and veay careful preparation of the seed-bed. The seed-bed which is prepared late and left in a loose, mellow condition, especially if some trash of manure has been plowed under, is much more apt to heave than the finely pulverized, well-settled seed-bed. If the plowing precedes the planting by a long intervale, so that the soil becomes settled and a good union is established between the furrow slice and the subsoil, than the heaving is much less apt to occur.

It has been shown by the experiments at this Station that the careful preparation of the seed-bed by early plowing and sufficient surface cultivation so as to pulverize and settle the soil results in largely increased yields. It is doubtful whether the injury by heaving to wheat or other grain, which is now occurring in some fields in certain localities in the State, can be prevented or remedied to any extent. Timely rolling may help a little as suggested above. But this damage to the crops may be a lesson to the farmers so that they may in future plantings take greater precaution in putting the soil in the best possible seed-bed condition before planting the crop.—A. M. TENEYCK, Agronomist, Kansas State Experimental Station.

The Swarms of Bees Act.

The following act respecting the right of of property in swarms of bees has become law.

1. This act may be cited as "The Swarms of Bees act."

2. Bees living in a state of freedom shall be the property of the person discovering them, whether he is or is not the proprietor of the land on which they have established themselves.

3. Bees reared and kept in hives shall be private property.

4. (1) When a swarm of bees leaves a hive, the owner may reclaim them, so long as he can prove his right of property therein, and shall be entitled to take possession of them at any place on which the swarm settles, even if such place be on the land of another person, but the owner shall notify the proprietor of such land beforehand and compensate him for all damages.

(2) If a swarm settles in a hive which is already occupied, the owner of such swarm shall lose all right of property therein.

5. An unpursued swarm which lodges on any property, without settling thereon, may be secured by the first comer, unless the proprietor of the land objects.

6. If the owner of a swarm declines to follow the swarm, and another person undertakes the pursuit, such other person shall be substituted in the rights of the owner, and every swarm which is not followed shall become the property of the proprietor of the land on which it settles, without regard to the place from which it has come.

HORTICULTURE

The Use of Bordeaux Mixture.

Some important things about the use of Bordeaux mixture have been determined through experiments conducted by the Illinois Agricultural Experiment station and recorded in bulletin No. 155. A few of them are :

1. Injury to foliage of apple trees following application of Bordeaux mixture is of common occurrence. Much of the injury reported or observed is preventable. The principal sources of injury as determined by observation are :—(1) Use of impure or improper materials. (2) Carelessness in making the mixtures. (3) Improper and ineffective application.

The first two of these sources of difficulty can be entirely eliminated and the third greatly mitigated by reasonable attention and supervision. Formulas must be respected and small details of practice must receive attention in order to attain best results. But when all precautions have been taken injury sometimes results. These non-preventable injuries are associated with unfortunate weather conditions and particularly with the action of rain and dew.

2. The adhesiveness of Bordeaux mixture depends very much upon the manner of making and upon the character of the lime used. Variation in the proportions of copper sulphate and lime beyond certain well-defined limits decreases adhesiveness. With lime of good quality a close approximation of equal parts of copper sulphate and lime gives greatest adhesiveness There is decided advantage in the maintenance of an excess of lime upon the foliage, but this must be accomplished by subsequent applications and not by increasing the amount in the original mixture.

3. No definite experiments regarding the accumulation of copper in the soil under sprayed trees have been conducted, but from results reported of experiments of others it does not appear that there is danger from this source. There is no evidence at hand that in any way associates browning or yellowing of foliage with copper in the soil.

4. The two classes of leaf injury considered are, "brown-spotting" and "yellowing." Brown-spotting is the more common injury. Yellowing, when it appears in epidemic form is the more serious of the two because affected leaves are entirely destroyed. Not all brown-spotting is due to spraying. Other causes are, frosts, winds accompanying cold spring storms, fungi and insects. Leaf injuries are most common and most serious in neglected orchards.

5. The ideal spray compound that is perfectly effective and at the same time perfectly harmless, on all occasions and under all conditions has not yet been discovered. Bordeaux mixture most nearly approimates the ideal, but its harmlessness can not be absolutely depended upon.

6. Injuries to foliage do sometimes follow applications of Bordeaux mixture and appear to be unavoidable. There are differences of opinion as to the exact manner in which injuries are inflicted.

7. The value of Bordeaux mixture as a fungicide depends upon the contained copper. The action is preventive and not curative. It follows that early application with the one aim of defence gives infinitely better results than later application intended to check ravages already begun.

8. The causes of yellowing of leaves of apple trees are obscure and not well understood. From observation extending over five seasons it seems certain that there are several causes which may operate singly, or together. Recurrent epidemics of yellowing appear to leave no direct relation to wet or dry periods, or to other weather conditions. The experiments made do not establish any direct and positive connection between spraying with well made Bordeaux mixture and yellowing of leaves, but do show that improperly made mixtures may cause yellowing results from use of simple solutions of copper sulphate.

9. Healthy bark of apple trees is impermeable to Bordeaux mixture and solutions are absorbed through wounds and promptly kill the leaves which then become brown. Numerous experiments in which copper sulphate and solutions were injected through roots and through holes bored in trunks of trees, uniformly resulted in browning of leaves. The copper penetrates to the leaves as was determined by analysis.

10. The importance of rain and dew as agents causing brown-spotting of foliage following applications of Bordeaux mixture is well attested by the uniform results obtained from the experiments with covered and uncovered trees. Two trees were sprayed heavily; one was left exposed, the other was prtected from all rain and dew. This was repeated during three seasons. In each year the foliage of the exposed tree was more or less injured by brown spots, while the tree protected from rain remained free from injury. Several other experiments in which trees exposed to rain were brought into contrast with trees protected from rain gave, in all cases, the same results, namely, some degree of injury to foliage exposed to rain and absolute freedom from injury to the foliage of trees protected from rain.

11. Milk of lime does not cause brown spots even when applied in large quantity, but burning quickly follows applications of copper sulphate solutions even when the solutions are very dilute. It is therefore concluded that copper in solution is the active agent responsible for the burning of foliage.

12. Bordeaux mixture has a decided influence upon the color of leaves. Under a coating of Bordeaux mixture leaves assume a very dark green color that is retained even after the coating is mostly washed away. Leaves coated with lime only become in some degree darker in color than untreated leaves, but the shade is not so deep as is assumed under a coating of Bordeaux mixture.

Money in Strawberries.

"My strawberries have yielded me $300 an acre for the last four years, but as I have only four acres there is no danger in my making a fortune."

The speaker was a woman who owns a small farm within twenty-eight miles of New York city which she works and manages according to her own ideas. While her berries and vegetables are always up to the standard she makes no pretence that they are the best in the market or that she receives more than the regular market prices for them.

"In the first place," she went on, I believe that the land for strawberries should be as carefully prepared as that for the tenderest vegetables. After my land has been properly prepared and fertilized I make rows for strawberries about three and a half feet apart in the row. This, I believe, is called the single plant system among marketmen.

"The runners are placed from four to six inches apart in the rows and all other runners are kept cut off during the season. This is not as cheap a method as the matted row system, but it will insure finer berries, and I have found that in the long run it more than pays for the added expense in time and money.

"One thousand pounds of good fertilizer is not too much for an acre of strawberries, and I ordinarily use about that amount. Of course the land has to be tested to find out just what fertilizer is required for growing berries. One of the mistakes commonest among growers of small fruits and vegetables is thinking that the same fertilizers should always be used for the same crops.

"My favorite varieties are the Marshall and the Gladys. I have made as much as $103 from a single picking of Marshalls from one acre of ground.

"One of the problems of raising strawberries in this climate is protecting the plants during the winter. I have used both a mulch of straw and one of coarse horse manure. While the manure has the advantage of giving additional fertilizer to the plants during the fruiting season I think I rather prefer to add manure in some other way and keep the straw for mulching.

"The gross earnings of my strawberry patch are about $500 an acre. The cost of producing and marketing the crop is in the neighborhood of $200 an acre, which leaves me a clear profit of a little more than $300 an acre. I have two neighbors who make a larger profit on their berries, but on the other hand I also have several who make considerable less.

"I consider my farm a good investment because it earns me a good living for the time and money expended. If it was a man's farm I don't believe it would be considered remarkable, but because I am a woman and prefer to have things my own way people ride miles to see it and ask about my experience.

"It is my experience that no small fruit crop pays as well near a large city as strawberries under favorable conditions. What I would call unfavorable conditions would be severe drouth, the presence of the white grub and the rust, or leaf blight. Any of these cut off a crop of berries below the profit margin, if it did not destroy it.

"I have on two occasions had a slight taste of the white grub, which is often very destructive. Also I have had leaf blight appear in my strawberry patch, though it did not gain any considerable headway and ultimately the damage was slight. I used the same remedies with success that I have seen used by other berry growers with almost no effect. The reason these methods proved successful in my patch according to my belief is the perfect condition of the plants. It is my effort to keep each berry plant in my patch as vigorous and in as perfect condition as if the profits of my farm were dependent on it alone. In plant life as in animal life if you want to fend off disease you must keep up the individual vitality.—New York "Sun."

Spraying Demonstrations in Apple Orchards.

The Nebraska Agricultural Experiment Station has just issued Bulletin No. 98, entitled "Spraying Demonstrations in Nebraska Apple Orchards." The bulletin gives the results secured from the spraying demonstrations carried on last year in six counties of southeastern Nebraska by the Nebraska experiment Station and the U. S. Department of Agriculture. The cost of spraying and the value of sprayed and unsprayed fruit are reported in detail. The bulletin may be had free of cost by residents of Nebraska. Those who desire it should address the Agricultural Experiment Station, Lincoln, Nebraska.

BE PREPARED FOR THE HARVEST WITH THE RIGHT MACHINE

YOU cannot afford to run any risk of delay at harvest time. Every minute counts when the grain is ripe for cutting. Every minute of smooth, rapid, uninterrupted work will pile up your profits. Every minute of delay due to a slow, inefficient bungling or broken-down machine will rob you of a part of your just reward. Let the harvest find you prepared. Start today to look over your equipment. Face the question squarely.

Is it going to permit you to get all the profits from your acres. If it is not—now is the time to choose the machine that will. Because you are going to be busier every day from now on.

We want you to take proper time to make your selection because we know if you do you'll want a Deering. It's one of the best machines for your use. It's built to meet the conditions encountered on Canadian farms.

It will get all your grain no matter if it is tangled or down in the shortest possible time. It has strength, a wide range of adjustment for all conditions of grain and ground surface, and the draft is as light as it is possible to secure in a perfect working binder.

It is a proved machine. It has been in use for more than a generation, and its superior has never been produced. You cannot make a mistake in purchasing one. The Deering line comprises—

Harvesting Machines, Binder Twine, Mowers, Tedders, Hay Rakes and Side Delivery Rakes, Hay Loaders, Disk, Shoe and Hoe Drills, Cultivators, Seeders, Smoothing, Spring Tooth and Disk Harrows, Land Rollers, Scufflers. Deering agents also handle Gasoline Engines, Cream Separators, Hay Presses, Wagons, Sleighs and Manure Spreaders.

Call on the local agent for catalogue and particulars on any Deering machine or implement, or write the International Harvester Company of America at the nearest branch house named below:

INVENTIONS Thoroughly protected by patent in all countries. EGERTON R. CASE, Registered U. S. Patent Attorney. TEMPLE BUILDING TORONTO. Booklet on patents and drawing sheet on request.

In 1906 spraying demonstrations were conducted in six apple orchards, one in each of six counties of southeastern Nebraska Agricultural Experimental Station, the United States Department of Agriculture, and the owners of the orchards. The objects were to demonstrate the value of spraying in controlling apple scab and codling-moth, to determine the cost of spraying, and to learn whether it pays to spray apples under the conditions existing in Nebraska.

In each of the orchards a part of the trees were sprayed and a part left unsprayed for comparison. One of the orchards was sprayed four times and the other five times. The spray material was Bordeaux mixture containing some poison, Paris green, arsenate of lead, etc.

An accurate account was kept of the quantity and the cost of the spraying materials used and of the time and cost of applying the spray. Extensive observations were made as to the percentages of wormy and scabby fruits on sprayed and unsprayed trees. An exact record was made of the yield of fruit of a part of the trees of the sprayed and of the unsprayed blocks of each orchard. The selling price of the fruit was also determined as nearly as possible in every case.

The total quantity of material used per tree for the five sprayings varied from 5 to 15 gallons, averaging nearly 11 gallons, or a little over two gallons per tree for each application. The material cost from a trifle less than one cent to nearly one and a half cents per galllon, averaging one cent per gallon. The cost of applying the spray was from six-tenths of a cent per gallon where power sprayers were used, and about one and a half cents per gallon where hand spray pumps were used, averaging a trifle over a cent a gallon. The total cost of both material and labor for spraying 2,175 trees five times was only a little over 21 cents per tree, the trees averaging about eighteen years old. The cost varied from 12 cents to 33 cents per tree, depending upon the age of the tree, the conveniencies for mixing materials the kinds of pumps used, and the like. The average cost was a little over four cents per tree for each spraying.

Records made at the end of the season from the entire crops of 37 sprayed trees and 39 unsprayed ones in the different orchards, including observations on over 110,000 fruits, showed 22 per cent. of wormy apples on sprayed trees and 46 per cent on unsprayed ones. Of the sprayed fruits 6 per cent and of the unspraped fruits 38 per cent were scabby.

During the fall the foliage of the sprayed trees was much healthier than that of the unsprayed ones. In many cases, from 50 per cent to 75 per cent of the foliage of the unsprayed trees was on the ground early in October and in some instances the trees were almost defoliated at that time. Moreover, the leaves that remained on the unsprayed tress were entirely killed by the frosts of early October. At the same time the leaves of the sprayed trees were bright green, comparatively free from fungus diseases, and almost perfectly free from frost injury, and very few had fallen to the ground.

The entire crop of fruit from 205 sprayed trees and 71 unsprayed ones in the different orchards was gathered and classified into "merchantable fruit," "culls" and "windfalls." The merchantable fruit was such as the owners were able to market in the ordinary ways, and the culls and windfalls were such as were fit only for vinegar factories and the like. The average yield of the sprayed trees was 8.4 bushels per tree, and of the unsprayed trees 6.6 bushels per tree. The smaller yield of the unsprayed trees was due in part to the smaller size of the individual fruits and in part probably to the dropping of many fruits early in the season. The culls amounted to 8 per cent. of the total crop of sprayed fruit and to 23 per cent. in case of the unsprayed fruit. The windfalls, likewise, were 17 per cent. and 34 per cent. for sprayed and unsprayed fruit, respectively. The total value for the unsprayed fruit averaged 80 cents per tree, while for the sprayed trees the average value was $1.87. Subtracting from the latter the average cost of spraying, 21 cents per tree, there remains a net value of $1.66 per tree for the sprayed fruit, against 80 cents per tree for the unsprayed fruit, or a direct gain from spraying of 86 cents per tree. On land worth $100 per acre, the unsprayed fruit produced an average return of about $40 per acre above the cost of harvesting, and the sprayed fruit on the same land gave an average return of over $80 per acre above the cost of harvesting and of spraying. If it pays to grow apples at all, it pays to spray them !

The bulletin gives the following recommendations for spraying this year, based upon the results obtained last year :

(1) Spray with Bordeaux mixture after the cluster buds open, but before the individual flower buds open.

(2) Spray with Bordeaux and some poison, such as arsenate of lead, Paris green, etc., as soon as possible after the blossoms fall, and at any rate before the calyx lobes of the apple close.

(3) Spray with Bordeaux and poison three or four weeks after the flowers fall.

(4) Spray with arsenate of lead about July 20th.

(5) Spray with arsenate of lead about August 10th.

Use Paris green at the rate of one-fourth to one-third pound per barrel of Bordeaux. Use arsenate of lead at the rate of two pounds per barrel of Bordeaux or water.

Make Bordeaux as follows :

Bluestone	4 pounds
Quicklime	6 pounds
Water	50 gallons

Slake the lime, dissolve the bluestone, dilute each with half the required quantity of water, and mix thoroughly.

Use good nozzles and maintain a high pressure as uniformly as possible in order to distribute the liquid in a mist-like spray. Take care to reach all parts of the trees and to avoid drenching any part. Careless spraying should not be tolerated.—R. A. EMERSON, Nebraska Experiment Station.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Bonusing the Dairy Cow.

Editor Maritime Farmer:—

I was pleased to see a correspondent's further comment on the bonus question for dairy cattle.

I refer to the letter from my friend Mr. Peters, in your last issue.

I am going to ask you for space in this issue, for fear any of your readers should notice the amount of money which my friend Mr. Peters, seems to be under the impression I stated would be required as its first item, namely, three hundred thousand dollars.

This amount would perhaps be a paralizer. What I did say was that it would require, under the estimate I made up, from $30,000 to $40,000 to try it for one year.

This estimate was made up as follows: In order to give each county a chance simultaneously, would require fifteen Inspectors, one for each county. ...

These I estimated at $1000 each $15000.00

I further estimated that these fifteen could inspect or check up in the neighborhood of 500 cows for two milkings once each month (this would vary according to the distances apart the herds entering would be). This would make 7500 cattle available to compete for Bonus and in order to be prepared that all would succeed in making 4000 lbs. milk and 160 lbs Butter Fat and the Bonus says 300 per cow would leave the Dept. open to have to furnish.....$22500.00

Or a total of..... $37500.00

To which might be added some incidental expenses say 2500.00

Or a grand total of $40000.00

It is not, however, to be expected that all, those entering will be successful and make the required amount, but of course the Department would have to be prepared Then your readers will understand the amount required to qualify is to be raised each year 1000 lbs., that is, if the scheme proved workable and productive of good results it would be carried on for five years, making 5000 lbs. the minimum the 2nd year, 6000 the 3rd year, 7000 the 4th year, and 8000 the 5th year.

My own opinion is, the amount to be paid bonus each year would rapidly grow less as the amount required to qualify increased, so that the Bonus money would not necessarily grow excessively burdensome and yet the result required would be attained, namely ascertaining the productive value of your cow machine.

Now it is quite true that this weighing should be done without this incentive but the fact remains that it is not done in one case in ten, and yet the Department and Institute speakers have been preaching it for years and years, and instead they are leaving the dairy and going at the wheat and I am strongly of the opinion that nothing short of the Bonus dollar will wake the majority up to the fact that they must know what the machine is doing if they are to continue putting the costly feed of today into that machine.

I am quite willing to admit that it is some trouble and expense to weigh, especially at 5 a. m. fo a winter's morning, with a half blackened lantern globe as the only light and one's own eyes about half opened and perhaps in the spring of the year you have been up half the night looking after a new calf—or staying by the ewe with her new lamb, etc., and yet to accomplish the desired result today you must introduce and keep up some business methods in order to keep in the competition at all, as one cannot farm today and meet competition under the same system as our forefathers or our old veteran friend, Donald Innis, did.

Because where Donald, 30 years ago could get along with a scythe @ 60c, we must have a mower @ $60.00, and where he had a hand rake at 25c, we must have a horse rake at $25.00, and so on, or if we don't its the Sheriff that would be knocking at the door instead of Donald's Woodpecker.

I myself started out to make a living from the dairy cow, some 27 or 28 years ago, but like a good many

"Acadia" Lime-Sulphur Solution

more I got discouraged, because having a very limited capital I did not seem to get ahead and finally drifted away from it and found it easier to make a profit in other lines. I thought at that time the trouble was with the country itself, after seeing other countries I found out there was nothing much wrong with this country and after some more years of investigation I am satisfied the dairyman's greatest trouble is in the lack of knowledge of his production, and the fact that he is only producing with two machines about as much as he should produce with one. This can only be verified by careful weighing and testing year after year—breeding only those which are producing paying quantities and weeding out those which are not.

Think what this expenditure of $40,000 would do. It would produce a definite knowledge of what 7,500 animals, at least were doing.

It would encourage at least 700 or 800 dairymen each year to a larger and heavier production with practically no more cost. If the money were spent, it would all be spent within the country and return to every business interest in the country. It would enable the wholesale distributor of the product to reach out and get a foreign connection to export to, inasmuch as he would feel safe that the production was going to keep up at least for 5 years, and right here is one of the dairyman's hardest set backs, for after all this is only a very narrow and limited market here in New Brunswick, because our buyers after all can only handle a very limited volumn of trade and while it is true that they have to go outside today for some dairy and hog products and consequently pay a high price, yet when we all get to producing on those lines it does not take long for our limited market to get overstocked and the price to tumble down, along with which tumble comes the discouragement to the producer.

One cannot perhaps blame the wholesaler, for in the past if he should attempt to start for an export connection the very next season he is confronted with a shortage and he is unable to make sales.

If on the other hand, he was assured of a continuous increase so he could make his foreign connection, or export trade. He ought then in his own interests to keep up a fair market price, knowing that he would be able to sell and increase.

It is in this direction that we are different from our neighbors in the Upper Provinces inasmuch as they have a much larger more expansive market and buyers than we in this smaller market.

I myself, have seen pork, for instance, which is part and parcel of the dairying, in the St. John market start, say, at 9c in the fall and before the River navigation close go down to 5c, simply because the buyers quickly got all they could handle, or apparently so.

So far as the need of this Bonus or encouragement is concerned, I think all will agree, especially when you stop to see the way our ranks are being depleted and the farms abandoned of stock raising and the rush to the wheat fields. In many parts of this, the Banner County of Kings, so called, it is going on to an alarming extent, and mind you the Dominion Government is practically bonusing them to go by giving them 160 acres of workable land that with willing hands and a pair of horses will produce a profitable crop in one year's time.

Do your readers and our representatives in the Government know and realize that our dairy production through the creameries has decreased over 2,000,000 lbs. of butter from what it was two years ago.

Think of what that means?

Some day you'll own an Empire Separator

No matter what make of separator you may own at present—no matter what make you may buy this year—sooner or later you'll get an Empire. The sooner that day arrives the quicker you'll know what a really good separator will do. Judge the Empire from what it has done for others. It will do the same for you.

Empire Cream Separator Co., Sussex, N. B.
Gentlemen:—I have used an Empire Cream Separator for over three years without it costing me a cent for repairs in that time. It runs so easily my little boy six years old thinks it great fun to be allowed to turn it. It is a close skimmer, easily washed, and a marvel of simplicity.
Annapolis Royal. (Signed) H. Dwight Ruggles.

Empire Cream Separator Co., Toronto, Ont.
Gentlemen:—Ten years ago I bought a No. 5 Empire separator in Montreal from your agent in that place and have used it ever since. The cost during the ten years for repairs, aside from an occasional rubber ring, was 25c for a new point in the end of the spindle.
Hemingford, Que. (Signed) Archie Cleland.

Empire Cream Separator Co., Toronto, Ont.
Gentlemen:—Eight years ago last spring I purchased one of your No. 5 Empire Cream Separators and during those eight years we have run it continuously without spending a cent for repairs, aside from a few rubber rings. We are using the separator today, and it does as good work as ever.
Rougemount. (Signed) James Standish.

Empire Cream Separator Co., Toronto, Ont.
Gentlemen:—The 325 pound per hour separator I got from you nine years ago has given perfect satisfaction. I have kept 15 cows on an average. It has not cost me one cent for repairs in that time, and is in good running order today.
Rocklyn, Ont. (Signed) Samuel Gilmour.

Empire Cream Separator Co., Toronto, Ont.
Gentlemen:—After a thorough test of the Empire Separator, I found it to be a first class machine, working well under all conditions. Will make the best job of milk when it is cold of any machine I have seen. • • •
Cobourg, Ont. (Signed) J. F. McMillan,
Supt. House of Refuge.

Empire Cream Separator Co., Toronto, Ont.
Gentlemen:—Having purchased one of your separators over seven years ago, I have much pleasure in recommending it. Have used the separator continually during the seven years, and it has not cost me one cent for repairs.
Whalen, Ont. (Signed) Mark McGee,

There is an Empire dealer in almost every town in Canada. If there isn't one in your town write us direct for special offer.

Put the Joke on Him

If any one tells you that disks are ne essary in a mo.ern cream separator, put the joke on him. Ask him why traction engines and automobiles need no horses. He'll say, "Because they have got power enough without horses."

Then tell him that Sharples Dairy Tubular Cream Separators need no disks because they produce skimming force enough without them—that Dairy Tubulars have no "fillings" yet produce twice the skimming force, skim faster, skim several times cleaner and last longer than common machines.

Full pan shows disks from common separator. Other pan shows the only piece used inside Sharples Dairy Tubular Bowls.

Tubular sales easily exceed most, if not all, others combined. Tubulars probably replace more common separators than any one maker of such machines sells. The manufacture of Tubulars is one of Canada's leading industries. The World's Best.

T. W. Boyd & Son,
27 Notre Dame St. West, Montreal

Some of it may perhaps be accounted for by being made at home on the farm, but still it ought to be increasing both on the farm and in the creamery.

Twenty years ago Denmark was exporting $7,000,000 worth of butter, while last year she exported $45,000,000.

Incidentally I might mention that the same increase is visible in all her farm products, brought about principally from the fact that she maintains almost a thorough agricultural policy, and there are at the present time some 24 members of its government who are practical farmers, who know what they want and who assist the agriculturist in every possible way.

The possibilities of this dairy industry in the Province of New Brunswick are enormous, if it is once put on a profit producing basis. We can raise crops here equal to any part of Canada, unless it may be one or two grain crops. What we need is to get our own people on their feet.

The time is coming when the West will look to the East for dairy cattle, in fact I have the proof of this on my table before me now in an enquiry for a carload of Ayrshires for Wyoming (this comes in response to my ad in your excellent paper, and reaches me only about one week after the paper was issued). They go on to state that they shall have to look to the East for dairy stock. This will no doubt be much truer as time goes on, for with so many cutting out the live stock and going into the wheat raising, it will not be long before their soil will become depleted and the wheat market eventually overstocked, because in cutting off the live stock they are cutting down one of their heaviest customers for grain and grain products and will surely eventually drive their own market price down. Already I read of a large percentage of last year's grain being held by the farmers themselves. Let us then get some stimulation from this bonus. Get our herds in better shape and be ready for stocking up our old neighbors when they come East for some good milkers, by that time we will have records to show them of just what profit producers we have.

I already have many converts to this idea and will be glad to hear through your columns of many more and if we stand shoulder to shoulder it will surely come, for after all our representatives are only elected to carry out our wishes, and it is surely the farmers turn for something now. He has been patted on the back long enough—told he is the backbone of the country—made to pay his share of the taxes which in the end, pays the subsidy for new railways. Pays the subsidy for new steamship lines. Guarantees the interest on cold storage warehouses for the capitalist. Pays the bonus on the steel making. Pays the bonus on the iron production. Pays the bounty to the fisherman and other items too numerous to mention.

Now let us have a turn and have a bonus on the dairy cow production.

I am no politician and do not know the ways and means required to raise the amount but I say if it can be done for every other industry the way can be found to do it for this, when in the words of Chancellor Jones, of the U. N. B. say:

Fish in N. B. is worth.....$6,000,000
Lumber in N. B. is worth 7,000,000
Agriculture is worth..... 20,000,000

Add to this the fact that our specially appointed commission honestly report a decline in almost every branch of the business, in every section they visited and I think you have all the good necessary to demand a radical change of some sort.

In order that all your readers may have an intelligent idea of the

Steady as a Rock.

The Square Gear

MAGNET CREAM SEPARATOR

Skims perfectly setting on the ground or floor

The double supported bowl cannot wobble.

At our expense you can study MAGNGT construction in your own Dairy.

You will find its frame strong and rigid.

It is run by square gears and you know that all good machines are built that way.

Its steel bowl is supported at both ends (MAGNET Patent.)

All other separator bowls have only one end steadied.

The skimmer in one piece, (easily cleaned) takes out all the butter fat and also separates the slime and foreign matter.

The MAGNET Cream Separator delivers good thick cream every day.

The MAGNET Brake circles the bowl, stops it in eight seconds, preventing wear and saves time.

The MAGNET owner can increase the capacity when he gets more cows for a few dollars, by changing bowls and skimmer only.

No matter what cream separator a man experiments with or buys, he will finally settle down to the MAGNET and when he does his separator troubles are at an end.

Why not buy a MAGNET at first and avoid trouble?

The MAGNET is fifty years away from the scrap heap.

proposed bonus I submit details as follows:

That a sum not exceeding $15,000. be granted for the remuneration of fifteen inspectors, one for each county, whose duty it shall be to visit each herd that may enter for the bonus, once each month during the year, there to inspect the weighing of each cows milk that is entered in the test, both night and morning. Also to test the milk for butter fat. That said inspector shall be a capable practical man, expert enough to give instruction and advice regarding breeding, feeds, and feeding when called upon to do so.

He shall also be required to take an accurate census while passing through the county of the live stock, crops and any other statistics that may be required. That a further sum, not exceeding $25,000, be granted for the purpose of paying a bonus of $3.00 per cow to all cows qualifying for the following production, each year.

1st year all making not less than 4000 lbs. milk or 160 lbs. butter fat.
2nd year all making not less than 5000 lbs. milk or 200 lbs. butter fat.
3rd year all making not less than 6000 lbs. milk or 240 lbs. butter fat.
4th year all making not less than 7000 lbs. milk or 280 lbs. butter fat.
5th year all making not less than 80000 lbs. milk or 320 lbs butter fat.

That this plan be put into effect for one year first as a trial and if found unproductive of good results, that it be continued for four years longer, or five years in all.

This in brief is the scheme as outlined. The amount required is a mere bagatelle if it will put the industry on its feet for there are over 6000 people directly and indirectly interested in this line in the Province of N. B., and I believe I am within the mark in stating that at least 75 per cent. are discouraged today and I further believe it is because they do not realize that they are feeding two to get the same result they should get from one.

At the end of five years, those entering for bonus would know just where they stood, would know just what their machines were earning and whether they could afford to keep them or not. The machines that were producing would have some value.

At present the average cow changes hands at about $30 to $35, the buyer has nothing to go by except his judgment, and that is often like telling a horse's age after the marks has gone off his teeth.

He will invariably be told "she will fill a pail" but he forgets the long time she goes without filling a pail.

Prof. Cummings says the average production in the Maritime Provinces is 3000 lbs., that would make on an average 120 lbs. of butter fat worth an average of $30 for a year, while she will cost in feed alone that much money.

Is it any wonder that the majority are discouraged.

Can anyone afford to sell any kind of a dairy cow for $30.00.

Supposing she drops her first calf and begins to produce at 2½ years old. He would have to feed and care for her for at least 2 winters of 8 months each or 16 months in all, that would be 480 days and if it was only worth 5 cents per day including feed she would cost $28.00 before she began to produce, and it ought to be worth that much to tend her twice a day to say nothing of feed.

Before closing I also want to remark regarding the letter in your last issue re Help and Scotchman.

I do not believe it is half as hard to get help on the farm, as it is to pay them from profit off the farm, when you do get them. I also believe many of our own Province men are fully as good help as the imported, though it is true they ask more wages than an immigrant who is landed here with only enough money left to get to his destination, and if our farmers here only had as much profit from their dairy herds as the wheat producers in the West have from their wheat they also could afford to pay them those wages and then our own boys would be staying with us.

I have been an employer of labor for 18 years and I still have with me the first man I hired and every one in my employ today is a Blue Nose and most of them born and brought up in New Brunswick.

Now, Mr. Editor, I realize I am taking up a lot of valuable space, and I will merely say in closing, in case anyone should think me a pessimist, that every dollar I own (and it is true that is not many) is invested in the Maritime Provinces, some of them in dairy stock and some in a butter factory. This is my home, and I doubt not, always will be, and therefore, believing as I do that agriculture is truly our largest natural asset, I say, "let it be developed."

Let us hear from all, both for and against, because if the idea is right, it needs all your support, if the idea is wrong, point out its weak points.

Yours truly,
E. A. SCHOFIELD.

P. S.—I might add that I fully believe the Dominion Government might well assist our own local government in some such scheme as this bonus, because I have read in the estimate passed at Ottawa this year of $165,000 passed for experimental farms. How much does N. B. get of that?

$100,000 passed for the development of dairy and fruit industry. Can we not come in for part?

Many Cases of White Plague Conquered by Butter Fat

Man for many centuries has been looking for something that will cure tuberculosis, but it is only recently that science has been able to insert an entering wedge into the mysteries which surround this disease. Fresh air and proper dieting are among the chief factors of treatment of patients affected with tuberculosis, and milk is considered one of the best foods for persons suffering from this malady. The following statements have been made by Dr. B. J. Kendall, Galena, Ill:—

The most certain method ever adopted for the cure of the "Great White Plague" is through the diet used as per directions given below which can be taken at home and comes within the reach of the poor as well as the rich.

The modus operandi is to force the body to take on fat, a desideratum long felt by the medical profession, but never before attained to.

KIDNEY TROUBLES

Are Overcome By

Dr. Morse's Indian Root Pills

The kidneys have a very important work to perform in preserving health. All the blood passes through them over and over again and they filter it, removing all the impurities and worn-out muscle and tissue which the blood gathers up, in microscopic particles, in its flow through the body. These impurities are then expelled through the urinary system.

When the kidneys for any reason fail to perform this function, and the impurities are left in the blood, *about the most distressing series of ailments which afflict mankind follow.* First there is the aching back and a feeling of weariness, and then, as conditions grow worse, comes Rheumatism, Gravel, Diabetes, Gall Stones, Inflammation of the Bladder or the dreaded Bright's Disease.

The man or woman who allows kidney trouble to develop into any of these diseases is doing himself or herself a grave injustice, particularly when a cure can be had so readily. One of the coustituents of **Dr. Morse's Indian Root Pills is** a Diuretic, which strengthens and stimulates the kidneys, enabling them to do their work thoroughly and with ease. These Pills also increase the action of the bowels and the pores of the skin, which remove some of the impurities, thus lightening the work of the kidneys.

Mr. Geo. Whitney, of Buffalo, N.Y., says they worked wonders for him. He writes:

"Your Doctor Morse's Indian Root Pills have worked wonders in my case. I suffered for six years from liver trouble and kidney ailment. If I tried one medicine I tried a dozen, but without good results. Your pills were recommended and they cured me after using four boxes."

Dr. Morse's Indian Root Pills should be taken at the first sign of back-ache, of rheumatism, or of any difficulty in urinating.

FENCE For SALE

4,000 Rods **4-bar 40 inch No. 9 Fence,** stays 22 inches apart In lots to suit, in 40 rod rolls. **Price 23c per rod.** Freight paid east of Fort William. This fence was made up for a foreign customer, who failed just before shipment was made.

Also some bargains in small lots of 7-Bar, 8-Bar and 10-Bar Fences. Particulars on request.

The EMPIRE FENCE EXPORT CO., LTD., Walkerville, Ont.
Good Dealers desired in unoccupied Canadian Territory.

During the last fifteen years I have prescribed this diet in hundreds of instances and where directions have been followed strictly it has raised the weight and increased the strength and vitality of the patient rapidly up to a normal condition, thus enabling nature to assert her sovereign right to be the dominating force in the body and the germs causing consumption have been overcome and the cure accomplished. Some have gained a pound a day and would gradually take on less until they would not increase in weight more.

The all important thing is to drink large quantities of milk strippings (the very last of the milking, which is all cream when a proper cow is selected.) This seems so simple and easy that many have refuseh to follow directions and demand medicine to cure them; but there has not yet been discovered any medicine that is a specific for consumption.

To get best results a healthy cow should be selected, one that does not cough and one that gives very rich milk. The milk should always be tested to be sure that there is a large per cent of fat in it.

The last quart should be milked into a separate dish which rests in a larger vessel containing warm water just sufficient to prevent the strippings from cooling below blood heat. The cow should be thoroughly cleaned to prevent any dirt getting into the milk so the patient can blow back the froth and drink at once without straining as this cools it too much.

Begin by drinking nearly a pint in the morning and the same at night and increase the quantity gradually so that in ten or fifteen days a full quart will be taken twice a day. It should be taken immediately after milking, before it has had time to cool any. All should be taken that can be without too much discomfort and then rest two or three minutes and drink more and rest again and so on until a full quart has been taken as soon as it can be conveniently. In about fifteen minutes the patient should eat at the table such articles of food as are known to agree with the stomach. At noon eat as usual.

When the strippings are not allowed to cool below blood heat and taken immediately after it is milked, a full quart will be transfused into the circulation in a remarkably short time.

I never have seen a case but could take the strippings without any discomfort worth mentioning when above directions were followed strictly, although some have declared they could not before trying it; but when they delayed taking for half an hour and the milk had cooled ten degrees I have seen half a pint make them very sick. The great secret of success with it is in taking it immediately after milking and not allowing it to cool below blood heat, taking a full quart morning and evening and having milk that is very rich.

The following is a typical case: Mrs. A. E. was suddenly startled to find her weight was forty pounds below normal. She was coughing terribly and soon had a very profuse hemorrhage from the lungs that came near taking her life. I at once began the use of the milk strippings after hemorrhage was stopped and in a few days, about ten or fifteen, she had gained nearly a pound a day and was soon able to get out of bed and go around the house. She gained quite rapidly and as her weight and strength increased her cough decreased. When she had gained thirty pounds in about three months her cough left her. I had her continue the same diet for six or eight weeks longer and she gained ten pounds more and then would not take on more flesh. She was then as well as she ever had been and continued well after the strippings were discontinued.

She took no medicine after the hemorrhage was stopped, excepting a little pepsin and some other digestive to aid digestion, and a simple cough remedy to ease the cough; but tar, lobelia, opium, tartar emetic and such medicines as disturb the stomach and interfere with digestion were carefully avoided.

It is easy for those on a farm to carry out this method, and on several occasions parties who lived in the city purchased a suitable cow and after complete recovery, in every instance, thay sold the cow for nearly as much as was paid for her.

I do not remember any case that followed the directions strictly that was not cured, but several persisted in declaring that they could not take it until so much valuable time was wasted that they lost their lives by it.

I have found the same diet, when above directions were carried out carefully, equally successful in increasing the weight and strength of those run down and debilitated from other causes.

No less a medical authority than Dr. Osler says: "The cure of tuberculosis is a question of nutrition; make a patient grow fat and the local disease may be left to take care of itself." Many others who have occupied the highest position in the medical profession have said the same; but none have pointed out a successful way of accomplishing it.—Hoard's Dairyman.

LET THE EXPERIENCE OF THE MAJORITY OF FARMERS BE YOUR GUIDE IN BUYING TWINE

THE time has come to order your binder twine for the 1910 harvest. Twine dealers are placing orders for their season's stock. The mills are running. Now is the time for you to decide the twine question. It is something that requires careful consideration. The success of your harvest will depend on the uninterrupted work of your binder, for no binder can work well if you use a cheap grade of binder twine.

It is our aim to have every farmer who uses I H C twine go through the 1910 harvest season without a break in the field. We have much more at stake than merely selling twine. Your interests and ours are the same.

We know that the raw materials from which I H C twines are spun have the quantity and quality of fibre that insure greater strength than is found in any other twine. They are evenly spun—smooth running—do not tangle in the twine box—work well in the knotter, insuring perfect binding and perfect tying. They insure your being able to work your binder through the entire harvest season with greatest speed and economy and are therefore practical profit insurance.

Those who buy cheap twine will certainly have trouble—delays due to tangles, knots and breaks will mean the loss of valuable time—and every delay at harvest time will cut down your profits.

There is a sure way to avoid this. Let the experience of the past be your guide in purchasing your twine. The verdict of the majority of the farmers of this country is a safe guide. Their decision should have more weight with you than the statement of any twine manufacturer. These farmers know. They have the same problems confronting them that you have. They have no axe to grind. They do not sell twine. They are only interested in results.

I H C Brand of Sisal—Standard Sisal Manila or Pure Manila

Are the twines used by the majority of the farmers of this country. They have been proved to give the best results. Eighty-five to 90 per cent of the farmers use Sisal. It is smooth running and works at steady tension without kinking or tangling in the twine box—insuring perfect binding and perfect tying. Its only equal is the really high grade Manila twines such as bear the I H C trade-mark.

Your interests and ours are identical on this twine proposition. We have more at stake than selling twine. We are vitally interested in the successful operation of hundreds of thousands of binders. On their successful operation depends our success—and we know they cannot operate successfully with poor twine. No binder made can. For this reason we have given the twine problem careful study. When we say "Stick to Sisal or high grade Manila bearing the I H C trade-mark"—we do so because we know them to be the highest standard of excellence in binder twine.

But we don't ask you to do as we say. We want you to be the judge. But your judgment to be right should be based on facts—not on the statement of any twine man. And the fact is—that the majority of the farmers of this country use I H C twine. Sisal or Standard (which is made from pure Sisal) comes 500 feet to the pound; high grade Manila, 600 feet to the pound; Pure Manila, 650 feet. See your local I H C dealer at once and let him know how much you will need. If you want more facts on binder twine, write the International Harvester Company of America at nearest branch house for information.

91&93 Market Square, St. John N. B

THE HORSE.

Value of the Brood Mare.

When selecting mares for breeding purposes it is all important to pick out the very best individuals that can be had. While it is not necessary to always have registered mares as brood mares, unless you are going to breed pure bred stock, and thus must have their pedigrees as well as certificates of registration before you can sell them as such, yet it is the mistake of a breeder's life if he uses undersize, malformed, awkward, and, worse still, unsound mares as brood mares. Too much is expected from the sire, and too little from the dam, in horse breeding more than any other line of stock breeding. If the colt is a poor individual when it is first born, the stallion gets the blame; if a fine colt, the stallion gets the credit by nine-tenths of the farmers throughout the country. Now, as a matter of fact, history shows that all of our great men were sons of exceptionally bright women. Even if they had not the advantages of anything more than an ordinary education they were women of fine common sense and manners. Close observation will also show that the best individual horses in all of the different breeds, horses which have won many prizes in the show rings, and races on the track, have been colts of mares that were exceptionally good individuals in their respective breed and class. Therefore, no breeder can pay too much attention to the individual mare when he is contemplating using her in the stud. Soundness is the first thing to consider when examining this particular animal; never breed an animal which has even a tendency towards any constitutional unsoundness; if you do, the trouble will be shown in the get sooner or later, and continually, if you keep up the practice of breeding unsound animals. The following are some of the more common constitutional evils which render the mare unsound for breeding purposes, viz., weak eyes. Never breed to a blind animal. I know that it is sometimes done without bad results, but such cases are exceptions and not the rule. Bone spavin, bog spavin, ringbone and curbs are some of the constitutional defects which are very often seen in colts out of mares known to be so affected. A brood mare should have good action and style for her class. Size is an all-important factor, yet I do not believe in making a sacrifice of substance, quality, style or action for size alone. In the opinion of the writer the question of size depends largely upon the purpose for which the horse is intended. There is no worse mistake to be made than to try to overcome a lack of size in the colt by breeding a very small mare to an exceptionally large stallion or the reverse. This marked difference is too great to get good results. We speak of "mating" animals when we breed them, and in the true sense of the word "mates" should be as near the same conformation, size, etc., as you can get them. This practice carried out in a general way, at least, in breeding our domestic animals, especially in horse breeding, would give us a more uniform type of horse—animals with the very best action, conformation and style in the particular breed. This practice of having the mare and stallion as near as possible the same size, would also lesson the mare's chances for accidents at the time of foaling. Do not try to get medium size horses by breeding a 1,200-pound stallion to a 600-pound pony mare. If you want a 900-lb. pair of horses to drive to a double buggy, then breed a 1,000-pound stallion to a 900-pound mares. By these abrupt crosses, that is, breeding very large stallions to undersize mares, you get as a result large bodied horses with legs two small to stand the weight of the body when subjected to work, or you get the most awkward animal in the world—a small body with very large legs, a horse that will trot all day but not get out of your sight. In fact, the breeder can get just what he wants in size, conformation, action and speed if he will only use judgment in selecting his stallions, and mares to mate him.—J. G. Ferneyhough, in the Practical Farmer.

The Horses in Hot Weather.

I recently read a very valuable and interesting article concerning the treatment of work horses during the hot weather. A little extra care and attention during the next few months means no end of comfort to your team, and it means a much better team, not only during the time, but one vastly superior in the future, for horses with galled necks and shoulders are apt to recover slowly, if they do not become habitually balky, as the result of their trying to work when the least effort causes them great pain.

What I started to speak of was the protection of the horses' heads from the effects of the direct rays of the sun during the hottest hours of the day, especially when the air is filled with humidity, and it is so very difficult to get a breath of air. I have seen the strw bonnet tried, but it often annoys nervous horses more than it can possibly help them.

The remedy that I have tried and found the most effective is a sponge placed beneath the bridle between the ears. If it is a very hot day and you find your horses are suffering severely stop at a watering trough and bathe the tops of their heads quite thoroughly, then wet the sponge and place it as above, and note the result. You have a fresh team in an instant. Repeat the dose as long as the heat continues to oppress them, and you will have a fresh team all day, and when the day is over you never would know they had been exposed to the heat at all. It is a simple remedy, and if you try it once you will try it often when occasion requires.

I once had a driving horse that felt the heat terribly on oppressive days,so much so that I did not drive her when I could avoid when the sun was hot. Once, while on a long trip I was caught far from my destination in severe hot weather and tried the wet sponge treatment.The result was very gratifying to us both. She enjoyed the bath immensely and soon became so pleased with it that ever afterward when she would be very warm and could reach a watering trough she would duck her nose clear to her eyes, and often more than once.

A good horse will, I believe, drive more than double the distance with half the exertion on a hot day if the wet sponge treatment is applied, and there is no reason to think that it would not be equally acceptable to a horse at work, if he was affected by the heat.

But this is not all. If you are on a long hard drive, and the road is at all hilly, and you want a fresh horse at the end of the journey, walk the hills with your horse. You will not be half as likely to start him into a trot, before he has reached the top, if you are on foot, as you will be if he alone is walking; and, again, if you have lightened his load by walking, you have just so much better horse to start off on a brisk trot when the top of the hill is reached.

And, again, you will not be nearly so tired when you have completed

GOOD REPORTS

Home Mixed Stock Food a Success

A short time ago we published in this column a formula for preparing Stock Food at home from Barnes English Compound and fresh nutritious grains.

We have received so many words of praise for this formula that we are reprinting it for the benefit of those who may have chanced to miss it.

The advantage of making your stock food at home, using only the pure medicines and fresh grains, and avoiding harmful drugs and worthless fillers, is certainly of great importance to every farmer and stockman.

The formula is as follows: Mix three pounds of Linseed Meal and six pounds Cornmeal with one pound Barnes English Compound, it will make ten pounds purest and strongest stock food that can be made. S. G. Amsden, Windsor, Ont., will send one pound package postpaid on receipt of 50 cents, money order or stamps.

Strawberry Plants.

Vigorous plants! best varieties, $3.00 per m. Special prices on large orders.

Fleshing Horses for Market.

The University of Illinois recently issued a bulletin on the "Re,ative Efficiency of Different Rations for Fleshing Horses for Market."

The conclusions drawn from a long series of experiments in fattening horses are as follows:

1. A mixed grain ration of corn and oats, when fed with clover hay, is more efficient than a single grain ration of corn for producing large gains in an eighty-four day feeding period.

2. While a ration of corn, oats, and clover hay is more expensive with prices of feeds as stated, that one of corn and clover hay, the gains are such as to make its use more economical.

3. Clover hay when fed with a mixed grain ration of corn and oats is more efficient for producing gains than timothy hay. In this test clover hay produced 58 per cent more gains than timothy.

4. A ration of corn, oats and timothy is not satisfactory for producing finish in fleshing horses for market, but may be materially improved by the addition of oil meal.

5. Experiment No. 2 showed but little difference in the efficiency of a ration of corn and oats where the oats fed equalled only one-fourth the amount of corn and where the oats and corn were fed in equal quantities by weight, with clover hay as roughage in each ration.

6. A ration of one-fourth oats and three-fourths corn proved more economical than one of half oats and half corn.

7. A ration of corn and bran fed in proportions of one part bran to four parts corn by weight is superior to an all-corn ration for producing gains when fed in conjunction with clover hay.

8. This test seemed to indicate that there is danger of feeding too much bran for best results when clover hay furnishes the roughage part of the ration. The bran and clover combined produced a too laxative condition.

9. A ration with a nutritive ratio of 1:10 is too wide for best results in fleshing horses. In these tests the narrower the nutritive ratio the larger the gains. Best results were secured with a nutritive ratio of 1:8.

10. Exercise has a retarding effect upon the taking on of flesh. In this test the horses receiving no exercise made 24 per cent more gains than those having a daily walk of 2.8 miles.

11. While box stalls are safer than single stalls for stabling horses, they are also more expensive and do not offer merits not possessed by single stalls so far as they may influence the horse in taking on flesh. The horses stabled in single stalls made 16 pounds or 8 per cent more gains in 84 days than those in box stalls.

12. Thin horses of some market classes will not return as large a profit in feeding as those of other classes. The kind of horses it will pay best to feed depends partially upon the season of the year when marketed. All heavy horses will pay better than light horses, and good choice animals better than those of the lower grades.

Shoeing Horses.

The spring is on and soon the road and track horse will have his road and speed shoes on. A horseshoer cannot make a good hoof out of a bad one, but he can help a bad one, if he knows his business and you will let him, and he can keep a good foot good, if you do not overdrive and when heated let the horse get chilled. A bad chill in a horse generally settles into his feet and he is foundered; or, partially so without being noticed. The next morning after a hard drive or fast work on road or track, place your hand on each hoof in turn. If they, or anyone of them is warmer than normal do not, as you love your horse and hope for his future, give him but gentle exercise until such time as his feet recover their usual cool condition. Especially in training a colt or filly to trot or pace is the care essential. Don't speed him, or her, at all unless the feet are in their normal cool condition; speed only when the feet are feeling so good that the youngster will not care where or how hard he or she slaps them down.

Be careful about the youngsters first shoeing. Have the shoe made to fit the hoof. The inside of a youngster's feet are generally straighter than the outside. Nature makes them that way to prevent interfering. Keep them in that shape. On the bottom of the foot pare the walls down level with the sole and then, on your life, stop! Leave the sole alone, it will wear down soon enough and even with all the protection nature has given it, you may need to supplement it with pads, if your colt goes so fast, as to make you think he is running away. If you take our advice you won't speed your horse fast on his first set of shoes, especially round one of the turns on a track. Remember that your shoer does not yet know how the youngster, or oldster, for that matter, brings his foot to the ground, whether straight in the swing of the leg and flat on the shoe or whether the swing of the leg is on a curve and the fall of the foot strikes the ground level, or on one side harder than another.

We might copy a long treatise on this subject of the wearing of the shoe, but treatises are technical, complicated and confusing, so we will put what we mean in our own—our critics say, countrified—way. Drive the horse carefully for the first three or four weeks on his spring shoes—never speed him unless you know he is going clear and then only for short distances and straightaway. In three or four weeks of road work bring him back to the shoer, who will, of course, remove the shoes. Then carefully observe whether on any of them it is worn more on one side than the other. Almost invariably you will find that such is the case, and generally on his front feet the left shoe is worn more on the outside and on the right foot the opposite—unless the shoer is left handed when conditions may be reversed and going to the left, as is done on the tracks, the latter condition is probably the better one. However, the shoer, if he knows his business, will see what is wrong and he will carefully work until the horse wears his shoe level on both sides of every foot. Better not hurry the shoer in this. He may not be able to remedy the defect in the next shoeing, but wait for your fast work until he does. He can do it if you give him time, and your horse is not at his best until it is done.

We have probably written enough for this time, but will add: Let your colt go over his toes on the front feet easily the first time, as you don't want any forging. A new shoe ought as a rule, to be well rounded out on the bottom at the toe. This will make the horse pick up his feet quicker and higher, thus getting them out of way of the hind feet which are always following the front ones like trip hammers. But in this, go easy until the shoer gets the horse going clear. The writer of this has a filly that can trot on something like a kindergarten track at a wonderful clip, but often the click of a hind foot against a fore one is heard. Tne first thing that the shoer must do is to get her to avoid that click when she gets old enough to be driven. If the owner persists in making her go fast before that is done she will begin to "cross-fire" or "hitch" or something worse—see!

DON'T JUDGE A MANURE SPREADER BY *LOOKS*

BECAUSE different makes of spreaders look alike—don't think they are alike. There's just as much, or more, difference between two spreaders of different makes that look alike as there is between automobiles of different makes that also look alike.

It's the way the spreader is built that counts. The way the power is generated, the materials, the design and moving of the apron—the way the power is applied—such things are what you must be careful about in buying a spreader. The best thing is to be sure of the makers—that they are absolutely experienced and reliable.

The market has become flooded with spreaders of slip-shod quality—slapped together in a hurry—since the demand has grown so large, owing to the general recognition of the big money-making and time and labor-saving qualities of good manure spreaders.

The actual value in actual use of

I H C Spreaders

Cloverleaf **Corn King**

has been proved by hundreds of satisfied farmers. Years of experience and study and practical testing go to make our 1910 patterns the very best to be had anywhere. You'll find strength where it ought to be. The construction simple, yet sturdy, with the right power in the right place. The draft is light—there's little friction—the axles and roller bearings are sand, dust, mud and water-proof.

I H C spreaders are made in all sizes, from 30 to 70 bushel capacity, and there is a style for every section and condition. Choose to suit your special requirements from the only complete line. Large, heavy, rapid working spreaders for big operations—spreaders for orchards, vineyards—in fact for every purpose.

It will be of considerable advantage to you to call on our local agent for catalogues and full information, or write the International Harvester Company of America at nearest branch house for these today.

CANADIAN BRANCHES—Brandon, Calgary, Edmonton, Hamilton, London, Montreal, Ottawa, Regina, Saskatoon, St. John, Winnipeg, Yorkton.

Cloverleaf Manure Spreader in Actual Use. Covers all the Ground—All Plant Food Washed into Soil by First Shower.

INTERNATIONAL HARVESTER COMPANY OF AMERICA CHICAGO U S A
(Incorporated)

The best way to increase the appetite of a horse, if such a thing is necessary, is to change his diet frequently.

Prevention is the best cure for all ailments. See that the horses' collars fit perfectly and there will be no more sore shoulders.

See to it that your barbed wire fence is not loose here and there, for one of your best horses may be the one that will get his legs cut.

A colt or horse will live and develope on good hay alone, but he will thrive better upon a two-third ration of hay and the rest straw. A ration of oats given with these will be all the better.

LIVE STOCK.

Feeding the Pig.

The following notes on Feeding the Pig are gleaned from a circular compiled by Wm. Dietrich, Assistant Chief in Swine Husbandry, Urbania Agricultural Experiment Station, University of Illinois.

Water.—The quantity of water fed descends gradually from 12 pounds daily per hundred pounds live weight with pigs two months old, down to four pounds daily for pigs eight months old, and in prime condition for market. The total quantity of water fed seems to be of greater importance than the manner in which it is fed. The best results, however, have been obtained by feeding the bulk of the water after the rest of the feed has been eaten, using enough water to make it palatable. During the hottest weather, however, it seems to be necessary to add a little more water to the dry feed. By giving the pigs dry feed or a thick slop and then free access to water, they did not do as well as in cases where the above specified quantity of water was mixed with all the dry feeds in the form of a slop, The former method, however, produced better results in summer than in winter, but was also comparatively ineffective during the hot weather. This indicates that in winter the pig will not drink enough and that, during the hot weather of summer he will drink too much when he is given free access to water.

Exercise.—A fact that has recently been determined indicates that the influence of exercise upon the functional activities of a pig is an important factor. Hence the lack of exercise to the fall pig is a handicap because, during the winter, on account of cold weather, not so much exercise is usually taken as in the summer, except during very hot periods. For maximum and most economical production, it seems absolutely necessary for the young and growing pigs to have an abundance of exercise. Its chief value seems to be in the influence it exerts upon the respiratory and digestive functions. If pigs are changed from lots where they have had considerable exercise, to lots where they do not have so much, their feed must be correspondingly reduced. Hence they will also make smaller and usually more expensive gains. If the weather conditions are such, as for instance, when it is very cold, that the pig does not take the usual amount of exercise, the ration should also be reduced correspondingly. Other conditions of environment may also necessitate changes in rations.

Changes in Rations.—Changes like those above mentioned must necessarily be more or less abrupt. Otherwise experimental data show that, in general, when changes of more than a very minor nature are to be made in rations, they should be made gradually, both in the feeds used and in the total quantity of digestible nutrients contained therein. It takes time for a pig to become accustomed to changes, so that he will eat, digest and assimilate the new ration as well as the old one, hence the more gradually such changes are made the better will be the results produced.

Pasture.—The results from feeding on pasture indicate that pigs can utilize to better advantage the same quantities of nutrients, in addition to the grass, than were fed in the dry lot experiments. It is believed in grazing the pigs get the needed exercise which stimulates the functions of respiration, digestion and metabolism, thus enabling them to utilize larger quantities of feed to better advantage. That is, they will make larger and more economical gains from a given quantity of feed, grain and pasture combined, when they have exercise, than when they have no exercise.

Feeds.—There are two general classes of feeds, namely, concentrates and roughages. Concentrates are feeds that contain a comparatively large per cent. of digestible nutrients, and a comparatively small per cent. of undigestible material,- or in other words, are the feeds that are not bulky. Roughages or bulky feeds are the opposite of concentrates; those containing relatively large proportions of undigestible material. The pig is an animal primarily adapted to the use of concentrates.

If too much concentrated feed and especially protein, is eaten, the factor of waste is set up which makes feeding much more unprofitable. This is defined as follows:

When a pig is fed more than a certain quantity of nutrients and especially protein, he does not use the excess over and above this quantity as economically for producing gains in live weight as when fed the quantity below this point. The portion lost on account of less economical use is what is here termed the factor of waste. When the animal is once put under such conditions, this habit of wasting apparently is more or less permanently established.

Selection of Feeds.—Feeds should be selected primarily with the end in view of furnishing the proper quantity of digestible nutrigents in a palatable form as follows: Water, protein, carbohydrate, either extract, mineral matter and also bulk. Home grown feeds should be used where possible, but where these are not available commercial feeds may be substituted. While many of the commercial feeds are all right and as good perhaps as those that may be grown on the farm, the profit in general is greater from home feeds. Furthermore, the supply of commercial feeds is limited and available only to a comparatively small number of feeders.

A pig under five or six months of age apparently cannot assimilate as much as he can digest; consequently best results are obtained, if he is not fed more than he can finally use for the construction of body issue and for necessary energy and heat production. In order to limit the nutrients to the amount that the pig can most profitably use, roughages may be introduced into the ration at this time. These serve a double purpose: First, they satisfy the appetite of the pig, and second, they have a tendency to increase his capacity, so that later in life, when he otherwise would not eat as much as he could profitably use he will be able to consume a larger quantity of nutrients. Roughages may also be used in considerable quantities by pigs that are simply being maintained.

Starting at two months of age the pig should have 12 lbs. of water daily per hundred pounds of live weight. This is gradually reduced during the following six months or twenty-six weeks, to 4 pounds, with a reduction of 3 pounds of water for each week.

In order to supply the necessary mineral substances the results on the station farm seem to be quite satisfactory if the pig is given free access to salt, charcoal, air-slaked lime, bone meal, wood ashes, clean soil and soft coal cinders. These, with the exception of the last two, are kept in different compartments of a trough before the pigs at all times.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink Eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.

E. J. ANDERSON.

DEAR SIRS,— BEAR RIVER, N. S.

We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.

Yours truly,

CLARKE BROS.

E. S. Leonard Wins the Murray Cup.

The Agricultural College closed its winter session this afternoon. At the conclusion of the examinations, the cup, presented by the Hon. G. H. Murray, Premier of Nova Scotia, for the best judging of live stock by the students of the college, was awarded to E. S. Leonard, of Paradise, Annapolis Co., who received 87 out of a possible 100 marks for judging of horses, beef cattle, dairy cattle, sheep and swine. The runner up was W. L. McFarlane, of Fox Harbor, Cumberland Co. and close to him came W. B. Gornall, of England; John Chisholm, of Glen Road, Antigonish County; A. B. Baird, of Chipman, N. B.; and H. Ross, of River John, Pictou Co. The examinations were canducted by Dr. J. Standish and E. S. Archibald, of the staff of the Agricultural College.

Hon. Mr. Murray has always endorsed the policy of improving the live stock of the Province, and hence this cup for the best judging of live stock comes most fittingly from him. Altogether 42 students contested for this cup.

Tomorrow, a party of college students, under the charge of Prof. Smith, will go to Annapolis and Digby Counties to complete the work which has been in operation during the winter of exterminating the Brown Tail Moth. Only a few days remain before the caterpillars will leave their nests and spread over the trees, making it almost impossible to effect a destruction by cutting and burning the nests. The work of destroying these nests has been in operation since January last and has been more thoroughly done than in any previous year. Altogether, between 1200 and 1500 nests have been picked and destroyed, in comparison with 6000 four years ago, thus showing that great progress has been made in destroying this insect.

Dr. Hewitt, Dominion Entomologist who recently visited the Province recognizing the national importance of keeping this destructive moth out of Canada, purposes recommending that the Federal Department of Agriculture join with the Local Department in the work of eradicating the Brown Tail Moth, and from a general inspection of the area infested, is sanguine of at least keeping in control, if not absolutely destroying the moth. Citizens of Nova Scotia, who are familiar with the conditions in Massachusetts, and know that it costs over $1,000,000 per year to repress this pest in that single State, cannot but endorse the active policy which the Local Department have pursued. It is hoped that during the next few days owners of properties in Kings, Annapolis and Digby Counties at least, will make a very thorough search of their orchards, with a view to finding any possible nests which may be present. The matter is of great private and public importance.

Don't Forget To Dip The Pigs.

Our readers are busy now; more work every morning than can be accomplished through the day. Not the least imperative, however, is dipping the pigs once a month. Our readers may say: It is very easy for you to tell us to do this, but how are we to get the time?

Let us reason together just a little bit. Why are you growing these pigs? Is it not to make use of the by-products of the farm, the skim-milk, the buttermilk, the clover? Is it not, therefore, of the utmost importance that these pigs be kept healthy and that they grow as rapidly as possible? How can you expect them to grow if they are lousy or mangy or dirty; and how can you expect them to be free from lice and dirt unless you dip them?

If you have any considerable number of pigs and do not have a dipping tank, get one and then set a day, if necessary, but dip your pigs are to be dipped. If it is a bright hay-making day, and there is danger of rain, put it off till the next day, if necessary, but hip your pigs once a month. The time spent in dipping them will pay you more money than if spent in the clover field.

It is of the utmost importance when hogs are selling at ten cents a pound, to have them grow as fast as possible; and to do that they must be free from vermin, scurf and filth, and kept in the best possible condition. Once more we say: Dip your pigs.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Unruly Member.

By Marion Harland.

(Continued from last issue.)

Certain it was that no somber thoughts clouded the joyous mood in which she came flying to her aunt's room the next evening. Breathless with her rapid ascent of the stairs, she could not speak for a moment; nor was there need for words. Aunt Janet's pleasant remark interpreted the expression of her radiant countenance: "He is here, I see; and you would like to have me behold and be seen by my future nephew."

Cora nodded impatiently, and went on emptying her aunt's lap of the sewing it contained, upsetting the word-box by the operation.

"Never mind it,' observed Aunt Janet. There will be plenty of time by and by to pick up my spools and patchwork. You do not suspect me of any intention to enact Madame de Trop very long on this the evening of his arrival."

She was beguiled into a more protracted siting below than she had anticipated. Prepared as she was to approve her niece's choice, confirmed by her father's endorsement of its wisdom. Aunt Janet was agreeably surprised. There was a mingling of gentleness and dignity in Mr. Miller's manner, a union of heart and intellect in his conversation, which left no room for wonder that Cora should regard him as the embodiment of all that is to be loved and respected in man. The plighted pair were a contrast in behavior and temperament, but one that formed an interesting study. Cora's vivacity and piquant modes of expression never seemed more fascinating than when tempered, not repressed, by a certain deferential appeal in manner or tone to his stronger mind and superior judgement. Seen thus, she was the charming, winning woman; while in him the decided opinions of one perfectly conversant with his subject, independent in behalf and in its declaration, were so softened by his style of addressing her as to draw her on to a free revelation of her sentiments, rather than awe her into reserve. He could never be harsh with me, however deeply I might offend him," Cora had said, that day, to her aunt. Mrs. Barrett acknowledged, as she watched them together, that this was not a girlish boast of unfounded exultation—that while Horace Miller was not the man to look lightly upon any deviation from the path of rectitude, nor perhaps to submit tamely to personal affront, there was nevertheless in him a large-hearted charity and generosity which would overlook and forgive faults, even crimes, in one that he loved.

Cora rattled on merrily, to overcome her trifling embarrasment at the novelty of her position in her aunt's sight. "You are aware," she said to Mr. Miller, "that I lived with Aunt Janet all my life before I was grown. Until within a year or two back, I knew no other home than hers. Then she suddenly awoke to the fact that I was an incorrigibly troublesome article of household furniture, and bundled me back upon my poor. dear father's hands, as other merchants do unprofitable and damaged wares."

Aunt Janet's smile was painfully constrained. "Cannot she speak without exaggeration? Into what trouble may not this foolish, worse than foolish practice lead her?" was her mental comment, as she compared Cora's "facts" with the true statement of the case. The period of Mrs. Barrett's guardianship of her young relative was comprised between Cora's eight and thirteen years, and the "year or two back" signified the lustrum that had elapsed since Mrs. Manning's partial restoration to health, her daughter being now nineteen.

"Your friend, Miss Healy, did us the honor of spending the entire forenoon of yesterday here," said Cora, archly.

"I trust the favor was properly appreciated by the recipients," answered Mr. Miller, in a like strain. "She quite 'talked herself out' for once, I suppose."

"By no means, my good sir. That shows what injustice you are disposed to do her colloquial talents. Her lament at tearing herself away from us, as the dinner-bell rang—she having come before the breakfast things were removed, while the flavor of coffee and buckwheat-cakes 'lingered here still'—had the accustomed pathetic burden, 'not half talked out, my dear creature!

Her comical mimicry of the gosip was highly amusing to Mr. Miller, but Aunt Janet bethought herself of her resolution to retire early, and did not feel that its execution envolved any self-denial on her side.

"Poor child!" she sighed, as she laid her head upon the pillow. "Oh, that mothers would teach their children the worth of that pearl of great price—truth, pure and undefiled! Cora's are only idle words, it is true, but for every one of these we read that we 'shall be called into judgment."

Among Cora's visitors of the following day was Ellen Miller, Horace's sister. The girls' confabulations were always interesting, for the engagement was known to the Miller family, and Ellen was, moreover, the most intimate associate of Cora's at school and in society.

"I chanced to meet Miss Healy as I was making a call yesterday," she said, suspending the discussion of more important matters. "What an unscrupulous gossip she is!"

"What fresh evidence did she grant you of this prosperity?" asked Cora.

"Why. you will not believe it, but, in my presence and hearing, she brought forward the subject of your engagement to Horace, and flatly contradicted it as an absurd rumor, quoting you as her authority! You had, she declared, denied to her that there ever had been anything of the kind, and intimated that you had rejected Horace's proposal from the beginning; and, to wind up the farce, she represented how you had implored her to rectify popular impressions on his head!" Cora was dumb with dismayed surprise. "Did you ever hear a more shameless falsehood or a bolder stroke of impatience?" continued the indignant sister. "And to use your name to foist it off upon the community!"

"What did you say?" faltered Cora, whose changing color was to Ellen only the reflection of her own heat.

"Oh, she did not stop there! She referred to me for my opinion! I informed her, curtly, that she must not expect either corroboration or denial from me, since the alternatives were to cast discredit upon your word, or to betray my brother's confidence. If he were a discarded lover, you were the person most likely to be aware of your own act; if accepted, it was but natural that I, as his sister, should be appraised of the event. I can laugh now, when I think how she withered down as I concluded my speech with a frigid 'good-morning;' but I was not so sensibly cool in talking the affair over with Horace, last night."

"With Horace?" Cora's heart stood still.

"Yes. Is there anything so surprising in that? One would think, you little goose, that he was in danger of believing the ridiculous tale, from your terrified look! 'A likely story!' he said, when it was finished. Cora is the most truthful girl alive, and Miss Healy is the most—well, no matter what! A toad cannot harm a star, let it spit venom from night to morning.' There's a compliment for you, my little lady! Are you not obliged to Miss Healy for having served as the means of obtaining it?"

There was too much of the true woman about Cora for her not to feel a pang of compuction at the necessity of submitting to this unmerited, ill-bestowed praise. The consciousness that in accepting it she was wronging another, however deservedly unpopular that other might be, was a poignant reflection. She became abstracted and pensive, revolving in her mind her folly—she gave it no harsh title—and its present consequences, and determining to be more watchful of her tongue in future. Alas for the repentance which is based upon conviction so imperfect! for the reformation preceded by so partial a view of the nature and extent of transgression committed!

Ellen was speaking of Aunt Janet when her friend again listened. "I regret that Mrs. Barret should have selected this morning for her shopping expedition; I am impatient to see her. But I hope to have many other opportunities of improving so desirable an acquaintance, as she is to pass the winter here. You have visited her frequently since her arrival at B——, have you not?"

"Oh, often!" Cora really thought that she was speaking sensibly and truthfully of the three visits she had paid her aunt in the present residence.

"She lives in the suburbs, or nearly without the corporation limits of the town. I think I have heard," pursued Ellen.

"Almost in the country; but the outskirts of B.——are more eligible as building lots than any street in the city proper. The situation of aunt's house is glovly, and the neighborhood charming beyond description."

"Did you ever hear of a Mrs. Chester, thereabouts? Do you know whether there is a lady of that name, a widow with one child, I think, a resident of B——, or its vicinity?"

"Indeed I do! Her grounds almost adjoin Aunt Janet's. She is very wealthy, keeps up a princely establishment, is quite the leader of the ton, courted and aped by a host of admirers, Are you acquainted with her?"

"I have never seen her," began Ellen; but Cora, volatile as usual, interrupted her.

"Then you have missed the sight of a handsome, a queenly woman. She might rival her daughter in belleship if she chose, but she is too dignified to listen to a whisper of such a thing. I admire her greatly."

"You have met her, then?"

"Scores of times. She and Aunt Janet are extremely intimate. One of the most pleasant days of my life I owe to her hospitality. Her lawn, and gardens, and park are a perfect paradise. In strolling through them, one forgets that there are unsightly objects or painful subjects in the world."

"You alluded to the daughter," said Ellen. "Her fame as a belle has reached my ears before this. Is she as admirable as her mother?"

"Quite as beautiful in person, and more winning in demeanor," rejoined Cora "She is witty, without being sarcastic; accomplished, yet not pedantic; affable, without affectation. At the parties we attended together, she was the most elegant, and at the same time the most simply-attired, lady in the room. Her kind heart gives a certain inimitable grace to her most trivial action. I loved Mary Chester from the earliest moment of our meeting, and parted from her with more regret than I experienced in leaving all the rest of my friends in B——."

"I am afraid I shall grow jealous of your enthusiastic affection for her, if she makes us the visit our parents have planned so long," said Ellen. "However, I will take lesson of her in amiability, and try to rejoice in her pleasure at meeting one she knows and loves, amongst so many strangers."

"Why, you said you had never seen her!" exclaimed Cora.

"Nor have I. That treat is yet in store for me. Our mothers were schoolfellows and boon companions in their girlish days, and their correspondence has not ceased through all the years that have brought age and cares upon both. Recently, there has been a deal of conference respecting an exchange of visits. Several times have been actually set, which have passed without the accomplishment of the important event. At present, the scheme is

AFTER FOUR YEARS OF MISERY

Cured by Lydia E. Pinkham's Vegetable Compound

Baltimore, Md. — "For four years my life was a misery to me. I suffered from irregularities, terrible dragging sensations, extreme nervousness, and that all gone feeling in my stomach. I had given up hope of ever being well when I began to take Lydia E. Pinkham's Vegetable Compound. Then I felt as though new life had been given me, and I am recommending it to all my friends."—Mrs. W. S. Ford, 1938 Lansdowne St., Baltimore, Md.

The most successful remedy in this country for the cure of all forms of female complaints is Lydia E. Pinkham's Vegetable Compound. It has stood the test of years and to-day is more widely and successfully used than any other female remedy. It has cured thousands of women who have been troubled with displacements, inflammation, ulceration, fibroid tumors, irregularities, periodic pains, backache, that bearing-down feeling, flatulency, indigestion, and nervous prostration, after all other means had failed.

If you are suffering from any of these ailments, don't give up hope until you have given Lydia E. Pinkham's Vegetable Compound a trial.

If you would like special advice write to Mrs. Pinkham, Lynn, Mass., for it. She has guided thousands to health, free of charge.

for Mrs. Chester and Mary to come to us about the latter part of January; but hope deferred has rendered us incredulous of its final fulfilment."

Cora brightened visibly. Almost two months off, and an uncertainty at the best, which would, unquestionably, be the worst for her! No need for her to brood upon the idea that she had given Ellen an erroneous and unpardonably highly-colored version of the history of her association with the Chesters. She had seen them repeatedly at church and in other public assemblies; had scrutinized the daughter across the room at one large party, where her chaste elegance of apparel and engaging behavior made her the observed of all eyes. Nay, Cora had even stood next her at supper, and received a graceful apology for a slight injury done to her robe by a falling spoon from Miss Chester's saucer, as her attendant was in the act of handing it to her. Mrs. Barrett, once in a great while, exchanged calls with her more fashionable neighbors, but her retired habits formed too decided an opposite to their gay life to make intimacy likely or possible. The day spent at the Chester mansion was a picnic, held during the absence of the proprietors, and by permission of the steward, in the park of noble old trees that constituted the principal attraction of the place. Cora would have blushed at the suspicion that she had stooped to subterfuge to exalt her personal importance in the eyes of Horace's connections, yet this motive was the spring that had hurried her into culpable misrepresentation. An uncomfortable foreboding would, notwithstanding her attempts to feel easy and unconcerned, find entrance to her thoughts for an hour or so after Ellen's departure, but her native and habitual buoyancy enabled her to shake it off.

"I fear tath Horace is taking an imprudent step in this new venture of his," said Mr. Manning, one morning. "He is a sagacious man of business for one so young; but he is young, and, it may be, has not counted the cost and risk of extending his operations in these troublous times."

"He impresses me as a person of singular judgment for his years," said Aunt Jane, noticing Cora's uneasy look. "Have not his actions heretofore been characterized by prudence?"

"Yes, I suppose they have," commenced her brother, who was a cautious man, and slow of speech.

Cora broke in, eagerly: "Oh, papa! you know that he is discreet. I have heard you say, five hundred times, that he had the oldest head you ever saw upon young shoulders. It is unkind to depreciate him now, when this is the only measure of doubtful propriety he has ever adopted."

"While the wisdom of the measure remains a question, it is but fair that he should have the benefit of the doubt," remarked the ever kind aunt.

Mr. Manning patted his daughter's head. "Agreed, with all my heart! You must not fly out at your father, puss, until you are sure that he means to find fault with a noble friend of yours, whom we all like, although there are degrees of fondness amongst us."

"But you do not really apprehend loss for him, do you, sir?" inquired Cora.

"I cannot say that I do, dear; I merely intimated that his course was a bold one; I feared lest it should prove unwise also, in view of the breakers ahead of business men. I do not understand his drift, but I imagine that he does, so it's all right, perhaps."

"He will outride the breakers, if any one can," said Cora, confidently. "His is a steady eye and hand."

"And a true heart, you might have said," subjoined Aunt Janet, as her niece stopped, confused at the warmth she had manifested in her lover's defence. "Might not a word of caution from you be of use to him?" she continued to Mr. Manning.

"I would have spoken it, had he consulted me at the beginning," was the reply. "I fancy that matters are now in such a state of forwardness that objections would dishearten him, without altering his purpose. My fears may be false prophets, after all. We will hope for the best, and let him have his own way."

Horace did not appear very sanguine as to the result of his enterprise, when he unfolded his plan to Cora. "It may be that I have been rather precipitate," he said, "have trusted too implicity to the representations of others who ought to be better informed in these affairs than I am. I am getting timid nowadays, I have so far greater happiness at stake than formerly. Something more than my own comfort or profit depends upon my success or failure. My pride and joy in our mutual relations is still so new and precious that I am in continual dread of losing it—the common fate of those who have become rich suddenly. Forgive me, love, for troubling you with pecuniary projects. I am ashamed of my selfishness in unburdening my heart of its cares, the details of which must be annoying to you."

"Nothing is annoying or uninteresting that relates to you, answered Cora, with an ingenuous affection for which her auditor honored and blessed her from his inmost soul. "I am troubled, but it is at seeing you cast down. I should be more distressed, if you showed a disposition to defraud me of my right to sympathize with you. Have you any reason, apart from your presentiments, for doubting the expediency of your recent transactions?"

"None, if I except the ominous nods and sighs of a few croakers, and the lowering aspect of the commercial horizon. I called several times at your father's office, while the business was undecided, in the hope of persuading him to the gift of a few words of advise, but was invariably so unfortunate as to find him out or engaged. Has he passed any opinion upon my proceedings in your presence?"

Cora hesitated. The truth, unpalatable as it would be, was upon her lips; then a second glance at his anxious face summoned to her memory her father's concluding remarks: "Objection would dishearten, without altering his purpose. We will hope for the best, and let him have his own way." "We were speaking of the subject yesterday," she replied, as if trying to recall the conversation. Her courage failed fast at seeing his intent expression.

"Well," he urged, as she paused again, "did he pronounce me a headstrong speculator?"

"No, indeed! He declared his entire confidence in your talents and judgment."

"Xcepting as I have displayed them in this one case," suggested Horace, with an attempt at gayety.

"He made no exception, but was hopeful for this, as for the rest of your undertakings."

"Ah! he approved it, did he?" exclaimed Horace, joyfully. "This is too good news to be true! Are you sure that there was no dissatisfaction, no prophecy of evil, mingled with the grateful sentence?"

"He said that yours was a steady eye and hand, which, united with a true heart, made failure almost impossible," said Cora, proud of the enlivening effect of her communication. "Aunt Janet was not backward in expressing her cordial assent to this."

She was doing him a signal favor in thus turning the bright side of the picture to him—in unloading his mind of fears that would impede his progress.

"You are a comforting angel," he said, fondly. "It is almost a luxury to be despondent now and then, so sweet is the cure. I am unwilling to confess how utterly the knowledge of your father's sentiments has revoluntionized my feelings. He would have bestowed his counsel very sparingly, had I solicited it in person. Conscious of this peculiarity of his, I did not persist in my design of wresting an opinion from him. I have boundless confidence in his sound sense and farsightedness. I came here, to-night, depressed and irresolute. It was my wish to see him for a few minutes in private, and ascertain, if I could, how he stood affected with regard to this somewhat bold enterprise. I was ready—more than ready—anxious to abandon it at the eleventh hour, at a single dissuading word from his mouth. How happy am I that I made you my confidante instead, and, by this manoeuvre, became possessed of his most candid decision, unbiased by any desire to conform to my inclinations!"

"Had you better not consult him, as it is?" asked Cora, faintly.

"O no! There is no necessity or propriety in doing so. He is careful to a fault, and never would have employed the language you have quoted, had he not been altogether satisfied with the wisdom of my course."

"The language you have quoted!" How mockingly conscious repeated the phrase, as Cora tossed upon her sleepless bed!

"I wished to spare him needless pain," she alleged, in excuse; "I meant it for his good. It cost me a struggle to speak as I did; but could I bear to see him sad, and not strive to console him by any sacrifice of my comfort? How could I forsee that he who is generally so independent in forming plans, so resolute in their execution, was prepared, on this occasion, to be swayed by a word from another? I hope no evil will come of it. I will not allow that he can be defeated by any enemy; he is bound to succeed."

"If he should fail—and failure has come to others as keen of sight and brave of heart—who is to blame for it?"

Calves Raise Them Without Milk Booklet Free A. Archibald & Co., Truro, N. S.

sneered the tormentor; and Cora, dump at this home-trust cried herself to sleep over the bare imagination of this sequel to her "well-meant" consolation.

A month went by, and nothing had occurred to arouse the fears which had sunk into a lethargic slumber almost as quickly as the pillow wet by her tears was dry. Life was one continued smile of love and beauty to the betrothed maiden. Preparations for the marriage were going forward steadily and quietly. Friends gathered lovingly about her whom they were to resign to care yet more tender and constant, when spring should furnish her first flowers to grace the bridal feast.

It was on a balmy day, which she could have fancied had been sent in advance to remind her most vividly of the bliss of the approaching season, that Cora left home on a mission of mercy—to carry some of the sunshine with which her soul was filled to the chamber of the sick and languishing. Constance Remer was a universal favorite with her associates, each one of whom she converted into a friend. Young, loving, and beloved, she tasted, with a glad and thankful heart, of earth's best treasures, until the Father, All-merciful as All-wise, interposed to save the tempted soul from idolatry. Very gentle was the summons—painless and gradual her withdrawal from an existence whose every hour had been marked by its blessing and its corresponding joy; so calm her passage towards the heaven of never-ending happiness that she, and, what, was more remarkable, those who were nearest and dearest to her, but dimly suspected the truth It was, therefore, with nothing of fear, with hardly a shade of solicitude in her manner or feelings, that Cora inquired concerning the invalid's state, of the physician, as she happened to meet him a square from Mr. Remer's dwelling. Dr. Merrill was a blunt man, when it suited his humor and convenience so to be At that instant, he was pondering upon Constance's case—not weighing the chances for and against her recovery, but speculating mournfully as to the greatest length of her stay among those who little dreamed of the impending woe. His reply to Cora was abrupt and startling:—

"She is as well as she ever will be again, poor thing!"

"Doctor," ejaculated Cora, "Do you mean that—" She could proceed no farther.

"I mean that she is dying," returned the Doctor, wheeling about, and joining her in her walk. "She may live three weeks; she may not see three more suns rise in this world. It would not be a matter of surprise if to-morrow's sun shone upon her lifeless body."

They walked a little way in silence Then Cora queried, tremulously." Is she aware of her condition?"

"No. Why should she be? She is ready for death; that her life has proved, better than any dying triumphs could do. If she were not, it is too late to begin this work. She has no unsettled worldly business to attend to, and that is, to my notion, the sole reason that justifies one in molesting the sick in the hour of moral extremity. Doctors and friends often bungle wretchedly on this point. No! No! I believe in no such miscalled kindness. Let the child pass away peacefully. Human nature is alike, the world over. She would feel alarmed at the near prospect of dissolution, little cause as she has to dread an exchange of worlds; or grief at leaving those she loved might be as disastaous, and hasten the event which it is our aim to delay. To reveal the truth would be an act of absolute cruelty—downright inhuman!"

They were at Mr. Remer's gate, and with an additional injunction to Cora "to do her prettiest to cheer his patient," the Doctor bade her "Good-day."

RED ROSE TEA.

"Is Good Tea".

VANCO CANADIAN MADE

Lime Sulphur Solution

shows on analysis a higher percentage of active sulphur in solution than other brands or the home-boiled article. It is therefore more certain to thoroughly destroy all parasites and fungi, including the San José Scale.

VANCO is a clean solution—free from useless sediment—all good. One barrel makes 12 for winter or 50 for summer spray.

$8.00 per bbl. f.o.b. Toronto.

Lead Arsenate

kills 95% of codling moths where Paris Green at its best will not kill over 75%. It is a sure destroyer of all leaf-eating insects. Easy to spray as it settles slowly and does not clog the nozzle.

Sticks much better than Paris Green. **Never burns or injures the foliage.**

The majority of experts and authorities throughout Canada and the United States have adopted Lead Arsenate.

10c. to 13c. per lb. according to quantity.

DIRECT *from* FACTORY *to* KITCHEN

SAVES *all* MIDDLEMEN'S PROFITS

818 or 918--Elevated Tank or Flush Reservoir for Coal and Wood.
Made of the Best Blue Polished Steel and Malleable Iron.

The "Dominion Pride" Range

MADE IN CANADA and is placed on the market in response to a demand for a **Range** combining the sterling qualities of **Malleable Iron** and **Polished Steel, Unbreakable, Unwarpable, Indestructable, Economical, Design Attractive, Perfect Cookers and Bakers, will Last a Lifetime with Proper Care.**

The ordinary cast iron range is at best a disappointing investment to the purchaser, so soon does it exhibit the effects of wear and tear, unavoidable in a range constructed of such frail and brittle material. The Combined Malleable Iron and Blue Polished Steel Range is the nearest approach to **Absolute Perfection** ever designed for **Comfort, Economy** and **Satisfactory Domestic Service** and wherever installed it will prove itself a continual object of **Satisfaction.** The price at which it is supplied is so modest that it is brought easily within the reach of every prudent family.

GUARANTEE

"Dominion Pride" Ranges are sold on the following Guarantee: If any casting proves defective in twelve months from date of purchase, we will furnish same free of charge. The above Guarantee is very broad, no if's or and's, and any casting that would have a flaw in it that we failed to see in the course of construction, such flaw would show long before the twelve months have transpired when fire is put in range.

INCOMPARABLE OFFER

Our placing direct to the consumer our High Grade **"Dominion Pride"** Malleable and Polished Steel Range, as fully described in our descriptive circular and guaranteed, for less than you can buy a cast iron range. We are enabled to make this extraordinary offer by our **Direct from Factory to Kitchen Plan,** which saves the jobbers, retailers, traveling salesmen and their expenses, giving the consumer the benefit of these savings, which in reality enables the consumer to buy as cheap as the wholesale jobber.

PRICE

Why not buy direct from the **Manufacturer** and save the middlemen's and retailers' profits? **"Dominion Pride" Range** if sold through the retailer or traveling salesman would have to be sold for $69.00 to $78.00, according to the territory sold in. Our price, direct to the consumer, is as follows: **"Dominion Pride" Range,** 8-18 or 9-18 top, with high closet shelf and elevated tank or flush reservoir, with piece of zinc to go underneath range, 8 joints of blue polished steel pipe and 2 elbows, delivered to any railway express station in Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island for $41.00 **(We Pay the Freight),** and delivered to any railway express station in Manitoba, Alberta, Saskatchewan and British Columbia for $49.00 **(We Pay the Freight),** $5.00 to accompany order, the balance to be paid when range is delivered to you. If not convenient to pay cash, will accept your Note.

Write for our Descriptive Circular.

CASH PRICE **$41** Delivered to any Railway Station in Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island. We pay the freight.

CASH PRICE **$49** Delivered to any Railway Station in Manitoba, Alberta, Saskatchewan and British Columbia We pay the freight.

OUR DIAMOND JUBILEE YEAR

PAQUET GUARANTEED CLOTHES

Made to Your Measure, But NOT Custom Made.

THIS looks paradoxical, but it's none the less true for all that. What's more, we can prove it to your entire satisfaction, and stand ready to refund your money, if you are not ABSOLUTELY SATISFIED with your Clothes when they arrive.

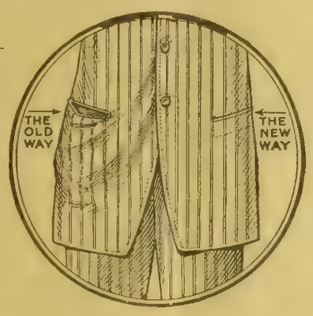
PAQUET Guaranteed CLOTHES, as their name implies, are GUARANTEED to fit you perfectly. All Ready Made Clothes are cut and made up to fit AVERAGE types, not REAL men. That's why they don't fit YOU. And they can't be MADE to fit, either, without being all ripped up and recut—a very expensive undertaking, and, therefore, out of the question.

PAQUET Guaranteed CLOTHES are cut to fit BEFORE they are made up at all. That's why we can GUARANTEE them to fit PERFECTLY. Our new style book tells all about our method of Clothes making. PAQUET Guaranteed CLOTHES are GUARANTEED to be the best value in Canada to-day at from $10.00 to $14.25—worth $13.50 to $20.00.

The Suit Illustrated

is made from absolutely PURE WOOL, navy or black serge, best Indigo Dye, thoroughly shrunk and absolutely guaranteed to keep its color. The workmanship is unexcelled in this country. The real value is $13.50. Our special price, PREPAID to any part of Canada..... $10.00

Sizes 36 to 44 only. Larger sizes 75c per size extra.



The Suit Illustrated

is made from absolutely PURE WOOL, navy or black serge, best Indigo dye, thoroughly shrunk and absolutely guaranteed to keep its color. The workmanship is unexcelled in this country. The real value is $13.50. Our Special Price, PREPAID to any part of Canada..... $10.00

Sizes 36 to 44 only. Larger sizes 75c per size extra.

The Famous "BARTELL PATENT" Pockets

are used in all our garments. This is a feature well worth considering. BARTELL PATENT Pockets will not sag nor gap and will retain their shape permanently. This feature not only greatly improves the appearance, but adds to the life of any garment. BARTELL PATENT Pockets are to be found only in the highest grade Clothes, which is one of our reasons for adopting them for use in the making of PAQUET Guaranteed CLOTHES.

Do Business Girls Make Good Wives?

What can a girl get out of business life, that will help her in her married life?

This is a question that is at present revolving in the minds of marriageable young men. Some persons persist in saying that they can not, or at least do not get anything that is of value in the art of home making. Such people talk without reckoning wisely. Teachers, college girls and business girls smile at the idea, and have so far failed to see why experience and knowledge of any sort should interfere with the career of home and mother. From the beginning, the business girl is taught the value of system, the very basis of good housekeeping and without which no woman can successfully manage a home.

The girl who has worked for her living before marriage, knows what her husband goes out to every morning, whether office or farm, and fully realizes the many annoyances and discouragements he is sure to encounter. So she meets him, not only with intuitive sympathy, but with an intelligent understanding of the situation which alike soothes

O. K. AUTOMATIC POTATO PLANTER.

Troubled With Backache For Years.

Now Completely Cured By The Use Of DOAN'S KIDNEY PILLS.

Mrs. W. C. Doerr, 13 Brighton St., London, Ont., writes:—"It is with pleasure that I thank you for the good your Doan's Kidney Pills have done me. Have been troubled with backache for years. Nothing helped me until a friend brought me a box of your Kidney Pills. I began to take them and took four boxes, and am glad to say that I am cured entirely and can do all my own work and feel as good as I used to before taken sick. I am positive Doan's Kidney Pills are all you claim them to be, and I advise all kidney sufferers to give them a fair trial."

Let Doan's Kidney Pills do for you what they have done for thousands of others. They cure all forms of kidney trouble and they cure to stay cured.

Price, 50 cents per box or 3 boxes for $1.25 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering specify "Doan's."

Bowmanville, Ont.

and inspires. She assists her husband with her heart as well as her brain. Then a girl of average intelligence becomes broader minded as a result of business experience, and when she leaves the school or office for a home of her own, leaves her narrow mindedness behind. She has come in contact with educated, refined people and it has left its impression.

Now it is worth something to a young man who has his fortune to make, that his wife has the same outlook on life as he, that their worlds are not different. Business life has buried deep in her character a taste for intellectual things. Her coffee, like his, has a better flavor at breakfast because she has the ability to comprehend and discuss the things that please him. It is this wider outlook on life that crowds out of a woman's character, the pettiness that makes our natures positively ugly sometimes. Then the business girl learns the value of money. How to spend it economically is quite as important as how earn it. In the first place the average business woman does not spend all she earns on herself; in the second place the average husband will see to it, that his wife has only a reasonable amount of spending money, (in many cases not even a reasonable amount) and in the third place, she has learned from business that co-operation is an invaluable principle, and unity of purpose is essential in any undertaking where more than one person is concerned.

Responsibilities train girls to meet difficulties and overcome them; to look on complications as the natural cause of events. Managing is no longer fearful to her, she is not easily "rattled." This type of woman transferred to the home puts the society girl, who has been made selfish by idleness and a butterfly life generally, at a pitiable disadvantage. A girl coming in daily contact with sensible measures of economy, is not likely to forget them when she becomes a partner in the business of marriage. The old adage that "men must work and women must weep" is not suited to this age. The day of the whining, simpering wife is past—she has no place in the great whirl. Self-repression, self-reliance, dignity and virtue—these are qualities that ripen in an atmosphere of hard work, and the sensible girl in business will prepare herself far the future by improving the present. Naturally possessed of the gentler virtues, they find in business a few of the Spartan, which are quite essential in order to cope with the disadvantages and harhships many of us meet. These girls are able to assist their husbands by a good round of sound sense in managing, planning and devising ways and means. She knows that in this age money comes hard, therefore spends prudently.

The business girl has dicipline, and has learned to bend her will more or less to others opinions, yet has a wholesome independence that comes from nothing in the world so much as the knowledge that she earns her daily bread. She has also tact, which is quite necessary in the managing of some husbands. When he comes in tne house tired and nervously exhausted by his contact with stubborn nature—all struggling for self—she understands his feelings, she knows, because she has "been there."

But I have yet to speak of the most important feature of the business woman—one that affects us all—her offspring. Is it not our greatest pleasure to have our children bright, intelligent and active? Is it not worth more to us, when we have done with the things of earth, to leave a family of well trained boys and girls who will make good citizens, than a bank account? Has she

Truth About Roofing

The first edition of "Truth About Roofing" has been completely exhausted. So we have been compelled to publish a second edition of this famous booklet. This is an improvement on the first edition. It goes right to the "heart" of the roofing problem. It tells the truth about wooden shingles, prepared roofing, slate and steel shingles. It shows the cost per year of service of the different roofing materials, which is the only method of arriving at a correct conclusion as to which material is the best roofing investment. It explains the British Government's Acid Test and our Free Lightning Guarantee.

PRESTON SAFE-LOCK SHINGLES

The information contained in this booklet we believe is accurate. We have taken pains to see that every statement we make can be verified. You can rely on this booklet to guide you right in the choice of roofing materials. We should really charge you something for this booklet, but we will send it FREE as a reward to all who fill in, cut out and mail the coupon to us by return mail. 7

Agents Wanted all over the Maritime Provinces

not imparted a goodly share of brain, ability and principle to her children? Will she not be able to guide little feet all the more wisely because she learned to govern herself long ago?

Many of our farmers' daughters are fitting themselves for teachers, stenographers, clerks, book-keepers, nurses, etc. True it takes them away from homes where they are sometimes needed, yet in a way it is all right. When our young men want wives they are getting back again on the farm, these girls who have been benefitted and improved by their contact with the business world. It has brightened them up, given them a keener conception of things, awakened new possibilities, and generally fitted them to fill an honorable position anywhere. Some one will say "they cannot cook." Well suppose they cannot. Will they not use the same brain to learn, that they used to demonstrate a proposition in Geometry? Will they not use the same judgment that they would in a business transaction? Will they not use the same economy that started their bank account? Yes surely. She will mix her first loaf of bread with brains, and with brains she will continue to supply her table with dainty and well cooked fooh. Of course we must not generalize too freely, but experience and training must have their value; and no one in the world so appreciates the wisdom and rare qualities of the man who carries on any kind of business, as does his wife, if she herself has once been a business woman.

FARMER'S WIFE.

Andover, N. B.

Forage Crops for Sheep.

The wise shepherd in planning his crops for the year has regard to the needs of his flock. He recognizes the great advantage of providing not only a variety of foods but a succession of sueculent crops the season through. Bulletin No. 12, "Sheep Husbandry in Canada," published and issued free by the Live Stock Branch at Ottawa, takes up this subject in a practical and thorough manner. Under special crops for sheep it deals with clover, alfalfa, vetches, rape, cabbage, turnips, mangels, corn and the several classes of grain. Each is treated separately in regard to method of cultivation and manner of feeding. Dealing with vetches the bulletin says:

"Vetches, or tares as they are also called, make excellent fodder lor sheep, either as a soiling crop or as cured hay. This crop much resembles peas in habit of growth and requires about the same kind of cultivation. Its vines are more slender than the pea vines and stand up better when grown with the stiff variety of oats. Vetches are grown extensively for sheep feed in Great Britain, and to some extent in Canada for the same purpose. The writer, while raising sheep, always grew a small area of tares with oats for soiling the show flock, and in case of a shortage of clover vetches were cured for hay. The crop being fine in vine and very leafy is much relished by sheep and constitutes a rich diet.

"Two varieties of vetches are grown for fodder. The common vetch is the chief sort cultivated, but the hairy variety is receiving some attention. The latter produces the heavier yield, but so far the seed having to be imported is very expensive and few care to bother with it.

"The soil for vetches should be clean, mellow and rich. The seed may be sown in drills or broadcast. A good seeding for either soiling or hay is about three pecks of vetches and four pecks of oats per acre. The vetches are ready to feed any time after the crop comes into blossom and before the seed commences to ripen. For soiling the crop may be hauled to racks, or be distributed on the sod of a pasture field as soon as cut, or it may be allowed to wilt in the swath for a few hours. Vetch hay is made in much the same manner as clover or timothy is handled. Vetches may be pastured by sheep, but this is a wasteful practice, as much of the crop in destroyed by tramping."

Sheep raisers who do not already possess a copy of this bulletin would do well to order one from the Live Stock Commissioner at Ottawa.

RATHER STALE BREAD.

"What! a loaf of bread over 1,800 years old? Nonsense!" Well, my friend, there is no nonsense about it. You can see several of them in the Royal National Museum, at Naples, burned black like carbon, or charcoal. They were found in the ruins of Pompeii, a city that was buried by an eruption of hot, fiery ashes from Mount Vesuvius in the year 79. No one could eat this bread, although carbon is the element in our food that promotes heat in the body.

When Indigestion prevails, your food does not nourish you and you have headaches, poor blood, constipation, dizziness, and other ills. Mother Seigel's Syrup, the sure herbal remedy cures all these ills. Mr. Burton Shortliffe, Central Grove, Digby Co., N.S., writes:—"I was troubled with Indigestion for a long time and found no medicine to give such immediate relief as Mother Seigel Syrup. For Indigestion and all Stomach Troubles it is a grand remedy."

The "BACON" Seed Drills and Cultivators

The only Rear-Wheel Driven Seed Drill on the market. The feed in the "Bacon" handles seed without bruising or breaking, and seeds evenly to the last seed. Machine instantly converted from a regular seed sower into a hill dropper. Feed Cut prevents waste of seed when turning rows.

For sowing Sugar Beets, Parsnips, Radishes, Carrots, Onions, etc., the 1908 model of the "Bacon" is unequalled for strength, lightness, easy running and good work. Write for our complete catalogues.

THE EUREKA PLANTER CO. Limited Woodstock, Ont. 2

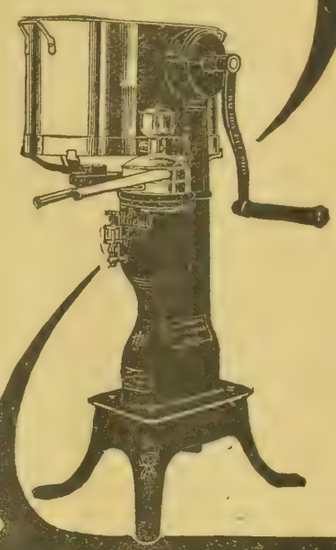
THE I H C LINE

To Bigger Dairy Profits

BUYING a cream separator is a mighty important proposition with you. There is a vast difference between makes. So you must investigate thoroughly before you decide—in order to get the right one. I H C Cream Harvesters are invariably the choice of those who look into the merits of all separators. The I H C line offers the most advantages. The more you know about other separators—the more you will appreciate an I H C.

It is just as poor economy to own a poor separator as it is not to own any. Such machines are expensive at any price. When you buy a separator—buy a good one. It's the only kind that it pays to own. Choose one of the

I H C Cream Harvesters



—for their money-making advantages are proven. You take no chances—you do not pay for an experiment. I H C Cream Harvesters skim to a trace. You get the limit of butter-fat from the milk. An I H C Separator is simple and easy to clean. So you get quality cream—and fresh, warm, pure skim-milk for the calves. And the I H C Separator is so easy running that any member of the family can turn it without effort.

There are two styles in the I H C line—the Bluebell, gear drive, and the Dairymaid, chain drive. Four sizes in each style offer you a wide choice to select from. One of the I H C Cream Harvesters will meet your needs. No matter which one you choose, it will greatly increase your dairy profits for years to come. The materials and workmanship are perfect. See the International dealer before you buy any separator. Don't decide till you know what an I H C Separator will do for you. If you prefer—write the International Harvester Company of America at nearest branch house for further particulars.

Potato Growing.

(Continued from page 433.)

on without its draw-backs. The principal ones are the Colorado bug, the blight and the scab. However, these can be offset quite readily in most cases.

The regulation treatment of vines with Paris Green, mixed with flour and dusted on the leaves, while damp with dew or wet with recent rain, has proved an excellent exterminator for this pest. Spraying with Bordeaux mixture is most effective where blight has appeared upon the potato vines. This treatment is satisfactory in case of both early and late blight, and should be repeated at intervals of from 10 to15 days, until the disease is conquered. The addition of 1½ pounds of Paris green to 50 gallons of the Bordeaux mixture will check the ravages of the beetles whenever they appear as co-workers with the blight.

Scab may be prevented by soaking the "seed" potatoes about two hours in solution made by putting one pint of formaldehyde in 25 gallons of water. The potatoes may be soaked before cutting, then handled in the ordinary way, care being taken not to allow them to become contaminated by coming in contact with bags, bins, etc., that have held scabby potatoes. Perhaps a smaller amount of solution might suffice in a case where only one acre was to be planted. Fifteen gallons of solution will treat about 20 bushels of potatoes. Plant on ground that has not grown potatoes before, as the potato scab spores will remain verile in tne ground for a number of years.

The Dominion Exhibition.

The management of the Dominion Exhibition writes as follows: In a short time the prize list for the Dominion Exhibition, to be held in St. John, September 5th to 15th, will be ready for distribution. It will be the most interesting publication of its kind ever published in Eastern Canada. Not only will it explain the vast field of competition among farmers, breeders, manufacturers, dairy men, school children, household workers and others, but it will contain detailed information relative to the distribution of prize monies which in this case will be increased from 50 to 125 p. c. over former appropriations. This generous increase is possible through the grants of the Dominion, Provincial and Civic Governments. Cattle prizes, especially in the Shorthorn, Hereford, Ayrshire, Holstein and Jersey classes have been increased 100 p. c.; in the Clydesdale, Shire and Percheron horse classes the increase is to be 50 p. c.; dairy breeds of cattle will receive 125 p. c. more money than on previous occasions, while the sheep and swine classes will receive much greater incentive than heretofore. Poultry fanciers and breeders will be interested in a new system of judging and the prize list will vary with the number of entries in each class. Dairy awards have been revised upwards as well, after consultation with representatives of the Provincial Department. A notable feature in this section of the show will be the separation of the professional dairymen and the household butter maker; special prizes being awarded for each. In the Horticultural department the prize list has undergone a lot of changes, made with a view to improving the quality of exhibits. Naturally this has entailed the elimination of several classes of Apple, not fit for competitive purposes so early in the autumn. The funds with held on this account have been put into the new classes. Potatoes will be judged in a new manner; in-

Amatite ROOFING

Will End Your Roofing Troubles

IF you will write to-day for a free sample of "Amatite" the end of your roofing troubles is in sight. After you have submitted it to every test that you can think of, you will be prepared to order it not only for your *new* buildings, but for your *old* roofs as well. You will find that it is cheaper to cover them with Amatite than to continue painting and and repairing them.

We make a strong point of our "Free Sample" offer because the smallest sample of Amatite speaks for itself. It is more convincing than yards of talk.

There are all kinds of ready roofings on the market—so-called "rubber roofings," so-called "guarantee roofings," so-called "sand surface roofings."

The "rubber" roofings are no more made of rubber than a cow is made of saw-dust. The "guarantees" that are promiscuously handed out with many brands are hedged around with so many provisos that it will take three lawyers to dissect them and find out what they are all about. The "sand surface" has little or no protective value.

The point to remember is that all of these roofings have to be *painted* every year or two to keep them tight. In other words, it is the *paint* that protects, and not the roofing. If a man will sit down and figure out exactly what this paint costs, he will find that it is more than the roofing itself. Amatite, on the other hand, has a surface of *real mineral matter* and we sell the goods on the broad statement that you need never coat or paint this roofing.

You can lay Amatite on a roof and then forget all about your roofing troubles. *No painting, no coating, no worry.* The man who puts Amatite on his buildings is insured against leaks and trouble for many years.

Free Sample

If you have any doubts about the matter and want to investigate our claims, send for sample and booklet to-day. The sample tells its own story; the booklet is written for practical men. It hits straight from the shoulder.

Address our nearest office.

The Original "HALLOCK" Weeder.

The object of a weeder is to keep down the weeds, therefore, it resolves itself into this one fact: that a weeder should be used early and often, so as not to give the weeds a chance to grow. You will not injure your crops by working the ground directly over the plant or grain, but will do much toward increasing the growth and yield.

You can work them in dry or wet weather, they will not cut the roots of the crop, but cultivate just deep enough to retain the moisture just where it is needed. But, do not forget the old rule—Use the WEEDER early and often, and when you are all through with all kinds of other cultivators, our weeder will finish your job in No. 1 shape. Thousands in use. Write for prices and terms.

Send in your order now for the "HALLOCK" Weeder. Goods are now in hand, all orders will receive prompt attention.

ILLSLEY & HARVEY CO., Ltd.,

Hve you Live Stock for sale? If so, advertise in the Farmer.

stead of judgment in each individual variety, they will this year be classified in 6 types—White Round, White Long, Rose Round, Rose Long, Red and Black. The Women's Work and Household Science Department, also the Educational section have been included in the increase of prize monies.

Hopper Feeding.

I should like to tell my experience in hopper feeding for the benefit of other poultry keepers. Last year was my first attempt to raise poultry and not having time to feed them several times a day I decided on the hopper method and used hoppers from the time they were a week old. The first four weeks I fed them a commercial chick food and the next three weeks a commercial growing food. After that until they were sixteen weeks old, they were fed the following mixture:—

100 pounds cracked yellow corn; 100 pounds whole wheat; 20 pounds whole oats; 8 pounds kaffir corn, white and red mixed; 10 pouods buckwheat; 2 pounds sunflower seed; 2 pounds millet.

After they were sixteen weeks old, whole corn was given them instead of cracked. Everything was mixed together and fed from a box. I use a ½ inch mesh screen which lays on the top of the feed and settles down as they eat the mixture. Besides this feed they have good beef scrap, charcoal, grit and fresh water before them all the time. I always give yhem all the green stuff c can, but in town with small yards they do not get very much.

Last year I had about 125 Rhode Island Reds, all hatched in an incubator and raised in a brooder. The cockerels were sold when twelve weeks of age and averaged better than 2½ pounds each. At sixteen weeks of age two were killed that weighed 3 pounds 9 ounces and 3 pounds, 10 ounces respectively—dressed but not drawn. By September the oldest pullets were laying, being a little less than six months old.

I have failed to find any poultryman in this vicinity who uses the method of feeding whose birds have done as well as mine, and this makes me think hopper feeding is all right. —Subscriber.

Barley Fertilizing Experiments.

Editor Maritime Farmer:—

As I experimented last season with fertilizers on barley I am sending you the results thinking that they might be interesting to intending users of fertilizers. I took three plots of one quarter of an acre each and applied the fertilizer as follows :—

Plot No. 1 Unfertilized.

Plot No. 2 100 lbs, Muriate of potash per acre. 300 lbs. Acid Phosphate per acre. 100 lbs. Nitrate of Soda per acre.

Plot No. 3. 300 lbs. Acid Phosphate per acre. 100 lbs Nitrate of Soda per acre.

The plots were all seeded down to clover and timothy. The Potash and Phosphate were sown broadcast and harrowed in with the crop, while half the Nitrate of Soda was sown when the crop came up and the balance eleven days later. This grain was cut, threshed and weighed, 48 lbs. being allowed to the bushel.

The yields on the various plots were as follow :—

Plot No 1. 25 bus. 24 lbs.
Plot No 2. 52 bus. 40 lbs.
Plot No 3. 30 bus. 40 lbs.

The season was very wet and it was late when the grain was sown. Then a drouth set in and stopped growth. The fertilized plots were not nearly so much affected as the unfertilized plot by the dry weather and kept up a much stronger growth all through the season. The clover on plot No. 2 (complete fertilizer) was very strong, No. 2 (without potash) was fairly good while the growth on plot No. 1 (unfertilized was very weak and spindly. I am sending this without any remarks and will leave farmers to form their own opinion.

BYRON McLEOD,

Lime Sulphur Wash verses Berdeaux.

Editor Maritime Farmer:—

In your issue of Feb. 8th, Mr. J. C. Norton asks, what the writer had to say at the N. S. F. G. A. meeting at Kentville, about the use of Lime Sulphur Spray. This was replied to by Mr. F. H. Johnston who gave a formula for home boiled, which is alright for a winter spray, for those who have lots of time to prepare it. But the Home boiled is not as safe to use for summer spray as the factory made, which is carefully tested by experts and guaranteed a certain banner standard, from which there is no danger of burning the foliage if directions on the bonds are carefully followed out. It is very simple to use, fill up the spray casts with water, draw from the Lime Sulphur cask one gallon or whatever strength is required and pour into Spray Barrel without any straining. The writer sprayed 40 acres of orchard last year without ever having a nozzel clog once. With Lime Sulphur one can get over the trees in one-third less time than with Bordeaux, which is very important in catchy weather as all varieties have to be sprayed within a week after the blossoms fall in order to catch the codling moth.

To show that Lime Sulphur is past the Experimental stage, read what the highest authority in America says, Cornell University, Ithica, New York, L. H. Bridey director writes Nov. 6th, I909, "The particular orchard where the work was carried on, Greenings sprayed with Niagara Brand of Lime Sulphur and Bordeaux Arsenate of lead used in each case gave results very much in favor of Lime Sulphate wash. The trees sprayed with Bordeaux showed 82% of the apples russeted many of these so badly defaced and distorted in form as to seriously harm the appearance of the fruit. On the trees sprayed with Lime Sulphur and Arsenate of Lead the codling moth injury was reduced to I.3%. Prof. A. L. Melodes of State College at Pullman, Wash., under date May 8th, I909, said, "Many say along Eastern Washington it has given us very good results much better even than Bordeaux, and there is not the attendant danger of scorching the fruit and foliage when using Lime Sulphur wash. "I may add that I have received information from orchards in Illinois and Georgia where a great many hundred acres of orchards have been successfully treated with Lime Sulphur wash during the past year." Again in a letter dated Feb. 7th, I9I0, Prof. Mulander sums up by saying "I believe you will find Lime Sulphur wash is a more efficient fungicide than Bordeaux."

In I909 Pullman Station issued Bulletin No. I6 which said "Lime Sulphur wash eliminates the scorching so often produced by Bordeaux in rainy seasons."

Mr. L. Ceaser, of the Ontario Agricultural College, at Guelph, says Line Sulphur controlls apple scab in a very satisfactory way. In a test with Flemish Beauty pears last season Mr. Ceaser got them absolutely clean with Lime Sulphur "Vanco Brand" while the surrounding trees sprayed three times with Bordeaux had considerable scab on the fruit and leaves. In conclusion I may say about 50 different fruit growers in the Annapolis Valley used Lime-Sulphur wash last year. "Niagara Brand," everyone will use it again this year. It is now manufactured in Canada saving duty and extra freight which if time is considered will make it cheaper per spray cask than Bordeaux. Some have raised the cry that Lime Sulphur will wash off with rains quicker than Bordeaux. If Arsenate of Lead instead of Paris Green (which is not advisable to use ever with Bordeaux) is used it will stand wet weather as well as the former and also there will be no danger of burning the leaves like Paris Green.

POULTRY.

Hatching with Hens.

If a hen is to be used in the hatching out of the eggs, and where only a few chicks are desired it is always best to depend on the hen, and she ought to be picked out from the flock, writes C. E. Peterson in American Poultry Journal, as one worth keeping when the culling took place in the fall of the year. A good brood hen is a joy for ever, or at least as long as she lives, and ought to be carefully treasured for this purpose. There are hens and hens, you know that; there is the hen that you can handle and take from the nest and she seems to know that you are her friend and not her enemy and then there is the other kind—she begins to stand up on the eggs when she sees you coming, and before you get near enough to the nest to get your hands on her she flies in your face with a yell of terror and makes a commotion such as sets the whole plantation screaming from one end to the other, and every other sitting hen is now on the watch for some terrible happenings, while their curmudgeon is yelling out her hearts desire.

DESIRABLE BROOD HENS.

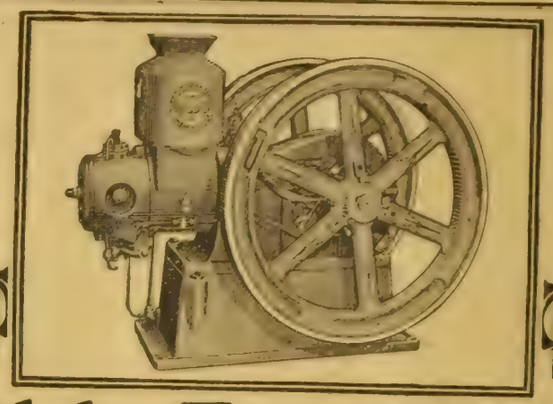
Now the first mentioned hen is the kind that makes a desirable brood-hen and will watch over her flock, carefully lead them around, let you handle them and her and clean out the premises and full well knows that you will not hurt either her or her little ones.

The other hen shodld never be used as a hatcher or brood hen, as in either capacity she will be very undesirable and more than likely ruin the eggs before they are hatched, and if she should manage to hatch them kill many of the chicks before she is ready to shake them off, or if she does manage to see them through she will make every one of her brood exactly like her own self, wild and unmanageable, which is very much to be depreciated in fancy poultry, as one of the chief pleasures in this occupation is to have your birds tame and easily managed and ready to be handled at all times when this becomes necessary.

DO NOT SET DISEASED HENS.

A few good docile and motherly brood-hens are an accessory to every establishment where fancy poultry is raised that is not to be despised. It is common at this time, when setters are in demand, to purchase them whenever they can be gotten and of any sort of breed and variety, and except the greatest care is taken this may be fruitldl of much trouble in the rearing of the young and their future excellence. Roupy birds have at this time of year been introduced with this dreadful disease lingering in their systems, and though no visible sign of it the germs are still present and ready to do damage to the flock into which they are introduced.

Now in most every case it can be detected by a rather unpleasant performance, namely, open the bill of the bird, and by getting a smell of her breath if any trouble the foul oder will be there to a more or less extent. We firmly believe that this



Olds Engines

Send for our new catologue.

YOU can learn engine facts you really should know before deciding on your gasoline engine.

The catalogue proves why it is good judgment to own an Olds engine and be sure you have the most practical, most economical, most durable rather than to get a cheap engine and take chances on losing all it costs you.

Besides the highest quality of workmanship and material the Olds Engine has many special and exclusive features. Each one means a great deal to you.

1. Removable water jacket—may save you $100.00.
2. Seager Patent Mixer has not a moving part to wear or get out of order.
3. No gasoline pump of any kind to leak or be primed.
4. Cylinders and Pistons of special metal—ground to exact size.
5. Cylinder and head one piece—water cannot enter cylinder.
6. Safety Governor—positively prevents engine's running away.
7. Absolute guarantee—No REPAIR BILLS for the FIRST YEAR.

Tell me what you need an engine for and I will assist in selecting the proper size. Write the nearest office.

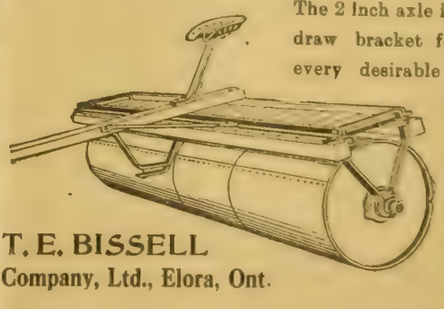
Drums Guaranteed not to Dent.

The "Bissell"

You'll find the "Bissell" an exceptionally strong, rigid and substantial roller. We guarantee the heavy steel drums not to dent or dinge. They will always do their work perfectly. You can enjoy riding on this roller, too. The position of the seat prevents jars and jolts. The horses will prefer to draw this roller. It runs easily. The "Bissell" has large Roller Bearings one-half inch in diameter and the axle revolves with the drums, therefore it is lighter draft than others. The frame is stiff and strong. The 2 inch axle is solid steel. There is a draw bracket for low hitch. You'll find every desirable feature on the "Bissell."



Dept. "M." will be glad to send you catalogue explaining detailed construction and showing different styles. Write us or see your local dealer.

seldom leaves them completely, Scaley feet is also very common in this class of stock gathered from everywhere, and a scaley-legged hen should never be used as a setter or a brood-hen, for she will invariably give this foul trouble to the whole brood, for it is easily transmissible, as the scale-mites will leave the feet of the mother hen for those of the growing chickens, and we have seen chickens a few months old infected with this disease and communicated to them by the mother hen.

It is useless to try to cure this disease at this time, for if the commonly used remedies such as ointment of one kind or another is used it will simply ruin the eggs for hatching by the hen smearing them with it, and though I know of a case where a person dipped the legs in common kerosene before sitting her. I hope that such a specimen of the breed of know little or nothing is rather rare.

Refuse absolutely to use a hen for a setter that shows any sign of scaley feet, for when the scales are even slightly rising from the leg the parasite is there and she will communicate it to the chickens.

Rations For Small Chicks.

In addition to commercial chick feed we like to feed a dry mash as supplementary food. A very satisfactory ration can be made by mixing equal parts by measure, of best wheat bran, corn meal, leaves sifted from cut clover, and fan wheat middlings. To each ten pounds of this mixture, add one-half pound fine ground best quality beef scrap. Be sure that scrap is pure gnd sweet. Cheap or poor scrap is dangerous to feed anh may cause losses. If you cannot be sure of the quality of the scrap, omit it from the ration and feed instead, two or three times a week, a little fresh beef scraped from sweet clean shin or chuck.

Keep a supply of grit, fine granulated raw bone (kiln dried), granulated charcoal and fresh water where the chicks can always have access to them. Keep dry mash always before them. In addition, feed chick food in litter of cut clover, feeding enough so that they will always be able to find a little by scratching for it.

For the first three weeks in addition to the chick food and dry mash give supplementary feedings af boiled cracked rice and wheat. These should be thoroughly cooked until soft, and almost dry, and should be lightly seasoned with salt. Allow the cooked food to cool before feeding and sprinkle with a little ground raw bone. Also give chunks of raw potato for the little birds to pick at and furnish green food like grass, grain sprouts, cut cabbage, etc., giving them a daily supply, all they will clean up readily from the time they are a few days old until they are grown.

Plenty of green food is necessary and heavy grain feeding cannot be sdccessfully conducted without it. Unless chicks have free range on a grass run, an abundance of fresh, succulent green food must be supplied.

We like to keep food before young chicks all the time. After they are three weeks old, they may be given the same rations used for laying fowls.

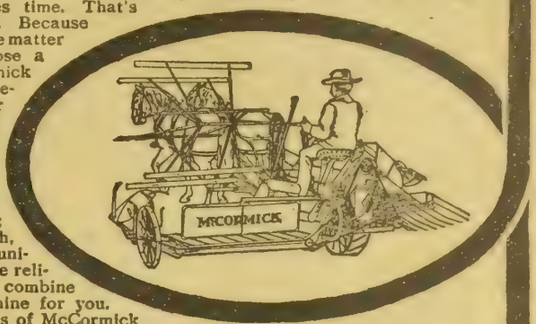
Keep the brooders and brood coops in clean and sanitary condition. Renew the litter material frequently. Either move the coops to new ground often or keep the ground sweet by frequent stirring or occasional sowing of oats.

Chicks can be successfully grown in limited quarters but under such conditions require very much more care. For best results in growing birds for laying or breeding stock, liberal range on a grass range is best.

START TODAY TO GET READY FOR HARVEST TIME

DON'T put it off any longer. From now on 'till harvest you are going to be busier every day. Your grain is likely to ripen all at once. Then you'll want to cut it quickly. You can't do it unless you are prepared with the best harvesting machines—in proper condition.

To be sure of getting the best machine for your needs—you must make a careful selection. That takes time. That's why we say start today. Because we know if you go into the matter carefully you will choose a McCormick. The McCormick Binder will meet your requirements as no other machine will. It is built to meet the conditions encountered on the Canadian farm. It has stood the test of years. Its capacity to handle grain that is tangled or down; its simplicity, strength, durability, light draft, uniform, good work and the reliable work of its knotter, combine to make it the best machine for you.



Other farm machines of McCormick make, a long line, are not less valuable than the Binder. The line includes: Harvesting Machines, Binder Twine, Mowers, Tedders, Hay Rakes and Side Delivery Rakes, Hay Loaders, Disk, Shoe and Hoe Drills, Cultivators and Seeders, Smoothing Spring Tooth and Disk Harrows, Land Rollers and Scuffiers. McCormick dealers also handle Gasoline Engines, Cream Separators, Hay Presses, Wagons, Sleighs and Manure Spreaders.

Every McCormick everywhere is recognized by farmers as a leader in its class. But we don't ask you to take our word for this. We say—Start today to investigate so you will have time to make a proper decision.

For catalogue and specific information on any McCormick machine, call on the local dealer or write direct to nearest branch house.

"ORANGE LILY SAVED MY LIFE"

These words or expressions having the same meaning are contained in hundreds of the letters I have received during the past year. Many were from women who had suffered agonies from falling of womb; others from women who had escaped dangerous surgical operations, as the tumors and ulcers had been removed by the action of Orange Lily; and others who had suffered from suppressed menstruation, leucorrhoea, painful periods, etc. For all these and the other troubles known in general as Women's Disorders, Orange Lily furnishes a positive scientific, never-failing cure. It is applied direct to the suffering organs, and its operation is certain and beneficial. As a trial actually proves its merit, I hereby offer to send, absolutely free, a box worth 35c., sufficient for ten days' treatment, to every suffering woman who will write for it. Enclose 3 stamps, MRS. FRANCES E. CURRAH, Windsor, Ont.

For Better Fruit.

At a meeting of the Kings County Farmers' Association, Mr. W. H. Woodworth, who has been through the county on a missionary campaign in the interests of better fruit, addressed a large audience in Victoria Hall, Berwick, on March 26, 1910. He began by saying:—

"This is a fruit grow ng district and our largest revenue comes from growing apples. This being the case we must put up better fruit by taking example from those who do, such as the orchardists of Hood River and British Columbia. The people in these districts take particular care that other people know where they live and advertise accordingly.

We do not advertise our Province enough; while we are raising inferior fruit, others are putting up extra high quality stuff. Mr. Woodworth advised young men who were about to set orchards, not to make the mistakes of the past but to do the same as the Westerner and plant thirty-three to forty feet apart, unless they put in fillers, but it takes a good deal of courage to take an axe and chop out these trees. Mr. Raluh Eaton, of Kentville, overcame this difficulty by transplanting twelve-year-olds; however, Mr. Woodworth said that he himself had not had any experience of this kind and he would not advise his audience until he knew more more about it.

In the past we have made the mistake of heading the trees too high where they were more liable to be rocked by the winds. When a tree has a low head it is more easily handled at the times of picking, spraying, pruning and thinning.

There is an orchard at Torbrook which Mr. Woodworth inspected which was headed seven feet high, and he told the owner that the land would be worth one hundred dollars an acre less because of the expense in handling, than in those orchards where the trees had low heads.

Orcharding in Nova Scotia is as yet in its infancy. There are thousands of people going West, and these will demand fruit in their markets. Last year five hundred carloads of perishable fruit went from Ontario into the West and they will need yet more. Good fruit is always in demand, we receive poor prices because we ship poor fruit.

Cultivation needs our attention; in Nova Scotia the sod orchard is a thing of the past. Now we must plow our orchards in the spring, or the fall, and keeu up a system of cultivation until about the 25th of June or the beginning of July when the trees will have finished their growth, then sow summer vetch as a cover crop.

The advance in orcharding owes much to institute meetings and to farm papers, from which many have learned the value of spraying. A mistake in the past is that many have not mixed the Bordeaux according to the directions given by the experimental farms. The applicances should be first-class and great care should be taken to mix the sprays properly.

Lime and sulphur spray, like the Bordeau may be applied in the dormant season, it kills spores and sucking insects. Before the first spraying the trees should be gone over with a scraper, taking off all loose bark, behind which will be found millions of oyster-shell bark lice. If these will kill a young tree, how injurious they must be to an old one!

Home made lime and sulphur can never be used as a summer spray, because an amateur cannot always get the strength in the same proportion, therefore there would be danger of burning the leaves.

Mr. Woodworth advises his audience not to rush into the lime and sulphur sprays before trying a series of experiments; one experiment does not prove much, and it is better to remain by Bordeaux while it is successful.

One of the latest diseases with which we have to deal is the fly-speck or sooty fungus, for which the apples should be sprayed when about the size of trancendental crabs or later. This fungus developes on the apples when they are mature, especially when they are stored in barrels, which naturally causes a heavy loss. Mr. Woodworth proved by experiment that the spot is on apparently clean apples, but developes later. He selected exhibition fruits and wrapped each one in paper, packing them in a box between layers of excelsior. When the fruit was unpacked it was badly affected by this disease, which proves that if we are to arrest it, we must spray the fruit late.

Last year the aphis were troublesome, but they should be sprayed with kerosene emulsion or whale oil soap before the leaves begin to curl, otherwise it will be difficult to get a contact emulsion to touch them. It is better to make one special spray for the aphis as internal poisons do not affect them; the caterpillars chew the leaves and take a dose of poison, but the aphis puncture the tissue and suck the juices of the plant. Professor Sears was quoted as saying that he would rather deal with the San Jose scale than the aphis.

With regard to harvesting the fruit, Mr. Woodworth said that we handle our apples too roughly; in one orchard not far from Berwick he was astonished to find a man who used a hook fastened to a pole, whereby he shook down the apples, and then hauled them to the warehouse! Every man should feel that there is a responsibility resting on him to his country in the way he markets his fruit.

Talking of thinning, ten barrels of (No. 3's) Number Three's, taken from a tree were not worth five barrels of Number One's. Seventy-five per cent. of the plant food in the ground goes to grow apple seeds, which in good and bad fruit are much alike so that we should consider the value of thinning; some people say that they cannot afford it, but nothing pays like thinning.

During the last season we sent eighty-five thousand barrels of Number Three apples to England, which, in several cases did not return the grower more than one cent on the barrel. It pays to export good fruit. Even in Nova Scotia choice apples are in demand at $2 or $3 a box. A man told Mr. Woodworth that he would rather pay a good price for a box and know what he was getting rather than buy a barrel with the trodble of sorting out a box of number ones from it.

Mr. Woodworth ended up his address in true patriotic spirit. Such an enthusiasm for the development of our country is infectious. If we can interest the young people enough to stay at home as agriculturists it will do more for the making of our country than anything else. (Does not the greatness of Canada depend on the plow-share and the pruning hook?)

Mr. Woodworth went on to say that we in the Annapolis Valley do not appreciate our luxuries, which are those of the millionaire. Our advantages are superior to those of the city. We have freedom, fresh air, independent water supplys, telephones and, rural mail deliveries, horses and so on, and when we count up all these things, the balance is on the side of the man in the country; besides this the people of the cities are not more intelligent than those of the country.

This is an age of progress; twenty years ago the speaker remembered farms which were only worth one thousand dollars, to-day they are worth five thousand. He remembered when the site of Berwick railway station was a forest, and when the Village consisted of but a few straggling houses, now buildings have gone up in every direction and trees were being planted in such quantities that the Annapolis Valley would soon be one vast orchard.

DEPT K HAMILTON, ONT., WINNIPEG, MAN.

Great Ayrshire Sale at "Glenhurst Farm," Williamstown, Ont.

Mr. James Benning, the proprietor of "Glenhurst," and in fact, Ayrshire breeders as a whole, are to be congratulated on the largest and most successful dispersion sale ever held in Canada on Wednesday, April 20th, last.

Eighty-one head were disposed of in one hour and fifty minutes by auctioneer Andrew Philps, of Huntingdon, Que., whose services were secured a few days previous, owing to the illness of Capt. Robson, who was to have conducted the sale. Never have we seen an auctioneer draw the bids nor hold the attention of the crowd as did Mr. Philps. It reminded one of the auction marts of Liverpool or Glasgow.

The "Glenhurst" herd of Ayrshires has long been noted for its quality. It was established over 40 years ago by the late David Benning, at whose decease some years ago the business was taken over by his son, James, who has followed out the same line of breeding as his father. Selecting a foundation stock of typical Ayrshire females, only the best sires have been used, combining quality and type with utility, thus there was maintained uniformity and superiority in the herd from the oldest to the youngest. To secure an Ayrshire, whether male or female, from the Benning herd, meant that it was a good animal. While the Bennings never followed the show ring very closely, yet they sent out many winners. Their herd became famous in this regard after the World's Columbian Exposition at Chicago in 1893, many of the top winners were from the Benning herd.

That 81 animals 16 of them being calves from two days to three weeks old, should bring nearly $12,000 an average of nearly $150.00 each, speaks much for the Benning's as stockmen. With the exception of the stock bull, Drogan Mains Guarantee (imp) (7317) —26337—these animals were all bred at "Glenhurst." Mr. Benning reserved all of the oldest cows and a few of the younger ones, in all about 15 head, so as to keep in the same line of breeding as he will build up another herd.

The sale was widely advertised and brought purchasers from far and near. Many went away disappointed at not being able to secure any, or possibly, only one or two animals. Among those from a distance were Gilbert McMillan, representing J. P. Graves, Spokane, Wash; P. Ryan, Browester, N. Y.; J. W. Ogdon, Morristown, N. Y.; W. L. McCormick and J. A. Stalter, Patalaska, Ohio; C. W. Short, Ogdensburg, N. Y.; N. E. Clarke, Potsdam, N. Y.; Prof. G. E. Day, Ontario Agricultural College, Guelph; Wm. Hunter, Maxville, (who purchased for a British Columbia firm); Alex. Hume, Menie, who also made purchases for G. H. Tretheway, Toronto; and A. W. McIntyre, Newington, who made selections for a western breeder. Ayrshire breeders were out in legion and the crowd numbered nearly 1000.

BARN ROOFING

The "Eastlake" Steel Shingle is the only absolutely weathertight shingle on the market. Let us tell you why. A shingle to be proof against the severest storms must have at least a ***three inch overlap.*** The

Eastlake Steel Shingle

is the only shingle that has that much. The so-called four-lock shingles have only an inch and a quarter overlap—not enough to keep out the drifting snow and rain, so this proves the "Eastlake" the only waterproof shingle.

The roofing problem solved. Our free booklet, "Eastlake Metallic Shingles," tells how.

"'Eastlake' shingles can be laid in one quarter the time it takes to lay a four-lock shingle."—The Philosopher of Metal Town.

LONG STANDING SCIATICA

Completely Cured by One Box of Father Morriscy's No. 7 Tablets.

Sciatica is hard enough to endure, and harder still to cure, in many cases, with ordinary remedies. Caused, like rheumatism, by impurities in the blood, which in this case set up an irritation of the sciatic nerve, it is so difficult to get at with external applications that many sufferers try in vain to get relief.

Mr. Charles McEachern, of Summerville, P.E.I., was in just that position until he started to take Fatner Morriscy's "No. 7." He writes:

"After trying several doctors and spending large sums of money without avail, I was completely cured of Sciatica of long standing after using one package or your Medicine (No. 7 for Rheumatism.)'

No matter how long you have suffered from Sciatica or Rheumatism of joints or muscles—no matter how much medicine or liniment you have used without result—try Father Morriscy's No. 7 before you give up. It has restored health to many who were almost hopeless.

50c. a box at your dealer's or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 85

A Windsor Lady's Appeal.

Patriotic Agriculture.

(Continued from page 342)

a house out there, a ten feet square shack will cost you five hundred dollars, and a very small house would cost a thousand. Then there are the frosts, the rains and the hail with which to contend—things which are not boomed.

The trouble with the people in the East is that they have too good a country which they do not appreciate because they get their living too easily.

People talk about the magnificient apples of Hood River, but the flavor cannot be compared with those grown in Nova Scotia. Mr McRae had paid 10 cents for a Western apple of fine color, a fruit which you would take in both hands, but when he tasted it he felt like the little boy who said "stung!" and longed for an Eastern Northern Spy

Once Mr. McRae suggested to a friend that he would visit the famous Okanagan Valley, but his friend replied "Don't do it, it will spoil your dream—better think of it as the real estate men picture it"

There are failures and insect pests in the West, and in competing in the markets of Britain their facilities are not so good as those in the East. Right now there is a crisis in our national life; prices have never been higher that at present. The city populations are increasing sixteen to seventeen per cent faster than those of the country, consequently the demand for country produce is on the increase. The 1908 supplies of the agricultural products of the world are practically used up. Labor is scarce and less efficient, with these conditions prices are bound to keep up, for we must now compete with the city man in the price we pay for labor.

Poor stuff goes to poor markets where it is a drag and pulls down the price of good stuff. We should take example from the California orange growers who would rather let poor oranges rot on the ground than send them to markets where they will pull down the price of good fruit.

Farmers must adopt the latest business methods; there are only a few farmers who are business-like, that is why in politics a farmer is put on one side. When political men wants the farmer's votes, they will come down to the country and tell them that the agriculturist is the back bone of the nation and so forth, but when they go back to the city their attitude changes.

The splendid isolation of the farmer must be done away with, he must have a business education and then go home and apply it in co-operation, for much money has been lost through jealousy.

Twenty years ago when there was no co-operation Denmark was a poor country, today it is one of the wealthiest countries in Europe. By co-operation they save the middleman's profit which goes back into the pockets of the producers.

In Denmark the people pull together, the result is, that there are no beggars and only a few wealthy people.

In the West the wheat growers combine so that the government and the railroads have to listen to them. If Nova Scotians would do the same, they would secure better rates for the produce which they wish to send West.

Co-operation would also help to solve the problem "How to keep the boy on the Farm" where he is much more independent than the lad in the city. The managers of our country do not realize the ability of the farmers, but if we would combine, they would respect us, and at last we shall come to our own.

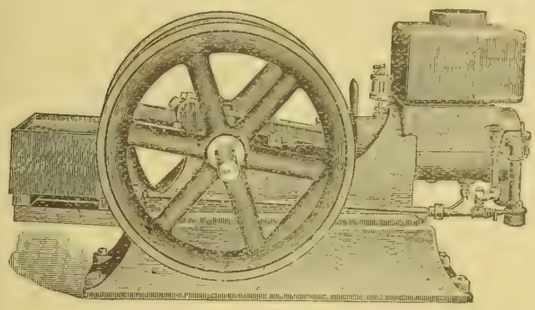
The mistake we make is, that we are not proud enough of our profession, for agriculture now is altogether a profession, and yet if there is a vacancy at Ottawa to whom do the honors go? To the farmer? No! Has a farmer ever been knighted in recognition of what he has done for agriculture? Yet in Sweden there is a man who has won one hundred and eighty-eight medals in agricultural pursuits and the King of Sweden has delighted to honor him.

EUNICE WATTS, A. R. H. S.

WE WANT AGENTS RIGHT AWAY!

In every section in the Maritime Provinces where a gasoline Stationary engine can be sold. The one we have to offer, which appeals most to farmers, is the

"Waterloo Boy"



Frost Proof Stationery Engine.

These Waterloo Engines are well and substantially constructed of the best material, by skilled mechanics, and are so durable that the makers have no hesitancy in extending to users their five years' guarantee. Engines are built on the interchangeable plan, all parts being made from jigs and templates, each and every part of the same kind being perfect duplicates, so in future years repairs that may be required can readily be placed without delay.

All the working parts are exposed to view and the duty of each part is readily understood by the user of the engine. The construction of these engines is such that they combine great strength and durability, yet it has been the manufacturers constant study to do away with all extra parts and simplify the construction as much as possible.

If you are looking for a good, reliable and up-to-date gasoline engine to handle—one which sells itself and leaves you a fair margin—write to-day for particulars.

J. R. OASTLER, Supt.

How Trees are Made Symmetrical.

The correction of the forked or defective crotch that is found to a great extend in our soft maples and elms and to a less degree in almost all our landscape trees forms a large part of the "tree surgeon's" work, says Cement Age, New York. This form of crotch usually has its origin in the destruction of the original head or leader. In a case of this kind a double head is formed by the forcing out of two lateral buds. As these shoot up, forming the new top, the old stump at their base gradually decays, allowing water to penetrate into the crotch. Nature tries desperately to heal this wound, but the imperfect joint is constantly forced open by the wind and prevented from uniting by the old stump, until finally, weakened by decay, the tree splits. Many of our finest trees are ruined every year by the splitting of these defective crotches.

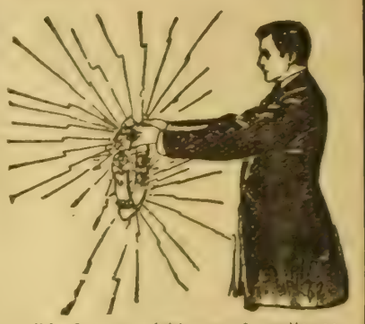
These cases are often exceedingly difficult to treat. The decayed matter must first be removed with great care and thoroughness—in fact, the dentist is not more conscientious in removing decay from a tooth than is the "tree surgeon" in cleaning out these cavities. The opening is then packed tightly with cement or a preparation of oakum, tar and paint. Cutting watersheds in these crotches often takes all the workmen's ingenuity and patience, for, working in the narrow limits of the fork, as he is compelled to do, it is exceedingly difficult to use his tools. But here most of all a perfect watershed is required, as the water running down the limbs and trunk would otherwise find lodgement behind the filling. In the case of a large tree the additional precaution is taken of putting a bolt directly through the crotch, while a chain is placed some twelve or fifteen feet up.

The old method of placing an iron band around a tree to prevent splitting often caused death, or at least deformity, for as the trunk or branch grew in circumference the stricture cut off the flow of sap, depriving the top of nourishment. The improved method consists in placing bolts directly through the limbs and securing them on one end by washers and nuts, while on the other a hook is formed, over which a chain is placed. This serves as a stay, enough play being given in the chain to allow the crown sufficient swing or way.

Fully half the cases of decay of the limbs or trunk were originally caused by improper pruning. Eight out of ten men in cutting off limbs will leave a stump projecting five or six inches. The bark along the circular edge deprived of nourishment dies back, leaving the face of the cut exposed. The unprotected cells cannot resist exposure, and decaying, leave the heart of the tree exposed to myraid enemies. In many trees the cavity caused by the decay of the heartwood is large enough for a man to stand upright in, the entire trouble having been originally caused by a cut of not over eight inches.

Every cut should be made as close as possible, in order that the sap raising through the cambium layer may cover the wound with new bark. Where large branches are to be removed the first cut should be made from below, so that as the branches fall there will be no tearing down of the sapwood or bark. The second cut is then made from above. In order to protect the exposed cells they are painted with a preparation of coal, tar and paint. Where the cut is soft or of unusual size a cap of zinc is fitted to the exact size of the cut just inside the bark and nailed tightly down to prevent moisture from reaching the exposed wood. The new layer of bark will eventually completely cover the zinc, leaving little or no scar.

Weak, Run Down, Worn-Out Men



Why will you be weak? Why do you go on from day to day when you know you are losing your nerve force—your manhood—when you see a cure within your grasp? Do not delay a matter which is the key to your future happiness. Whatever your condition to-day, you will not improve as you grow older. Age calls for greater vital force, and the older you get the more pronounced will be your weakness.

I have the grandest invention of the age for weak, run-down, worn-out men; the surest and easiest cure for all nervous and chronic diseases. Its wonderful power is directed to the seat of the nervous system, through which its vitalized strength penetrates into all parts of the body, carrying new life to every function which has been weakened by disease or dissipation, restoring energy to the brain and power to the system. No weak man will regret a fair trial of the invigorator.

DR. McLAUGHLIN'S ELECTRIC BELT

will make you strong. It will send the lifeblood dancing through your veins. You will feel the exhilarating spark warm your frame, the bright flash will come to your eye, and a firm grip to your hand, and you will be able to grasp your fellow-countryman and feel that what others are capable of doing is not impossible for you. This grand appliance has brought strength, ambition and happiness to thousands of men in the past year.

It is the one sure remedy for the cure of Rheumatism, Weak Back, Weak Kidneys, Weak Stomach, Varicocele, loss of power in young or old, and similar ailments as well as Dyspepsia, Constipation, etc. How can anyone remain in doubt as to the value of this grand remedy when you see so many cures by it?

To prove to you the confidence I have in the curative power of my Belt, I am willing to accept your case, and after I have cured you, then pay me. All I ask is reasonable security. You may then use my Belt at my risk, and

IF I DON'T CURE YOU MY BELT COMES BACK TO ME

You are out the time you spent on it—wearing it while you sleep—nothing more.

Nervousness---Sleeplessness---Run Down

Dear Sir,—One year ago last February I was taken with Nervous Exhaustion (the doctors pronounced it). I suffered all the tortures of that disease; was run down, so weak I could hardly do anything at all. Since I began to use your Belt there has been a marked improvement in my condition in the different ways mentioned. I have slept well every night since wearing your Belt, which is one of the greatest blessings of mankind. I have a great deal more ambition; work used to seem such a mountain now it seems more a pleasure; more strength and vim; memory better; digestion better; constipation about gone, with which I was bothered a great deal; head feels better, and I feel far better in every way. Yours truly,

NELSON ROSE, South Bay, Ont.

The Dr. McLaughlin Electric Belt is a cure for all signs of Breakdown in Men and Women. The Vitality of the body is Electricity—the force in the Nerve Cells. My Electric Belt will give you back this power and enable you to fight on in the Battle of Life!

Caught Cold By Working In Water.

A Distressing, Tickling Sensation In The Throat.

Mr. Albert MacPhee, Chignecto Mines, N.S., writes:—"In Oct., 1908, I caught cold by working in water, and had a very bad cough and that distressing, tickling sensation in my throat so I could not sleep at night, and my lungs were so very sore I had to give up work. Our doctor gave me medicine but it did me no good so I got a bottle of Dr. Wood's Norway Pine Syrup and by the time I had used two bottles I was entirely cured. I am always recommending it to my friends."

Dr. Wood's Norway Pine Syrup combines the potent healing virtues of the Norway pine tree with other absorbent, expectorant and soothing medicines of recognized worth, and is absolutely harmless, prompt and safe for the cure of Coughs, Colds, Bronchitis, Croup, Sore Throat, Pain or Tightness in the Chest, and all Throat and Lung Troubles.

Beware of imitations of Dr. Wood's Norway Pine Syrup. Ask for it and insist on getting what you ask for. It is put up in a yellow wrapper, three pine trees the trade mark, and the price 25 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

The Gasoline Engine for the Dairy Farmer.

If I owned a dairy farm I would certainly have a gasoline engine for operating my separator. I would have a milk house near enough to my residenc so it would be convenient to have an abundant supply of hot water for cleaning the separator and all dairy utensils. I would have a well in the milkhouse and operate the pump with the engine. I would also have a tank of cold water for caring for my cream. Some of you would think this would be a great expense, but I maintain that it would be a question of economy. I have a friend who has a one and one-half horse power gasoline engine that cost him, I believe, $140. This engine has been in constant use for six or seven years, with practically no expense. They have a herd of 20 Jersey cows and it cost him, on an average, 55 cents per month for skimming the milk twice a day from that herd of 20 cows, a little less than one cent each skimming. No man could skim that amount of milk by hand for that price, if he put any value on his time. Outside of the question of labor, you will get a more exhaustive skimming, as the separator is run at a uniform speed. In connection with this, if the inflow of milk is kept the same, you get cream of the same density from day to day, thus avoiding the annoyance of variation of tests, which is one of our most common complaints. This man says: "For running our separator alone, it takes five gallons of gasoline per month at 11 cents per gallon, to separate the milk from 20 cows. When we run the churn and washing machine it takes from 8 to 10 gallons per month. We saw wood, shell corn and run the grindstone when needed.

I have tested skimmed milk caught from the separator as it is separated on the farm under ordinary conditions, and I have found in some cases the fat in the skimmed milk to actually read over one per cent. It would not take a man who owned a large herd very long to waste enough fat to purchase a gasoline engine.—By Prof. McKay at Gathering of the Iowa State Dairy Association.

An Improvised Bath.

One of our exchanges tells as follows about how one farmer's wife improvised a bath in the house:

Few farm houses have a bathroom. Many farm houses have large kitchens; also large cisterns, plenty of soft water and a good kitchen range. Having these just as other women have them, one woman envolved one thing more. For ten dollars she bought a zinc bath tub, for which she found a place on one side of her kitchen. Her husband being handy with tools soon enclosed the bath tub in a frame made of matched ceiling. The tub was set about four inches from the wall and this four inches was made the base for a lid which could be let down over the bath tub, covering it completely so that it might easily have been mistaken for a large chest.

When the tub was set in place a lead pipe was fitted to the opening in the bottom, carried down through the floor and out to a drain beyond the outside wall. The lumber, the lead pipe together with the trap, the tub and the work of the tinner were the only expenses incurred. Woman-like she made sure no accident would befall by setting a large screw-eye in the wall and a hook in the lid, so that when the lid was lifted to allow the bath tub to be used it was hooked fast to the wall and was in no danger of falling. A little butter and-egg money did it all and not a week passes but the family blesses the hour when this bright idea dawned in the mind of a woman who had pluck to carry it out.

This Man is Young at 55 Years.

He is a "Health Belt Man;" therefore has the vitality and hot, red blood of youth in his veins; he towers like a giant above the ordinary difficulties of life—be a "Health Belt Man" yourself—it gives manly Strength; it makes you young and keeps you young all the days of your life; it takes all the coward out of your make-up--let me give you of this abundant vitality. then nothing can ever conquer you but death itself—100,000 men have taken my advice, why not you?

The secret of life long youth may be summoned up in one word—Vitality. If you have this great natural power in abundance years count for nothing. I use no drugs, I recommend none, Just the Health Belt. No privations, no dietiug and no restrictions, excepting that all dissipation must cease. Put the Health Belt on nights when you go to bed; let it send its power into your nerves, organs and blood while you are sleeping. It gives you a great flow of soft, gentle galvano-vital electricity during the entire night. One application and you are like a new being; it takes all the pain and weakness out of your back; it makes you answer the morning greeting with "I'm feeling fine." It is a great strength builder; it overcomes the results of earlier mistakes and indiscretions; gives you a compelling power, so that you are attractive to all women and men with whom you come in contact. Three months' use is sufficient. S. Coolen, Hubbards Cove, N. S., writes; "I am a man again, thanks to you. Nothing can discourage me now." This is one among tens of thousands.

Free Until Cured Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

These Nature Cure Books FREE

FLORICULTURE.

All inquiries in this department will be answered by H. E. Goold, Florist, Sussex, N B

Writer says:—I have an Azalia which was purchased from a hot house some time ago finished blooming, should it be put in the cellar for the summer, or left in the light, and when should it be repotted for next winter? If at all. I am informed that it is the prey of many insects if so, what treatment should I follow? Is there any food which is good for carnations? My Mrs. Lawson carnation, which has had several blooms through the winter, seems to need removing as each bloom is smaller than the last. Also is ammonia good for plants?

ANS.—Keep the Azatia in the window until all danger of frost is over when it should be repotted and the pot plunged in the ground in a spot which would be convenient to water it. Put a little gravel or stone under the pot so that craniage may be good. If required in a compact bushy shape, prun to size required but never cut the plant after the 1st of August. The Azalia is commonly infested with the scale insect and mealy bug, for which use kerosene emulsion, either wash or spray, directions for the preparations of which have been so frequently given in this column. The under side of foliage should be sprayed occasionally (say once a week) after the plant has been brought into the house in the fall to keep down the red spider, while out of doors they need little attention if cleared before planting out.

I do not know of any special food for Carnations. Use liquid cow manure once a week or repot the plant into two sizes larger pot and use rich soil.

I do not like ammonia for a plant food however, it is commonly used. I regret that having never used it I cannot give the quantity required. Bone meal is an excellent fertilizer for carnations and a lasting one.

A. L G. writes asking what causes leaves of Palms to dry and sends samples, saying that Palm has been sponged once a week, gets plenty of light, is only watered once a week and was repotted in the fall.

ANS.—The fall is the worse time to repot Palms it would likely injure it. I should also think it should be watered oftener than once a week and if sponged every other day, for say a fortnight, it would be likely to help it.

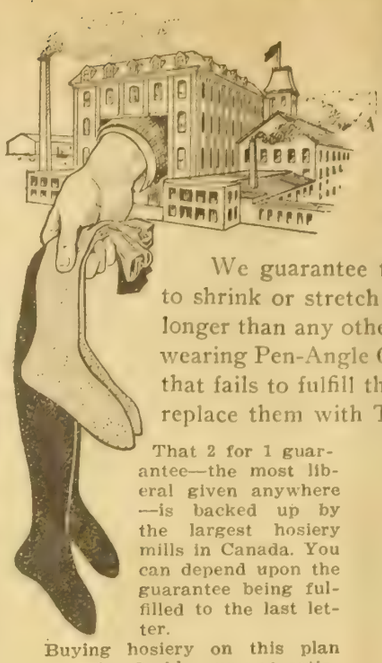
Many plant growers complain that their plants grow spindly even if in the bright sunny window. The trouble is that the curtains are down at the top shutting off the top light that they crave even more than the sun from the side angle. The Premular Obcenica is the plant for spring and summer blooming, this is the largest flowering plant under all conditions that can be obtained and the most generally satisfactory. It has a range of color from white to deep lavender almost purple

QUES.—The leaf of what is commonly called Strawberry Geranium, what is its care, and how can it be grown from seeds or slips?

ANS.—The Strawberry Geranium (Sacifrage Sarmintosa) requires exactly the same treatment as any other Geranium, sunshine, water, good drainage. It is projiagated by putting small pots of moistened soil under the tips of the runners. As soon as these little runner tips have taken roots cut the runners close to the plant and you have your separate plant.

A FARMER reader at Lower Newcastle, N. B., wishes to know what to do with Chrycanthemum when done blooming?

ANS.—This plant exhausts its vitality in blooming and should be cut down to the pot and roots put away in a dark cool place, until February, keeping it on the dry side, then bring to light and water and root sprouts will come up from which when a few inches high take cutting and root them in moist sandy soil. These cuttings will give you good blooming plants next autumn but must be kept growing without check



Buy Hosiery Made by the Largest Mills on a 2-for-1 Guarantee

We guarantee the following lines of Pen-Angle Hosiery to fit you perfectly, not to shrink or stretch and the dyes to be absolutely fast. We guarantee them to wear longer than any other cashmere or cotton hosiery sold at the same prices. If, after wearing Pen-Angle Guaranteed Hosiery any length of time, you should ever find a pair that fails to fulfill this guarantee in any particular, return the same to us and we will replace them with TWO new pairs free of charge.

That 2 for 1 guarantee—the most liberal given anywhere—is backed up by the largest hosiery mills in Canada. You can depend upon the guarantee being fulfilled to the last letter.

Buying hosiery on this plan you make doubly sure of satisfaction, for if the hosiery does not fulfill the guarantee the makers have to pay a double penalty.

But after you've worn a pair of Pen-Angle Hosiery you'll understand why we give this 2 for 1 guarantee, for you will have discovered your ideal hosiery—form-knitted, seamless, longest-wearing.

The reason for Pen-Angle superiority is due to the exceptional quality of the cashmere and cotton yarns we use. And because we knit them on Penmans' exclusive machines. We have the sole rights to use these machines in Canada.

Seamless Hosiery

These machines form-knit the hosiery to fit the form of the leg, ankle and foot perfectly, without a single seam anywhere to irritate the feet or rip apart.

They reinforce the feet, heels and toes—the places that get the hardest usage—without you ever being aware of any extra thickness.

Don't be content another day with hosiery which has those horrid seams up the leg and across the foot—with hosiery less serviceable—but get Pen-Angle 2 for 1 guaranteed hosiery

For Ladies

No. 1760.—"Lady Fair" Black Cashmere hose. Medium weight. Made of fine, soft cashmere yarns. 2-ply leg, 5-ply foot, heel, toe and high splice, giving them strength where strength is needed. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1020.—Same quality as 1760, but heavier weight. Black only. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1150.—Very fine Cashmere hose. Medium weight. 2-ply leg. 4-ply foot, heel and toe. Black, light and dark tan, leather, champagne, myrtle, pearl gray, oxblood, helio, cardinal. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1720.—Fine quality Cotton hose. Made of 2-ply Egyptian yarn, with 3-ply heels and toes. Black, light and dark tan, champagne, myrtle, pearl gray, oxblood, helio, sky, pink, bisque. Box of 4 pairs, $1.00; 6 pairs, $1.50.

No. 1175.—Mercerized. Same colors as 1720. Box of 3 pairs, $1.00; 6 pairs, $2.00.

For Men

No. 2404.—Medium weight Cashmere half-hose. Made of 2-ply Botany yarn with our special "Everlast" heels and toes, which add to its wearing qualities, while the hosiery still remains soft and comfortable. Black, light and dark tan, leather, champagne, navy, myrtle, pearl gray, slate, oxblood, helio, cadet blue and bisque. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 500.—"Black Knight." Winter weight black Cashmere half-hose. 5-ply body, spun from pure Australian wool. 9-ply silk splicing in heels and toes. Soft, comfortable, and a wonder to resist wear. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1090.—Cashmere half-hose. Same quality as 500, but lighter weight. Black only. Box of 3 pairs, $1.00; 6 pairs, $2.00.

No. 330. — "Everlast" Cotton Socks. Medium weight. Made from four-ply long staple combed Egyptian cotton yarn, with six-ply heels and toes. Soft in finish and very comfortable to the feet. A winner. Black, light and dark tan. Put up in boxes. Box of 3 pairs, $1.00; 6 pairs, $2.00.

Instructions

If your dealer cannot supply you, state number, size and color of hosiery desired, and enclose price, and we will fill your order postpaid. If not sure of size of hosiery, send size of shoe worn. Remember, we will fill no order for less than one box and only one size in a box.

Catalog Free

If you want something different than the styles and shades listed, send for handsome free catalog which shows an extensive line in colors. 45

Penmans, Limited, Dept. 45 Paris, Canada

Pen-Angle Hosiery

WARRANTED HIGH GRADE PENMANS HOSIERY

Put Any Weight on a Maritime Fence

and it stands the test. Man or beast can't break it down. Maritime Fence never sags or gets out of shape. Made from extra heavy imported hard drawn steel wire, thicker, stronger and galvanized so it is peel-proof. It is the last word in strength and durability.

The staying quality of Maritime fence is in the simple lock with the bull dog grip. It never lets go—never lets the fence get crooked. Maritime Fence is always sightly; always straight—always best. The quality of material and construction makes it best.

Don't buy fence until we have put our catalog and price list into your hands, postpaid, by mail. Costs you nothing to find out all you want to know about wire fence. Get your pen now and write on a postal "Send the catalog." 9

from start to finish to give good bloom.

QUES.—Another reader wishes to know when stimulants or plant food should be given plants?

ANS —I have answered this several times but will again give my opinion. No plant in pots or boxes should be given food or stimulants until the ball of soil is crowded with roots and nearly exhausted of food. To feed a plant, when it has already sufficient food, is to invite disease. At this season of the year, dark weather and short days, no stimulants should be given except in cases of some strong rank growing plant, that is wholly root bound. Better wait until the February sun gives light enough to enable the plants to assimilate more food and in watering plants during the dark period, it is also better to keep on the dry side, unless your plants are kept in a high temperature. If you have a plant crowded with roots that needs moving and it is not convenient to repot it into a larger pot, wash (not shake) all the soil of the roots and repot with fresh soil into the same or a smaller pot.

As soon as your forcing bulbs are thoroughly rooted and ready to bring to the light, see that the drainage is perfect in each pot or box, as if it is stopped they will rot if kept moist as they should be into full bloom.

Keep them cool during forceing; a high temperature gives poor bloom. Give all the air you can to all your plants.

In answer to FARMER reader of Hampton, Dalhias can be wintered in any position in which potatoes will keep well. Keep in a cool, dry, position free from frost.

If you have covered your tubers with earth in a cool position free from moisture they will keep all right but will start to grow early in the spring. If moisture can reach them in the soil they may rot. Look at them and care for them now.

Roses grown in houses in winter need air and all the sun you can give them and good drainage. Spray or wash the foliage every sunny day to guard against red spider and never let them wholly dry out. When in active growth keep moist but do not let water stand under the pots in saucers. This last applies to all plants not acquatics.

In answer to Oban, C. B., the insect on your Chrysanthum is the Aphis. Make a large paper cone place over plant, cut a few ounces of tobacco fine, moisten it and burn on coals held so that the smoke will go under the cone, this will kill them. Or make a strong tea of the tobacco and dip your plant in or spray it on the plant repeatedly.

The Cheerful Man.

The cheerful man is pre-eminently a useful man.

The cheerful man sees that everywhere the good outbalances the bad, and that every evil has its compensating balm.

A habit of cheerfulness enables one to transmute apparent misfortunes into real blessings.

He who has formed a habit of looking at the bright, happy side of things has a great advantage over the chronic dyspeptic who sees no good in anything.

The cheerful man's thought sculptures his face into beauty and touches his manner with grace.

It was Lincoln's cheerfulness and sense of humor that enabled him to stand under the terrible load of the Civil War.—Ex.

They're Safe From "Flying Sparks" When Protected With

Brantford Roofing

Read the letter of the Trenton Cooperage Mills. Learn how the buildings covered with Brantford Roofing were saved from fire. Certainly Brantford Roofing was given a severe test at this fire.

Here is another proof of the fire-resistant qualities of Brantford Roofing: Along with slate and iron, Brantford Roofing is accepted by the City Architect and Chief of the Fire Department for use in the most congested district in Toronto. We have a certificate to that effect. Do you know of any other ready roofing that has such a certificate? We think not.

The Toronto officials recognize a real fire-resistant roofing when they find one. So do the fire insurance companies. They will give you lower rates for buildings covered with Brantford Roofing. This is a consideration worth thinking about when buying roofing material.

You can put Brantford Roofing on your home or barn or any other building and feel sure that it has a fire-proof roof. You can erect the building right beside the railway track. "Flying sparks" are no menace to a roof protected with Brantford Roofing.

You have your choice of three different finishes of Brantford Roofing. ASPHALT has a silicia sand finish. RUBBER has a smooth, rubbery surface, but contains no "India Rubber." CRYSTAL has a mineral surface of rock crystals. Brantford Asphalt and Rubber are made in three weights. Brantford Crystal in heavy weight only.

You cannot always judge the quality of a roofing by its price. Lower-grade roofings are often sold at about the same price as Brantford Roofing. So make sure you select Brantford Roofing.

Get our big Roofing Book. It tells why we are making Brantford Roofing higher in quality than any other ready roofing you can procure today. We believe you will appreciate these reasons. They stand for lasting service. Send your postcard for this book by next mail. We will send roofing samples, too, if you'll just ask us. 24

TRENTON COOPERAGE MILLS, Limited

MANUFACTURERS OF

HOOPS, HEADING, STAVES

Trenton, Ont., Oct. 28 Brantford Roofing Co. Limited,

RECEIVED OCT 30 1909 ANSWERED OCT 30 1909

Messrs. The Brantford Roofing Co.,

BRANTFORD, ONT.

Gentlemen,-

We have much pleasure in telling you frankly, that your Brantford Roofing, proved in our recent fire to be practically fire-proof.

The buildings that surrounded the burned barrel Factory, were covered with your one ply Roofing, and stood the intense heat, and shower of cinders, blowing directly on them by a very strong wind, splendidly, and saved the sheds from catching.

We might say, that no water was used on these sheds, and if your Roofing had not been fire-proof, they certainly would have burned.

We assure you, that you do not exaggerate the quality of your goods, and Brantford Roofing, has been to us, all you claimed for it.

WAS.

Yours faithfully,
TRENTON COOPERAGE MILLS LIMITED

There's a satisfaction in a perfectly painted house similar to when one's body is protected by good stout clothing, rain-coat, top-coat and sturdy boots.

The protection afforded property after the paint coating is worn down to the bare wood is no greater than garments worn down to the lining.

Martin-Senour Paint

100% Pure

protects your property so that it emerges from winter as hardy, rugged and strong as it entered. Quality does it. It withstands the rigors of winter storms, tempests, rapid changes of temperature, humidity and the disintegrating effects of sun, wind, cold, rain, hail and snow. Everything that *counts* is put *in*—Everything *that doesn't is left out*. That's why the quality lasts.

If your dealer cannot supply you, notify us and we will gladly direct you to where our paints are to be had.

HOME SEEKERS—The Grand Trunk Railway are planning excursions to the Canadian North West These have been christened Home Seekers' Excursions and bring to mind the thought that there are thousands of new homes yet to be found in this ever-growing country-particularly along the line of the Grand Trunk Pacific. The Grand Trunk Pacific has acquired sufficient land to make nearly 100 town sites between Winnipeg and Edmonton. The lots are now placed on the market for sale, and are being rapidly picked up. Since last September between Winnipeg and Edmonton, the G. T. P. have been operating passengers and freight service. This is a distance of 703 miles, and all along the line there are villages and towns springing up with surprising activity There are four or five divisional points within this mileage that are showing marked development, and would well engage the special attention of those seeking a home or an improvement of their financial conditions. These excursions will be run on April 5th, 19th, May 3, 17, 31, June 14, 28, July 12, 26, August 9, 23, September 6, 20. Good for return within two months of date of issue. Other and full particulars may be obtained on application to J. Quinlan, District Passenger Agent, Montreal, or any other G. T. Representative

FARMING, RANCHING AND SOCIAL CONDITIONS IN WESTERN CANADA.—The Grand Trunk Pacific Railway have just issued a new and interesting publication, entitled "Farming, Ranching and Social Conditions in Western Canada" This publication contains a series of articles written by practical men on subjects of interest to those looking to better their present condition. The authors of the articles appearing in this book are such men as Mr Chauncey P Reynolds, editor of "The Prairie Farmer" Chicago and Fell llow at Michigan Agricultural College, Professor Thomas Shaw, Member of the Faculty of the Minnesota Experimental Station and Agricultural College, Mr. Phillip Eastman editor of the Capper publications, comprising a number of Kansas farming papers, Mr. R. S. Bayard, editor of the "National Stockman and Farmer", Pittsburg, Pen., and authority on beef and dairy cattle, Mr. Herbert Quick, editor "Farm and Fireside" Springfield, Ohio., and well known as an author and lecturer. Professor E E. Eaville, formerly professor of Agricultural Department, Iowa State College, Ames, Iowa These articles are written in an unbiased vein and from personal experiences and are most interesting to those who are desirous of learning more of Western Canada Copies may be secured on application to the General Advertising Department, Grand Trunk Pacific Railway Montreal

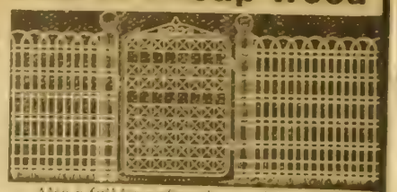
HORSES' SKINS ARE TENDER IN THE EARLY SPRING.—Every successful farmer knows how highly important it is to have all of his work horses in working condition every day during spring and summer, the time when he needs them most. A difficult thing to do, it is admitted. In the early spring horses' skins blister and gall easily and badly; during the winter months they have become tender. In the summer, when the weather is aggravatingly hot and insects are bad their skins are apt to scald and chafe and become bitten. Owing to these conditions many an otherwise good horse is laid up when his services are most needed—most valuable. To provide against just such occurrences the foremost farmers of the country have discovered and provided themselves with the only sure-safe, quick remedy. Bickmore's Gall Cure Invaluable and convenient, it cures while the horse works Satisfactory—the hair grows in again of the original color. For quickly healing cows' sore, chafed or fly-bitten teats it certainly has no equal. Ninety thousand horsemen and dairymen who use it and keep it in their stables the year round, admit that for surface sores of horses, cattle and all other stock no other cure is so sure, so safe, so quick and so satisfactory. Try it for harness or saddle galls, chafe, rope burns, cuts, scratches, grease heel, etc. Absolutely guaranteed to heal or money cheerfully refunded by your dealer. Thousands of dealers sell Bickmore's Gall Cure. Ask yours for it or send 6c. postage for free sample box, and Bickmore's Horse Book—it's free, too. A practical, valuable horse book, every horse owner should have. Address Wingate Chemical Co., Ltd., Canadian Distributors, 801 Notre Dame St., W., Montreal, Canada.

MODERN METHODS FOLLOWED BY POTATO GROWERS ARE VERY PROFITABLE.—Some of the readers of this paper would be astonished if they knew how much money some potato growers are making by following modern methods of potato culture. Time and again up-to-date potato growers have demonstrated that a Potato Planter, as well as a Sprayer or Sorter, will pay for itself in a single season, and without using a large acreage either An interesting and valuable work on "Potato Culture" is issued by the Aspinwall Manufacturing Company. It is written by their President Mr. L. A. Aspinwall, who has devoted his entire life to the study of potato culture and the manufacture of implements for the economical handling of the crop. This work covers every point of profitable potato culture, and includes articles on preparation of soil, selection of seed, how deep to plant, distance apart to plant, harvesting the crop, profits per acre. This paper has arranged with the Aspinwall Manufacturing Company to supply the readers of this paper with free copies of Mr. Aspinwall's work. If you desire a copy, write either to their factory at Guelph, Ontario, or to their home office at Jackson, Mich., and mention the name of this paper, and a copy will be mailed you promptly. This company has also just perfected Broadcast and Orchard Attachments for their Four Row Sprayers, which will render these machines especially desirable to the general farmer. If you request it this company will be glad to mail you their catalogue along with Mr. Aspinwall's work on "Potato Culture."

...s handsome as the best iron fence at less than the cost of cheap wood

Here's a neat, strong, durable fence that will add to the appearance of the handsomest city lawn and is cheap enough, close enough and strong enough for the farm. The

Peerless Lawn Fence



is made of heavy No. 9 steel spring wire, so it can never sag. It is carefully galvanized and coated with white enamel paint. No investment you can make will add so much to the appearance of your property.

Also a full line of poultry and farm fences and gates. Write for particulars.

The Use and Abuse of Lime in Agriculture.

"Lime and lime without manure
Makes both farm and farmer poor."

IN lime the farmer may find a most powerful agent for increasing the fertility of his lands. Indeed, some soils will do nothing without it. But on the other hand, if it be unwisely used, it may do almost irremediable harm.

Opinions and practice among practical men in regard to the use of lime vary very much. In some regions it is never used, while in others applications are made varying from sixteen cwt. up to two and even eight tons per acre.

Why this state of affairs should exist may be explained by a consideration of the many important parts which lime may play in the soil, and such a study will furnish guiding principles for individual practice.

Lime has very pronounced effects upon the physical condition of a soil. It cements grains of sand together by means of a porous cement and thus improves the texture and the waterholding powers of sandy soils. It corrodes the grains and thus makes the soil more finely grained. As the soil becomes finer in grain the surface exposed to the various solvents in the soil becomes greater at a very rapid rate, and thus plant foods are liberated more freely. In sandy soils lime will form capillary tubes running from the deeper portions of the soil up to the surface. This is a condition calling for more frequent cultivation, for unless these irregular tubes are broken off below the surface by hoe or harrow, water will feed up to the surface and evaporate, thereby cooling the surface and depleting the water supply. While if cultivation is thorough, the water saved will be supplied plentifully from the soil and sub-soil to the crop roots. Applied to clayey soils lime causes the excessively small particles to mass together in little balls, making the land more friable, more porous to air and water and warmer agriculturally. This "flocculation" of the soil particles increases the water and air holding power of the soil and the rate at which, under cultivation and drainage, the water and air may be renewed. One effect of this flocculation may be easily demonstrated. If two glass tumblers are filled with water in which some clay has been stirred, and if to one of these tumblers a few drops of lime water are added, the latter will settle in a few minutes, while the other may require a day or more to become clear. This effect of lime may be seen also in the soil's power by drainage. Through a tube fifteen centimetres long, filled with limed clay, water passed in one hour. Through a similar cylinder not limed it required two days for the same amount to pass. Limed clay will not puddle so easily as unlimed. In both clays and sands the lime flocculates much of the organic matters which may be present and unites with others, with the result that they do not drain out of the soil. If in limed and unlimed cylinders brown manure water be poured it will issue almost unchanged from the unlimed cylinder, but will be nearly clear after filtering through the other. What a difference this would make on an acre of land in the amount of manurial waste from a soil well limed compared with a soil lime-free, can easily be guessed. Lime therefore tends to make soils mellower, moister, more easily tilled and less wasteful.

A simple test for lime in a soil can be made by pouring on it some (muriatic acid (HCl) reduced to one-half the strength of the concentrated acid, and the amount of the frothing will roughly indicate the amount of lime present. The rate of settling and the power to retain manurial matters will also help to indicate whether the soil needs lime or not. If the soil, when moistened, shows acidity when touched with blue litmus paper (obtainable at any druggist's) by turning it red, it has been demonstrated that the soil needs lime, if the finest agricultural results are to be reached.

On the chemical condition of the soil the effects are as marked and as important as on the physical. It counteracts the acids, and so sweetens the soils. It sets free potash from the hard silicates of the soil grains, and this breaking down of the soil grains exposes the phosphates to the solvent activities of the soil water. If hurtful sulphates, such as Epsom salts and copperas (FeSO4), are present, it changes them to land plaster (CaSO4), and liberates the bases, such as soda and potash. It sets free the iron from the copperas, and helps it to oxidize to the helpful red rust. The lime quckens the rate of oxidation of iron and organic matter, and this adds to the warmth of the soil. By this action carbonic acid gas is produced, and this gas in solution has a pronounced solvent action upon the constituent particles of the soil.

The effects of lime upon the life of the soil is the chief matter of interest to a farmer, and is the result of the changes this powerful agent makes in the physical and chemical conditions. In fertilesoils there are the many varieties of bacteria which feed upon or produce various compounds in the soil, such as the iron and the sulphur bacteria which can feed upon the nitrogen of the air and the ammonia of manures, and change them into nitrous acid and the nitrates, and the nitric bacteria which adds more oxygen and change the nitrous acid to nitric acid and the nitrates. When the nitrate has been produced, we have nitrogenous food in the only form in which plants can make use of it, and which they must have if they are to grow. It will be seen therefore that the plant world depends for its food upon the bacterial world, just as the animal world depends on the plant world. One more class of bacteria should be mentioned, the dentrifying bacteria, the farmer's great enemies, which tend, in the lack of air, through poor cultivation and drainage, to undo the invaluable work of those just mentioned, in reducing the nitrates to ammonia and free nitrogen. They are doing their wasteful work when a manure pile is found giving off odors of ammonia.

Each kind of bacteria, like other forms of life, are killed by their own products, and therefore the acccumulation of nitric acid and other acids in the soil checks the important work of the nitrous and nitric bacteria. Lime will unite with these acids and counteract their effects. The bacteria then resume their activity.

It has been found that our leguminous or podded plants, such as clover, peas, beans, vetches, etc., are dependent in a very intimate way upon the bacteria. These are found in the nodules on their roots. By means of this association with the bacteria, this class of plants are able to build exceptionally large amounts of nitrogenous matter into their structure. They are also rich in potash. On account of this nitrogen richness, the clovers, etc., have become the hope of agriculture, for the world's supply of nitrates is running low. But the farmer who can so arrange his rotations of crops that once in four or five years he shall be able to plow under a mat of clover eight inches high, which in this climate he can get as an aftermath, will not lack nitrates enough for bumper crops. In sour and limeless soils his clover will not grow. The reason, therefore, is plain why lime, gypsum, basic slag (40 per cent. lime) and potash have so great a power to produce fine stands of clover. Sometimes on the other hand, the plowing under green crops may in their decay produce acid conditions even in well-drained and thoroughly cultivated soils which lime will correct. When however, the acidity has been corrected, the rate of decay, the rate of nitrification, the bacterial population of the soil and the warmth will all show an increase. Lime in a compost, will, for the same reasons, hasten its decay and ensure its more thorough nitrification and, therefore, its power to stimulate the growth of crops.

The conditions favorable to nitrification, on which all agriculture depends, especially if first class results are to be obtained, are moisture, humus, air, darkness, and lime or other alkali. Lime, therefore, is one essential in a set of conditions of which cultivation, drainage, and the plowing under of green crops, or the application of barnyard manure, can supply the rest. When clovers are plowed under, besides the large amount of nitrogenous matter they contain, if the stand is in its second year, the roots have penetrated to the subsoil, from which they have brought up notable quantities of potash and phosphate. These essential fertilizing elements are by plowing added to the available supply in the soil, where they nourish the bacterial life, and thus the succeeding crop to which they give healthy growth, stoutness and bulk, while the nitrogenous matters produce rapidity of growth and rankness.

Commonly we say that lime is not a fertilizer, but an ameliorant, that is, a substance which produces in the soil conditions favorable to the action of the phosphates and potash, and therefore to the growth of the plants. It must not be thought, however, that lime plays no part in the tissues of the plants. It helps the movement of sap. It counteracts some acids formed in the tissues which are poisonous to the plants. Without lime and iron the green matter of the leaves cannot be formed. In the cells, which are the only living part of plants, lime is found in the nucleus. When ripening begins lime retreats from the seeds to the leaves, while the phosphates go in the other direction. Science will probably have more to say in the future of the role which lime, iron and magnesia play in the growth, but through as fertilizers they are important and essential, their functions are very subordinate when compared with those of potash, the phosphates and nitrates. Besides, with exceptions of the lime, ordinary soils contain a sufficient quantity of these elements. It is well, too, when men can produce the surprising results possible through the use of lime, to remind them of the somewhat subordinate place lime occupies as a plant food.

Lime applied to soil kills out grubs, fungi, and all growths which swarm on sour soils. Sorrels and mosses go, and clover and the finer

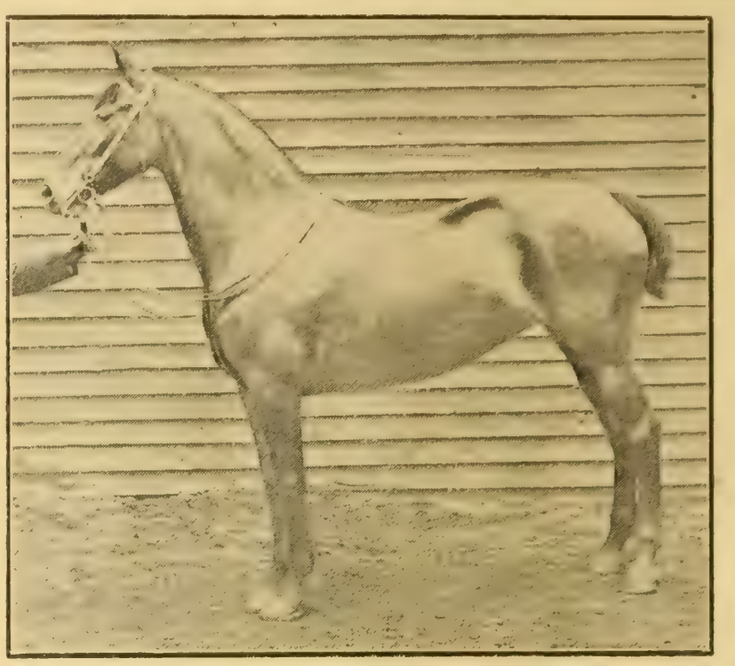
grasses come in. A dressing of lime, applied early in the spring, and harrowed in, has a very marked effect in checking the cut worm. The mature worm will crawl through lime, but when immature it has not the protection of the thick skin in which he rejoices when full grown. Club root in turnips and cabbages is markedly checked by the use of lime. The writer had one experience which may be of value to some others. Some cabbage plants were taken from a garden, in which club root was common to a new garden. In midsummer, one after another of the cabbage began to wilt down when the sun was hot, and there was little hope of saving any. A mixture of iron filings from the foundry and lime thrown on the surface of the soil close to the plants was tried, with the result that the spread of the disease was checked, and only four heads in a hundred were lost. When the cabbages were harvested they were of good size and quality, but not one was found which had not through disease, lost its main root, and near the surface, under the iron and lime were mats of fine roots, which had carried the crop through.

Some plants are especially benefitted by the use of lime. Apple trees, and cedars, and oaks are lime-loving trees. Clovers, sugar beets, and mangolds, tomatoes, lettuce and wheat respond well to applications of lime. It will benefit potatoes, but unfortunately, the scab, which thrives in alkaline conditions is also favored. A thick, green sod, plowed under, or a good application of black muck, will furnish acid enough to discourage the growth of the scab.

Very valuable composts may be made of clay, green sods, waste hays, grasses, and weeds, with the addition of lime. Tansy, ferns, and brakes, sedge, and cat tail are all rich in potash, and if easily obtained, are valuable constituents of a compost. With some provision for ventilation (to prevent denitrification) by forking over or by laying a few drain tiles or brush into the centre of the mass, the ripening of the compost will be very rapid. The result will be a mass rich in humus and nitrates, and potash from the clay and the air and the green growths. If basic slag phosphate be added, it will be rendered soluble, and the mass will form a complete manure of finest quality. Generally, however, a man's fields should be his composts.

Mulches made of cheap hays and grasses and weeds supply all the conditions for rapid formation of nitrates, viz., air, shade, moisture, organic matter and mineral salts. If lime be added the process becomes more rapid and at the same time slugs and field mice are driven away. For apples and raspberries and other fruits this is all the fertilizer required for potash, lime, phosphate and a good supply of nitrates will be supplied. The mulch will prevent grass from growing close to trees and will retain the moisture of the soil.

Experiments conducted by the writer show the effect of lime on a piece of worn out tidal marsh land, which had not been tided for 150 years and had yielded no good crop for many years. Some of the land grew weeds, short brown top and hard hacks, and the rest was blue mud growing a poor quality of broad leaf hay. Three casks of lime, 100 lbs. of muriate of potash, and 400 lbs. of basic slag phosphate were applied per acre. On the adjoining section of land was sown without any fertilizer. All the land had just been underdrained. The oats yielded 94 bushels on two acres, while 70 bushels was harvested from the neighboring plot, which was sown a week earlier and which lies nearer the creek. The surprising difference in the oat crop was hardly as marked as the difference between the clovers and timothy on the fertilized area and the non-fertilized plots. In the latter they are scarce, about two inches high, while on the fertilized strip they are abundant, six, seven and eight inches high. In some places the timothy was found in



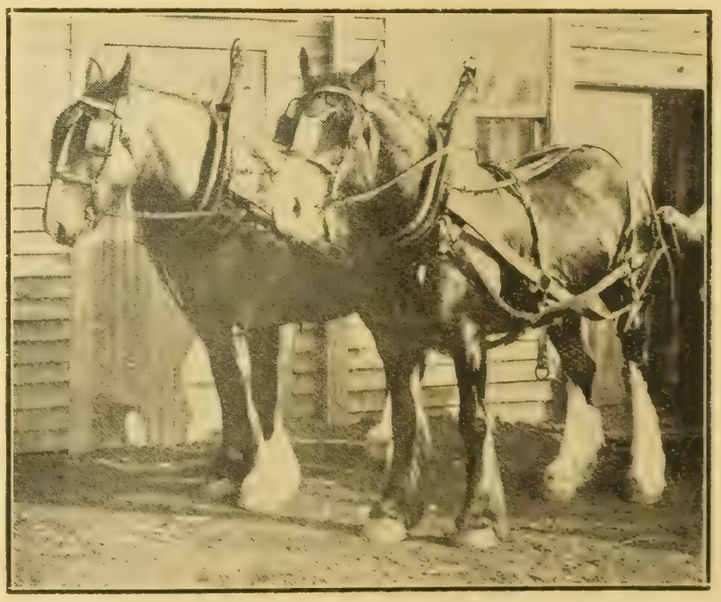
Banker.

One of Mr. McAvitys high stepping prize winners at the Maritime Horse Show.

head. This was a soil in which the use of fertilizers without lime would have had scarcely any effect, so sodden, sour and poisonous was the soil. With lime at $1.50 per cask, nitrate of Potash (KCl.) at $50, per ton, and basic slag at $19.00 per ton, the cost of application may be easily calculated, and it may be regarded as a fair amount to add to grass lands. The addition of nitrates would stimulate more rapid growth, but would add considerably to the cost and would tend to injuriously affect the growth of the clovers. The elements included above may be counted on to produce a good effect in the land for several years. One large plot of land which has been kept under observation shows the effect of one such application after eight years.

In well sweetened soils, not deficient in potash and phosphate clovers grow well, and on the plowing under of these and other sods, aided by thorough cultivation and drainage, the farmer should depend for his nitrogen rather than on the costly commercial nitrates. It has not yet been proved that on the tidal marsh lands the addition of any other eements besides the lime is absolutely needed. The good effects of lime are apparent every time when applied to the sour marsh, and there are cases where one application has shown good effects for forty years afterwards. Nitrates and sulphates are not required on these lands. Every piece of poor marsh the writer has tested has been sour enough to turn litmus paper red.

The excessive use of lime may make a soil too open, so the plants will not root well. The caustic effect may kill out valuable bacteria and in rich soils, especially if they are not thoroughly cultivated, it may cause the nitrogen to escape as ammonia. The danger of harm in these directions is not so very great in comparison with the one now to be emphasized. One old saying is that "Lime enriches the father and beggars the son." Why?



A Pair of Prize Winning Clydesdale Mares.

Owned by Logan Bros., Amherst Point, N. S.

When a farmer uses the lime as a stimulant without supporting it by adding other fertilizers, he increases the bacterial activity, the oxidations in the soil, and this leads to a rapid destruction of the humus or carbonaceous constituent in his soil. When this is gone, the fuel which supports soil activities, such as the dissolving out and the elaboration of plant foods is gone. In ordinary Canadian soil there is enough phosphate, nitrogen and potash to suuport continuous cropping, without the addition of fertilizers, for two hundred years, but these elements are locked up in the rocklets which compose the soil. Phosphate in the heart of a grain of sand is useless to a plant as if buried in the core of a mountain. Before the plants can be fed the soil grains must be dissolved by the acids produced by bacteria, by chemaical oxidations such as nitric and carbonic acids, by the action of lime, which corrodes the soil grains and aids the rusting of the iron in the soil, by the power of oxide of iron to act as a carrier of oxygen, as do the iron compounds in our blood, and by the movements and solution changes produced by the air and water in the soil. These activities are reduced to a minimum when the humus is gone. The foolish use of lime with the resulting rapid destruction of humus soon leads, especially if it be a red soil, that is, one rich in iron, to what is called a "worn out soil." But in most cases the humus only has failed. The soil itself is good for thousands of years, for when by the forces kept at work by good cultivation of the soil the grains of the upper layer of soil are dissoled away, the farmer is down to the second layer as rich as the first. He who burns a fierce fire gets great results, but he must stand to feed his furnace all the more liberally. By the use of lime, the farmer may greatly accelerate the work done in his soils. He practically lengthens his season, and by the abundant use of the carbonaceous matter of barnyard manure, swamp muck, and of plowed under clovers, vetches, peas, rape and buckwheat, no harm can come to his land. In many parts of the county there are black muck areas which are most valuable, as they are large stores of almost pure humus, which as top dressing, as an absorbent in stables, as an addition to composts and as soils for intensive cultivation are by no means adequately appreciated. Those sour black soils cannot be worn out by any use of lime. The only harm that could come would be a temporary injury to bacterial growth through an excessive application at one time, but on such soils even this is difficult.

The whole warning necessary may be sufficiently emphasized by repeating in another form the farmers proverb at the head of this paper.

Forever liming without humus
Will bring the farmer to the poor-house.

—By Dr. W. W. Andrews, Sackville, N. B., in N. S. Agricultural Report for 1909.

Every Farm Boy and Girl Should Compete.

Editor Maritime Farmer:—

A gentleman who has offered substantial special prizes for the best essay on farm weeds and for the best collection of pressed and mounted weeds, open to farm boys and girls, to be competed for at one of the fall fairs, has asked me to prepare a scorecard for judging these exhibits, the card to be known to the competitors in advance.

I send you herewith copies of the scorecards which I have had prepared, and should be glad to have any comments which you may see fit to make with a view to improve

them. You may observe that these cards are prepared with a view to restrict, so far as practicable, whatever advantage a boy or girl who has attended high school may have over the boy or girl who has not.

GEO. H. CLARK,
Seed Commissioner.

SCORE CARD FOR JUDGING COLLECTION OF PRESSED AND MOUNTED WEEDS.

(For competition among farm boys and girls.)

1. Specimens that are the most representative of the weeds that are troublesome in the country (not more than 50)..... 25

2. Classification into groups, according to the kind or kinds of crop in which it gives trouble, as follows, (a) grain crops, (b) clover crops, (c) meadow or pasture lands, (d) hoed crops 25

3. Each specimen should be mounted to illustrate its habit of growth and means of natural reproduction and distribution, as may be observed by the following characters of the weed. 30
   a. Roots.
   b. Stem and branching.
   c. Leaves.
   d. Flowers.
   e. Fruits (seed pods, capsules, etc.)
   f. Seeds, in bottles or gummed to paper.

4. General appearance of collection and correct information written at the bottom right hand corner of each sheet of paper to which the pressed specimen is attached, as follows:— 20
   a. Common name of the weed.
   b. Annual, biennial or perennial.
   c. Place (as name of road or farm) and date of collecting.
   d. Nature of soil and locality (as open field, ravine, etc.)
   e. Name of collector.

SCORE CARD FOR ESSAY ON FARM WEEDS.

(1200 words allowed.)

(For competition among farm boys and girls.)

Evidence of personal experience and observation on the part of the candidate of the following points.

1. (200 words allowed) Habits of growth and natural means of perpetuating its kind to be illustrated by referring to particular kinds (common names to be given) of 15
   (a) Annual or one year weeds 5
   (b) Biennial or two year weeds 4
   (c) Perennials or many year weeds 6

2. (400 words allowed) Methods of suppressing particular kinds of weeds common in the district, including, ... 30
   (a) Trial methods made by candidate and the results 15
   (b) Observations of the methods adopted by others and the results, ...15

3. (100 words allowed) Instances of how weeds have been introduced into your county..... 10

4. (300 words allowed) Instances of how weeds are distributed 15
   (a) Within a field..... 5
   (b) From field to field.....5
   (c) From district to district...5

5. (100 words allowed) Comments on losses due to farm weeds 10

6. (100 words allowed) Suggestions as to legislation to control or suppress weed growth within a municipality 10

For logical arrangement of matter 10
choice expression of thought,
correct spelling and punctuation.

Better Roads.

Editor Maritime Farmer:—

Is there any question that is of such vital importance to every live farmer as the construction and maintenance of good wagon roads.

The farmer may gather a most bountiful harvest and yet fail to realize a profit thereon owing to the fact that the bad condition of the highways prevents him from marketing to advantage.

In these days of small margins, the farmer in order to make his vocation a lucrative one, must learn to watch the markets closely and sell the products of his farm when the prices are best. In order to do this he should have highways that, no matter whether it be March or September, June or December, will always be in good condition for the transportation of heavy loads.

Of all the economic questions effecting the welfare of the farmer and every good citizen, there is none of greater importance than the construction and maintenance of good highways, over which they may pass to and fro in their commercial and social relations with one another.

How often do we hear farmers discussing the financial situation, declaiming loudly against "corners" in the market, denouncing monopolies, combines, or demanding the government to do this or that, seemingly forgetting that they themselves are a part of that government, that they are as much to blame and that right at home they uphold bad laws and shirk their duty in regard to even these. Where is the intelligent thinking farmer, who has given the subject the proper thought, who can deny the fact that many of our common road in Nova Scotia are in a deplorable condition, and that there is need of reform in the manner of collecting and expending our highway taxes.

We are told that our highway laws are patterned after those in vogue in the federal days, when, as one of their various duties, the tenants were obliged to build and repair the highways. Wherever it originated, our present system of constructing and maintaining highways is common in all parts of America, and is a disgrace to our country and the intellegence of the nineteenth century.

Some of the European countries, France, England and Scotland among the number, are now blessed with fine highways of which they are justly proud. But history tells us England was cursed with bad roads such as we find in many parts of our country today. It tells us that it was about the middle of the seventeenth century that an agitation was first started which forced her to repeal her defective highway laws, and perfect the system which they are so justly proud of today. About the latter part of tne 17th century nearly five hundred highway laws were enacted without much improvement. Finally a general law was enacted to collect all road moneys and have it laid out by competent parties and from that time the roads of England steadily improved until now Macadamized roads extend from one end of the country to the other.

Yet we today struggle along with the inefficient highways laws that England discarded over one hundred years ago. Each county in Nova Scotia is divided into so many polling districts, and each polling district has so many road districts, an overseer is appointed yearly by the County Council to look after one district, and is supposed to be held responsible for the condition of the roads under his care, and in ninty-nine cases out of one hundred, the overseer lacks the technical skill and knowledge of road-building that such an officer should possess.

Every male sixteen years of age and over is assessed according to his income, or property owned, no difference is made whether the roads in a certain district, or in one part of a certain district, is clay, sand or gravel, the assessment is all the same. The law says this work must be done between the 18th of May and the 15th of October.

Usually, about the first of June, the overseer warns out the men and teams to come on a certain day, and for a few days does his best to makes the roads worse if anything, than they had previously been. Thus, after wallowing through mud all the spring, just when the roads are getting passable, they are attacked by unskilled crews under incompetent bosses and are plowed and dug up and filled with stone, mud and loose earth, while drainage is usually ignored entirely.

In most road districts now, are owned road machines, good implements in the hands of good bosses—but in many instances they have done more harm than good. In certain sections, roads are built up from the material at hand, then gravel is drawn, often long distances, costing from fifty to eighty cents per two horse load. Along comes a new overseer with six or eight horses attached to a road machine and runs it from one end of his section to the other, drawing dirt, stones and rubbish of all sorts in the centre of the road covering up the gravel. The first heavy rain that comes turns those "improvements" into quagmires, and in the latter part of June the farmer who is obliged to use the roads is seen picking his way slowly along while the wheels of his wagon go down, down, through the "improvements" until they reach the gravel that has not been disturbed by the "road-makers."

July's hot sun drys the artificial quagmires, and soon deep ruts and high bumps are formed, over which it is extremely unpleasant and unprofitable as well, to ride.

Railroad companies have men constantly at work on their tracks, keeping them in thorough repair, but the wagon road has no one to care for it—no mud hole is filled, no hummock is leveled, and when another June comes around the road is generally in a wretched condition. Nothing daunted, the new overseer orders out his crew, more mud is piled on the road, or gravel is hauled, still neglecting to properly grade or drain. As a consequence new ruts and hummocks appear; and thus the waste of labor and money goes on year after year with little or no improvement.

Before railroads were built our main coach roads or "post roads", as they were called, which ran from one market centre, or town to another, were kept in good shape at all times and were a powerful factor in the development of our resources. Now these roads, are, in many places, more especially in out lying districts a disgrace to the country.

The question many intelligent men are now asking, is it not time for a change of some kind after hundreds of years of failure? And the same men if they dare express their views openly will be disliked by the timid and lazy who fear the trouble and dangers of a change; they will be fought by those who are satisfied with the old though evil way; and they will receive little support from men, if they dare express their views isting evils, because the remedies that they recommend will not act as a charm and instantly remove the ills. Heredity in Plants and It's Bearing on Agricultural Problems.

(Prof. C. A. Zavitz, O. A. C. Guelph.)

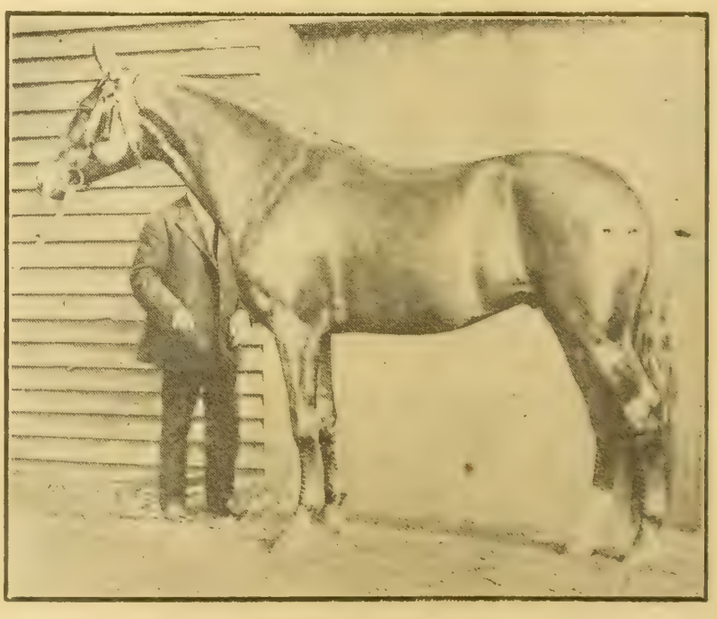
Heredity may be described as the transmission of parental characteristics to the offspring. The laws of heredity in the plant world appear to be very similar to those in the animal world. Heredity in plants, therefore, is at the very basis of plant life and consequently has a close relationship either directly or indirectly with the whole fabric of agriculture. It will be seen at the start that the subject which I have been asked to present is one dealing with some of the deepest problems of life and their relationship to the economic world. Some of the greatest scientists of the present day, such as, DeVries in Holland, Bateson in England, and Davenport at the Carnegie Institute are making the study of heredity their life work; and other men af note, such as Burbank in California, the Garton Bros. in England, Nilsson in Sweden, Drs. Wm. and C. E. Saunders in Canada, Biffen of Cambridge, Webber of Cornell University, and Groff of Ontario are working along the more practical lines of heredity as they apply to plant production. There has probably been no time in the world's history in which a greater number of men have been working or a greater interest manifested in the study of heredity than at the present time. The scientific investigations of Darwin and Mendel, and Devries and Galton and Weismann and Bateson, and of many others show us that, although great advances have been made in our knowledge of the laws of heredity, there are scarcely any of these leading scientists who will accept the conclusions of the others. While it is true that our knowledge of heredity is yet quite limited, it is also true that the advancement made during the last few years has been really wonderful. It is probably safe to say that no man in the past has exerted a greater influence in the scientific study of heredity than Gregor Mendel. At the present time, Mendelism has very strong supporters and also very severe critics. It is undoubtedly true that the Mendelian law of theory of heredity is still and will be for some time to come, the foundation of the scientific research regarding the laws of heredity. The work of Mendel has greatly changed the standpoint of investigation and has greatly altered the methods of research regarding the underlying principles of heredity in both plants and animals. Gregor Mendel was an Austrian monk who made very accurate observations of his prolonged experiments with peas. The reports of his observations were prepared and read at meetings in Austria in 1865, after which they were evidently lost sight of until they were rediscovered in the year 1900. During the last ten years, these results have been very carefully studied, and they form the basis of investigations in various parts of the world. The essential point which Mendel discovered is that, though a plant or an animal may be made up of a great many characters, those characters may possess an individuality manifested in the formation of the germ-cells. A hybrid when it comes to make its own germ-cells, either male or female, makes them in such a way that each germ-cell represents one of the pure, grand parental characters and not both; consequently, plant breeders of the present time not only study the individual plants, but look more particularly to the various characters which make up the plant as the units of heredity.

Men deeply interested in the improvement of plants and especially of those of economic value in agriculture and in horticulture are not only making a study of plant breeding themselves, but are watching the results of scientific investigations in various parts of the world, in order to secure information which will help them in securing the desired results. It is scarcely necessary to state that there are but few men who have made a searching study in the laws of heredity and at the same time who are making as deep a study of the applications of those laws in meeting the needs of the people, in the work of plant improvement. During recent years, however, a few men are endeavoring to make a practical application to our common farm crops of some of the best scientific knowledge which they can secure. In order to get the best practical results from a study of heredity in plants in its relation to agricultural production, it seems necessary to first make a thorough study of existing varieties and to then endeavor to improve the best through selection and through cross-fertilization, in order to secure those improvements which are best suited to the conditions for which they are desired. I would therefore, recommend most strongly to the scientific plant breeder and also to the practical farmer the importance of making a very careful study of the existing varieties most suitable for his purpose. That the force of heredity is great, can be seen by a study of individual varieties over several years. Allow me to draw your attention to two samples which will show the influence here referred to.

The introduction, the spread, and the value of the Red Fife variety of spring wheat in Canada show, to a marked degree, the influence of heredity and its bearing on agriculture. It is stated that in 1842, an Ontario farmer, by the name of David Fife, received from a friend of his in Scotland a little package of wheat which was taken from a cargo which had just arrived from Dantzic on the Baltic Sea. Mr. Fife sowed the wheat in the spring of 1842, but it proved to be a fall wheat and only one plant ripened. The seed of this plant was sown in the following year and the crop grew and ripened well. This wheat was increased from year to year until it is now the most extensively grown variety of spring wheat in Canada. It is this variety which is closely connected with the great reputation which Canada has obtained from its production of the No. 1 hard wheat of the Western Provinces. It probably forms the basis of more plant breeding in wheat in Canada and in the Northern States than any other single variety.

Lady Sim.
First in the Roadsters in Harness class at the Maritime Horse Show. Owned and driven by Mrs. Fred Blenkhorn, Maccan, N. S.

The history of the Dawson's Golden Chaff winter wheat is also interesting in showing the power of heredity, the importance of variety, and the results of careful observation. In 1881, Mr. Robt. Dawson, a farmer in the western part of Ontario, had a field of the old White Clawson variety. The crop was very badly lodged, but one plant was found in the field by Mr. Dawson which was upright in growth and handsome in appearance. Mr. Dawson selected this plant, and from it started what has become well known as the Dawson's Golden Chaff winter wheat. This winter wheat is now grown more extensively than any other variety in the province of Ontario. The crop retains its former good qualities of stiffness of straw, of the power to give a large yield of grain, and of its red chaffed beardless heads which contain comparatively short thick grains which are white in color.



King Dodds.
A winner at the Maritime Horse Show. First in Standard Bred Stallions' class. First in Roadster Stallions' and Champion. Owned by Dodd Dwyer, Pictou, N. S.

This last example goes to show the importance of selection. Plant selection can be conducted in different ways. The method here illustrated was very simple and also very effectual. For plant selection in a more extensive way, one of the three following methods is usually adopted.

1.—By making a composit collection of the most promising plants in the field.

2.—By making a collection of the individual plants in the fields which most closely comply with the ideal, in the mind of the plant breeder.

3.—By the use of the nursery plot, where a large number of seeds are planted at equal distances apart, and from which individual plants are selected from those which have had equal advantages of growth and development.

In the former method, the seeds of the different plants are sown collectively, while in the latter two methods the seeds from the individual plants are planted and studied separately. While the principal work of the Canadian Seed Growers' Association has been along the line of the first mentioned method, any one of the three methods here referred to may be used as the foundation work by the members of the Association according to their desire. Those persons most deeply interested in the systematic work of seed selection usually adopt either the second or the third method, or both of these methods. At the Ontario Agricultural College both the last two methods have been in use, and some very interesting results have been obtained in securing improved strains of some of the leading varieties of farm crops, such as Dawson's Golden Chaff winter wheat, Red Fife spring wheat, Mandscheuri barley, Siberian Millet, etc.

In order to illustrate what has been done in this line, I wish to refer to what is known in Ontario as the O. A. C. Number 21 barley. In the spring of 1903, 9,972 selected seeds of the Mandscheuri barley were planted by hand at equal distances apart in the Experimental department at the College. When the plants were ripe they were carefully examined, and thirty-three of the most promising ones were selected, harvested and threshed separately. In 1904, 33 separate lots of barley were grown from the plants selected in the year previous. From that time forward only the best strains were grown in the tests as follows:—14 in 1905, 8 in 1906, 7 in 1908, 3 in 1909. In one instance, over forty bushels of barley were grown in 1905 as the product of one seed planted in the spring of 1903. Of all the selected strains the one which is known as the O. A. C. No. 21 has made the best record. In each of the last three years, it has given better results than the Mandscheuri variety in yield of grain, in freedom from rust, and in both length and strength of straw in the co-operative tests throughout Ontario. The grain is quite easily distinguished from that of the Mandscheuri variety.

Ever though much care is taken in the systematic selection of farm crops, we find that the best strains of the best varieties do not always possess a combination of all the most desirable characteristics. The work of cross-fertilization enables certain combinations which it seems exceedingly difficult to secure in any other way. At the Ontario Agricultural College, we have done a considerable amount of work in cross-

fertilization with our leading varieties of winter wheat, spring wheat, oats, barley and peas within the past eight years. In 1909, we had upwards of 100,000 hybrid plants grown separately. The results are very promising. May I state that within the last two years we have secured from small plots of our hybrids higher yields of grain per acre than those obtained from the leading varieties of oats, winter wheat and spring wheat. Some of the thinnest hulled and the most beautiful oats which I have ever seen are those obtained from one of our hybrids.

I believe that there was never a time in which there were such great opportunities for excellent work in plant breeding, either from a scientific or from a practical standpoint as the present. Within the next few years there is sure to be a much clearer conception regarding the laws of heredity, and a more widespread application of those principles of crop production.

Report of the Swine Commission.

Our readers will remember that early in 1909 the Dominion Government sent a commission consisting of J. B. Spencer, Assistant Live Stock Commissioner; W. W. Ballantyne, Stratford, Ont.; Wm. Jone, Zenda, Ont.; J. E. Sinclair, of Prince Edward Island; Gideon Garceau, Quebec and Joseph Rye, representing the Western Provinces, to Europe to investigate the methods by which swine are reared for the production of bacon. We have just received a copy of their report.

The Commission sailed from Montreal on June 18th, arriving in London on the 27th. The three following days were spent in gathering information in respect to Canadian and Danish bacon, and the trade in these products. They arrived in Denmark on July 2nd, and until the 16th, followed the itinerary mapped out by the Department of Agriculture in charge of Mr. P. A. Morkeberg, Live Stock Commissioner for swine and Red Danish cattle, who acted as guide and interpreter. Returning by way of Germany and Holland, a day was spent with advantage in a Dutch bacon curing and hog raising centre. Upon returning to Great Britain, Scotland received attention first, then Ireland and last England. In addition to studying swine-rearing as a commercial work, the Commission visited prominent herds of pure bred stock, and such leading agricultural exhibitions as the "Highland" of Scotland, and the "Royal Lancashire" of England. The Commission was well received everywhere.

The time was evidently spent chiefly amongst successful breeders and feeders. The section dealing with farms of feeders visited in England is most interesting, It is shown how a very general feeling of sympathy between farmers and bacon curers has been brought about and maintained. On this point the report says:—

This comfortable and very profitable state of affairs is the result of harmonious co-operation instituted largely by the packers, who, conscious of their entire dependence on the supplies and condition of hogs. have done much to encourage production of the right sort. Messrs. Harris & Co. have interested themselves in cheapening production, but in all they have done have never lost sight of quality. Some years ago they made careful tests of breeds and crosses of pigs and after determining the superiority of the Yorkshire cross undertook to supply boars of this breed at the lowest possible cost and on easy terms of paymest. The next step was to encourage the production in quantity and quality of pigs. To accomplish thia the Wilts County Council was induced to take up a series of pig feeding experiments and demonstrations in cheap production. A committee of ten members, consisting chiefly of farmers, was formed. Contributions to carry on the work were made by Lord Lansdowne, whose estate joins Calen, the Harris Company and the County Council. A thoroughly capable and painstaking secretary was appointed to keep records, while a son of one of the leading farmers was entrusted with the actual feeding. The tests and demonstrations were carried on for five years, after which time the secretary and scientific adviser gave courses of lectures throughout the country and distributed reports.

The methods of feeding practised in the district referred to are fully described. In another section of England the report explains that a grievance between growers and buyers was overcome by farmers co-operating in the engaging of a general salesman.

After covering in a thorough way the various phases of the industry in Ireland, the report briefly reviews the sit ation in part as follows :

The rearing or swine is a popular branch of Irish agriculture. Nowhere throughout the rural districts do the people despise the pig Both extensive farmers and the more humble of the rural classes find it profitable to raise at least a small number of pigs each year. The frugal habits of the Irish peasant admit of no food refuse or damaged crops being wasted. The careful feeding of these, together with a greater or less quantity of purchased food stuffs materially helps to maintain many a small holding. The 'gentleman that pays the rent', the pig means much more amongst the frugal Irish folk than perhaps any other class or race of people.

The proximity of Ireland to the British market has for very many years proved a keen impetus to pork production. The great manufacturing centres of England require constant supplies of pork products. Irish packers and English merchants have long since come to regard each as indispensable to the other. The Irish packer has been wise in his day and generation. Not all the pork he ships bears his most cherished brand. Much Irish pork, such as that from old breeding stock, over fat hogs, and those that are too thin, are sold without identification, but no business man guards with keener jealousy the reputation of his special brands of bacon and ham than the Irish curer. From the great mass of supplies he selects most carefully the the pigs that are to be cured for the best trade. The cureing is done with equal care, and at the end of this stage only the firm sides and the lean plump hams receive the first brand. On this kind of combination Irish bacon has established itself in Britain, and on a continuation of this the trade won is held.

The Irish farmer inclines to follow a leader in whom he has confidence. This characteristic of the people is of great assistance to the Department of Agriculture in its work in aid of swine improvement. Already this has helped the quality of Irish pigs. Co-operation, too, finds a receptive soil under such conditions. This is getting a foothold in many parts of Ireland not so much in bacon curing as yet, but in the buying of supplies needed in the homes and on the farms, and the marketing of farm produce. Co-operative curing has commenced and will grow to the undoubted advantage of the Irish pig raiser, more especially in the direction of producing "Wiltshire" sides for the British market.

Leading up to the swine rearing industry of Denmark, the report reviews the character of the country, the general systems of farming, the system of education and the habits of the people. It then describes the various steps taken to bring the breed up to its present high and uniform standard for bacon production The parts played by the Government, the breeding centres, breeding societies, exhibitions, etc., are all gone into fuliy.

The treatment of the subject of feeding is most interesting and highly valuable for the Canadian pig raiser. It is shown that the system followed throughout is quite uniform and in accordance with the results of many years' experimenting. The character of food used varies with the age of the pigs. At the Government Experiment Station, Class I includes pigs up to 40 lbs.; class 2, 40 to 60 lbs.; class 3, 60 to 120 lbs.; and class 4, 120 to about 200 lbs., when they are finished. On this point the report says:—

All foods are calculated in 'food units,' using one pound of grain, such as barley, corn, wheat, etc., as a basis. In roots and other green feed the food units are estimated on their dry matter, as, for example, 8 pounds of mangels, 4 pounds boiled potatoes, 5 pounds of lucerne or 5 pounds sugar beets equal one food unit. In the case of milk, 6 pounds, and whey, 12 pounds, are calculated to have a feeding value of one food unit. In other words, the feeding value of 1 pound of grain (barley, corn, wheat, shorts, etc.) has the same feeding value as 6 pounds of milk, 8 pounds of mangels, 4 pounds boiled potatoes, 5 pounds sugar beets, or 5 pounds of green lucerne or green vetches.

The varying of the list, so as to secure the maximum of thrift and profit, is clearly explained in the report. The report goes fully into the subject of co-operation, as it is applied to buying and distributing feed, and in the organization and operation of packing plants, which are shown to be working with wonderful success.

Tables are printed, showing the prices paid for pigs to Canadian and Danish farmers for the past seven years, also the selling prices in England of Canadian and Danish bacon, month by month, since April, 1904, until December, 1909. Another table shows the wholesale price of hog foods in Canada, England and Denmark during July, 1909

An interesting feature of the report, covering about four pages, is headed "Lessons for Canadian Swine Raisers and Packers." This is divided into production and marketing. The former reviews the lessons gathered in the different countries, while the latter goes into the situation in Canada, the causes that led up to it, and the methods that have been found in the countries visited to overcome dissatisfaction between packers and farmers and thus to insure a steady supply of the desirable class of hogs. The report ends with suggested remedies, as follows :

Realizing the conditions, which called for the appointment of the Commission, and having studied the methods of successful pig raisers in other countries, Commission submits the following alternate remedies for what appears to be the chief barriers to a prosperous swine rearing industry :

1 The adoption, on the part of the packers, of an attitude of sympathetic co-operation between themselves and the producers, whereby every possible encouragement would be given farmers to increase the quantity and improve the quality of their hogs. This would involve a constant, earnest desire and readiness to afford every facility on their part in co-operation with the producers, to investigate and solve problems which may give rise to dissatisfaction. It would require the adoption of a careful grading of the prices of hogs through the year, guarding against discouraging low levels. It would require the control of buyers and the recognition of quality in the prices paid for hogs.

2 The co-operation of farmers in engaging a salesman for their hogs, as is carried out by the Eastern Counties Farmers' Association of England.

3. The adoption of the system of selling swine on the open market, as applied to cattle and sheep. By the co-operation of neighbors, car loads should be sent forward at regular intervals.

4 The establishment of co-operative packing houses, as conducted in Denmark and in Ireland.

The report, on the whole, is a creditable production of some sixty pages of text, besides a large number of engravings, made from photographs, taken by the secretary, Mr. J. B. Spencer, who acted as secretary and editor. Mr. Ballantyne acted in the capacity of chairman.

A County Assoctation Doing Good Work.

The Cumberland County Farmers' Association has been doing some work this month, fourteen meetings have been held in different parts of the County. The speakers have been Mr. L. D. Robinson, of Berwick and R. Robertson, Supt. of the Experimental Farm, Nappan. The meetings have not been as large as we could wish but the addresses have been practical and the interest good.

Spring is early, considerable plowing has been done and some grain sown. We never saw grass so good in April.

Amherst, N. S.

Growing and Using Corn For Ensilage

Corn for forage or ensilage corn can be grown to advantage in almost all parts of Canada at present occupied by farmers and stockmen. Results have not been satisfactory in every case where efforts have been made to grow it, but this has very often been due to wrong culture methods practised or unsuitable varieties grown, rather than to adverse climatic peculiarities.

REASONS FOR GROWING FORAGE CORN.

The reasons for growing or making an attempt to grow this forage crop wherever live stock are kept in any numbers are numerous and cogent. A few of them follow:M

1. As a plant capable of yielding a large amount of valuable forage under a great variety of soil and climatic conditions, corn is without an equal.

2. When properly preserved, whether as ensilage or dried, it can be used as material to render other less palatable roughage more acceptable to farm animals.

3. It is the best plant or crop for ensiloing that can be grown to advantage in Canada. It is practically a perfect crop for this purpose, hence it helps to solve the great problem of how to furnish an abundant and cheap supply of succulent food for winter or summer feeding of dairy or beef cattle.

4. When properly grown and well preserved as ensilage, it is the equal of or superior to roots in feeding value and palatability. It can, however, generally speaking, be more cheaply grown and more easily preserved than roots.

5. The labor of growing an acre of corn is of a character much more agreeable to perform and much less arduous than that of growing an acre of roots of any description.

6. Corn being a cultivated or hoed crop serves well to clean the land, that is, free it from weeds, so fitting it for grain growing, and putting it into shape to seed down to grass or hay.

7. Corn is a gross feeder and may be depended upon to make good use of a never so abundant supply of plant food. It is, for this reason, particularly well adapted to occupy that place in the rotation where humifying vegetable matter and a fairly liberal supply of barn yard manure unite to supply large quantities of plant food suitable for root, leaf and stem growth rather than for seed production.

8. The growing of corn on a fair proportion of the arable land on the farm will permit of keeping more cattle and so increase the revenue as well as augment the manure supply so essential to the maintenance of soil fertility.

9. Corn when preserved as ensilage, can be stored much more cheaply in much less space than any other roughage. In addition, stored in this way it will keep indefinitely and is always ready to feed.

10. In thirty years' experience in farming in the Ottawa valley, the writer has seen all kinds of grain crops utter failures, he has seen hay so light as to not pay for the making, and roots and potatoes practically nil, but in all that time he has never seen a failure in the corn crop. There has always been a fairly profitable return from the fields in corn.

WHERE TO GROW IT.

Corn will grow in any kind of soil, provided always that there is good drainage. Under draining is not absolutely necessary, although advisable here as with most other farm crops. On low-lying lands, ditches should be in good working condition and water furrows kept open all summer. If a choice of land may be made, then warm-bottomed light loamy soil may be expected to prove the most satisfactory under most weather conditions.

In the rotation, corn should follow clover hay, pasture or meadow. Stubble land as well as lands that have just been in hoed crops are not suitable since the supply of humus or humifying material is likely to be small, and, since corn needs much food such as these substances provide, it would probably fall short of a good crop on account of the lack thereof. Corn might advantageously come after grain or even follow a hoed crop, provided the land were very fertile or a very heavy dressing of manure were applied.

MANURIAL REQUIREMENTS.

The best fertilizing material for corn is undoubtedly good barn yard manure. A mixture of one part horse manure to three parts cattle manure applied green at the rate of 12 or 15 tons per acre, may be expected to give good results. The application might be made in the fall, winter or spring, or during the preceding summer. If ploughed in, only a shallow furrow should be turned. Commercial fertilizers are not necessary, nor are they likely to prove profitable where the above mentioned dressing of farm yard manure can be applied.

PREPARATION OF THE SOIL.

Where clay land is to be used for corn, it is generally well to plough in the autumn, turning a well set-up moderately deep furrow, (6 to 8 inches deep), being careful of course to go no deeper than usual. If light land is to be used, it is generally advisable to plough in the spring, turning a flat shallow furrow, (4 or 5 inches deep). In either case the manure may be ploughed in or worked in on the surface with the disc harrow.

The land should be worked down till a smooth, mellow, yet solid seed bed has been prepared. To get the land into such shape, it may be necessary to disc and roll several times as well as work with a smoothing harrow. In any case, no planting should be done until what might be called a perfect seed bed has been prepared. Success or failure will depend very largely upon this feature of thorough soil preparation before seeding.

SPECIAL PREPARATION FOR LEVEL OR CLAYEY LANDS.

Where either heavy clay land or very level land not under-drained is to be used it is not infrequently advisable to make special preparation by ploughing and working in a special way.

The land should be ploughed in nicely rounded ridges exactly 10 ft. 6 in. from centre to centre. All necessary cultivation should be done as to preserve the rounding surface of the ridges, and the dead furrows should be kept clean and should open into a well-kept ditch, thus insuring good drainage.

In planting, the first row should be run down the middle of the ridge and two others on the same ridge, one on each side, 42 inches away. Thus the rows on the whole field will be uniformly 3 ft. 6 in. apart and alway clear of dead furrows.

WHEN TO SOW.

Corn should be sown as early as weather and soil conditions permit. From the 15th to the end of May, according to district and season, is a very good rule. Very seldom will it do to sow later than June 5th or 6th. Sow when soil is warm and dry.

METHODS OF SEEDING.

Corn for forage or ensilage may be planted in rows or hills. If planted in rows as is usually advisable, the rows should be at least 42 inches (3 ft. 6 in.) apart. The plants should stand about 8 inches apart in the rows. In seeding, it would not be advisable to try to sow as sparsely as this. It is better to give a rather heavier seeding and then thin out to the desired thickness with a hoe when plants are 6 or 8 inches high.

If land intended for corn is very dirty, whether from the presence of weed seeds or couch grass, it is usually advisable to plant in hills. The hills should be at least 3 ft. apart each way and from 3 to 5 kernels should be planted in each hill.

For planting in rows there are special corn planting machines made by various agricultural implement manufacturers. Where the farmer has a grain seeder that sows in rows he can, by closing up part of the seed spouts, use it as a corn planter and so get along without the special implement.

If it is desired to plant in hills, here again special horse planters are available. There are also hand planters of various descriptions on the market which will enable a man to plant from two to four acres a day when the land is ready. If no planter is available, planting may be done with a hoe or even with the foot, when the soil is loose and friable.

If the hill planting is to be done other than with a horse planter, it will be necessary to mark the land off into three foot squares, the hills to be at the corners of the squares. This may be done by a man dragging a heavy chain back and forth across the field till it is marked off into three foot strips, then doing the same thing lengthwise till the whole field is marked off into three foot squares.

A better plan and much more rapid, however, is to construct a marker to run by horse power, then mark the field off into squares by running first lengthwise and later crosswise.

SUITABLE VARIETIES.

The varieties of corn to sow will depend upon the district where the seeding is to be done. For the Maritime Provinces, for those parts of Quebec north of Montreal and St. Hyacinthe, and east of Three Rivers, and for northern Ontario, Manitoba, Saskatchewan, Alberta and British Columbia, the flint varieties should be grown most largely. Some of the best varieties are Longfellow, Compton's Early, Angel of Midnight, North Dakota, White Flint and Sanford. In these same districts a few of the dents may be expected to give good results, the best being White Cap Yellow Dent. In those parts of Ontario east and north of Toronto, as far as Muskoka, in the southern parts of Quebec and in the Eastern Townships, considerably larger varieties may be expected to give good results. As varieties suitable for said districts might be men-

His Late Majesty, King Edward VII.

When the late Queen Victoria took up the sovereign's task her resolve was "I will be good." When 'Edward the peacemaker' assumed the like task his words to his people were: "It will be my constant endeavor to follow the great example that has been bequeathed to me. Confident in the royal support and sympathy of my people and of their representative assemblies, I will, with the blessing of God, solmenly work for the promotion of the common welfare and security of our great empire over which I have now been called to reign." How loyally he kept that vow the judgment of history shall declare and on his death bed, he could truthfully say: "I have done my duty."

tioned any of the flints, White Cap Yellow Dent, Leaming and occasionally some of the larger varieties as Mammoth Cuban or Early Mastodon. In those parts of Ontario south and west of Toronto, any variety, no matter how large, may be expected to give satisfaction. When sowing in rows, it will be found best to sow about 25 lbs. of the flint varieties and about 30 lbs. of the dent varieties per acre. Sowing in hills requires less seed, about 15 lbs. flint and 18 lbs. dent per acre.

EARLY CROP TREATMENT.

A few days after seeding, say the third or fourth day in warm wegther, it is well to run over the field with a slant tooth harrow or lacking this, with a light smoothing harrow. This will break the crust, destroy any weeds and help warm the soil, thus encouraging growth of the corn. A few days after the corn is up, and when it can be seen distinctly in rows, it is often advisable to run the light smoothing harrow over it again. This time it had better be run across the rows. Subsequent cultivation will need to be done with special cultivators.

LATER CULTIVATION.

For working the land until the corn stands about three feet high in the rows or hills, the two-horse riding cultivator will give the best results. This implement straddles a row and gives the soil on either side thereof thoroughly good cultivation, being in this respect much superior to the one-horse walking cultivator. The latter iimplement will, however, be found valuable and necessary after it is no longer possible to work the two-horse cultivator.

The cultivator should be run through the crop, shortly after any considerable rain fall or about once a week in dry weather. As the season advances, a lighter and lighter cultivation should be given. Work may be stopped usually when the corn is so high as to hide the horse and driver from view, but sometimes, however, later cultivation will pay. This will be the case when a superabundance of weeds shows up, may occur in a very wet season, or when the corn suffers from drought in a very dry season.

Very seldom, if ever, will it be found advisable to rib up the corn. Such treatment might occasionally be advisable in a wet season on very low-lying or heavy land, never on light soils.

HAND WORK.

A certain amount of hand hoeing is usually necessary. This should be done first when the corn is six or eight inches high. The thinning to eight inches apart in the rows should receive attention at this time. Plants should be cut clean out to prevent suckers coming on again. Later it will likely be found advisable to again go over the field and remove any further weeds that may come up in the rows. As already stated, when a field is particularly dirty, it is advisable to sow in hills and the cultivators can then be worked both ways. The amount of hand hoeing will in this way be very much lessened.

ENEMIES AND DISEASES.

The corn crop of Canada is remarkably free from enemies and diseases. In our experience here, crows at seeding time and smut at earing time are about the only troubles worthy of note.

Crows.—The crow generally attacks the crop when first the young plants shoot through the soil, or even earlier. There are two effective ways to guard against this winged enemy.

First.—If corn is to be planted by hand, the following method will be found effective. Immerse corn for two or three minutes in water as hot as can be borne by the hand. Drain water off and while still damp and warm add warm coal tar at rate of half a cupful per gallon of corn. Thoroughly mix the corn and tar till every kernel has more or less tar on it. As a drier add a small amount of lime, plaster, or even dry road-dust. If the mixing and drying has been well done, seed so prepared may be sown by machine.

Second.—When crows are noticed on the field, take some corn, say two gallons, more or less, according to size of field it is desired to protect and boil for about thirty minutes in water, just sufficient to cover corn and an inch to spare. To the water and corn, before boiling, add about ½ oz. of strychnine, or better still of strychnine sulphate for each gallon of water. Allow the corn to lie in the strychnine and water over night. In the morning, drain off any water remaining and scatter the corn thinly over the field off which it is desired to frighten the crows.

In making use of the above plan, great care should be taken to pour water off corn into some hole, or on some spot not likely to be frequented by children or domestic animals. Care should also be taken to keep poultry off corn field for some two or three weeks after poisoned corn has been scattered thereon.

Nothing practicable can be done to prevent smut, excepting possibly the gathering and burying of affected ears.

WHEN TO HARVEST.

Corn will be ready for forage or ensiloing when the grain or kernel is in the dough stage and has begun to glaze. If weather conditions are adverse, that is, cold and wet, it is often advisable to cut before this stage of maturity is reached, when for any reason the crop is late maturing. Frost does not spoil the crop for either forage or ensilage, but the feeding value is quite materially lessened if the leaves and stalks are badly frozen.

CUTTING THE CORN

Special machines called corn harvesters are manufactured by various agricultural implement companies, and, where considerable areas of corn are grown, will be found practical and economical. The farmer who grows only a few acres would not find it to his advantage to invest in such a machine. The corn may be cut from three-quarters of an acre to an acre and a quarter in a ten-hour day, using one of the above small tools. With the corn harvester, in ten hours, a man with a good team can cut from four to six acres, according to condition of the corn.

MAKING AND PRESERVING DRY CORN FODDER.

Where no silo is at hand to use in storing and preserving the corn, very satisfactory results may be expected by drying the crop for fall or winter use. To preserve in this way, the corn should be bound into sheaves 8 to 12 inches in diameter and five or six of these made into an open but firmly built shock, the tops being bound together to lend further strength. These shocks, if well built, may be expected to stand as long as it is desired to leave them in the field. In fact ,not a few farmers haul them in as needed all winter.

If barn room is available, they might be hauled in and stored on top of mows or elsewhere, care being taken to place them erect and not to pack too tightly as there is danger of heat or mould. If the corn is fairly dry and straw is plentiful, the corn might be hauled and stored among the straw, placing it in layers, being careful to have a good thick layer of straw, at least 2 feet, between the layers of corn sheaves.

Where it is not desired to leave in shocks in the field and no barn room is available, a fairly satisfactory plan is to haul to the near neighborhood of barn and stand in rows on either side of trestles so arranged as to allow prevailing winds to blow down alleys between rows of corn.

FEEDING CORN FODDER.

The best method of feeding dry corn is to run enough of it through the cut box to last a week or ten days. Mix straw or cut hay with this cut fodder corn. This mass will quite probably heat to a certain extent but this will increase the palatability, unless allowed to lie for too long a time. It is possible of course to feed without cutting, but considerable loss of food and comparatively unsatisfactory results may be anticipated when the forage is fed uncut.

ENSILOING.

The really best way to preserve corn and the way to get the greatest returns from the field in the shape of food, is to store it in a good silo. If very juicy or lacking maturity when cut, it is often well to let it lie for a day or two between cutting and ensiloing. If very dry when cut, it is sometimes well when ensiloing to pour a few gallons of water around the wall of the silo for each foot in height as the ensilage rises, say one gallon to one foot in circumference of the silo at each foot in height of rising ensilage.

In any case, the corn should be cut into short lengths, the shorter the better, say half-inch lengths and well mixed, the leaves with the stems and ears all the way up. It is well also to tramp and fill most carefully around the walls.

It is impossible to properly fill the silo at the one time. It should be filled to the top, allowed to settle for a few days then filled again. It is advisable to repeat this settling and filling more than once if possible.

When filled for the last time the surface should be nearly levelled, slightly higher in the middle if anything, and well tramped. If possible to put a few barrels of water on the surface, less waste may be anticipated. Particularly is this true if the water is used freely around the wall.

THE CUT BOX.

Two distinct types of machine exist for cutting corn into the silo, the chain elevator cut box and the blower.

The chain elevator box will do satisfactory work with less power than will the blower, hence is the advisable kind to buy for the man whose motive power is small. A good two-horse tread power will drive a fair sized chain elevator cut box at moderate speed and raise the silage 30 feet. A very much greater power is required to drive a cut box of the blower type. Another reason in favor of the chain elevator type for the farmer who must own his cut box is the smaller number of men required to handle economically. However, where all the men and horses necessary can be counted upon and a powerful engine is available for driving, then the blower type of cut box may be expected to do the work of filling the silo more cheaply and much more expeditiously than one of the chain elevator sort.

In any case, great care should be taken to keep all machinery in good running order, and particular attention should be paid to keeping the cut box knives sharp and properly set.

USING ENSILAGE.

The ensilage will of course always be taken from the top when it is being fed out. The surface should be kept as level as possible and in winter it will be found good practice to keep the surface a little lower around the wall than in the centre. This will largely prevent freezing to the walls or into the body of the ensilage. Frozen ensilage once thawed out, is, however, quite as good as any other.

Ensilage may be fed direct to cattle just as it comes from the silo, but a better plan is to add to the ensilage a considerable amount, say 10 or 15 lbs. of cut hay or chaffed straw to 100 lbs. ensilage. If floor space is available for the purpose, mixing sufficient cut hay or chaff and ensilage to last several days (3 or 4) will prove to be a very satisfactory method of preparing feed for cattle and a method that they would seem to approve. Any meal to be fed should be thrown on the mixture of straw and ensilage after it is in the manger. Stir the whole mass after sprinkling meal. An average cow will consume about 40 lbs. of such a mixture of ensilage and straw or hay a day.

RATIONS INCLUDING CORN ENSILAGE.

Corn silage and straw or chaff, while together making up a most excellent foundation or base, do not alone constitute a well-balanced or suitable ration for any class of live stock. For f¼eeding heifers or young stock some bran and clover hay should be added. A suitable ration would be:—

For yearling heifers:—
- Corn silage .....25 to 35 lbs
- Straw or chaff ..... 4 to 6 lbs
- Clover hay ..... 4 lbs
- Bran ..... 2 lbs

For dry cow:—
- Corn silage .....50 to 60 lbs
- Straw ..... 8 to 10 lbs
- Clover hay ..... 4 lbs
- Bran ..... 1to 2 lbs

For cow in milk:—
- Corn silage .....45 lbs
- Straw..... 6 lbs
- Clover hay ..... 4 to 6 lbs

Meal mixture: bran, oats, gluten or oil-cake meal or cottonseed meal, equal parts. One pound meal to three or four pounds milk produced per diem.

For steers running over winter (1000 pounds weight):—
- Corn silage .....60 to 75 lbs
- Straw ..... 8 to 12 lbs
- Clover hay ..... 2 to 4 lbs

For fattening steers (1000 pounds):—
- Corn silage .....50 to 60 lbs
- Straw ..... 6 to 10 lbs
- Hay ..... 3 to 6 lbs

Meal—Starting at one pound go up to 10 lbs. per diem.

A good meal mixture would be corn, bran, barley and oil cake meal, gluten meal or cottonseed meal. Take bran and corn, bran and barley, equal parts, of bran, corn and barley, equal parts, to which add an amount of any one of the last three equal to one-quarter of the total weight of the meal mixture when ready to feed.

COST OF GROWING ONE ACRE CORN AND PUTTING SAME IN SILO.

Ploughing	$2.00
Disc harrowing, ½ day.....	1.25
Harrowing, ¼ day	0.62½
Seed, 20 lb. at 2 cents per lb...	0.40
Planting 1-10 day with team...	0.25
Harrowing and cultivating (10 times	2.50
Hoeing, 1½ days	2.25
Cutting, ¼ day with team.....	0.62½
Hauling, one day, team.....	2.50
Men loading, unloading and and ensiloing, 3 days.....	4.50
Use of power for cutting, &c...	1.00
Use of machinery and twine...	.50
	$18.40

To this might be added $3 for rent and $3 for part of manure used up. This would make a total cost of $24.50. From an acre of corn worked as indicated, from 14 to 20 tons ensilage might be expected.

DOES IT PAY?

Does it pay to buy cast-off farm machinery? This is not a question that applies to many farmers, yet there are farmers, mostly beginners, however, who try to economize in their expenses by taking what some extravagant man has thrown to one side. It is a question sometimes when one sees a lot of old farm machines piled up in the barnyard whether it is evidence of waste or economy.

The progress of improvement has been so rapid in farm machinery in the last twenty years that the farmer could scarcely keep himself supplied with the improved, up-to-date machinery and get much wear out of his purchases. There have been times when farmers bought too extravagantly of machinery. Machinery was high-priced and farm crops low-priced. The farmer went in debt for machinery and could scarcely make enough to pay his obligations to the implement dealer at the end of the year. There was considerable mismanagement, however; machines were left standing out in the weather all year, often left in the field where last used and were damaged and out of fix when needed for the next season's work.

Care of farm machines has improved greatly in the last few years. It is now quite a common thing to see the farm machines of all kinds put under roof when the crops are laid by and the harvest is gathered. In addition to this better care there is more attention paid to repairs for these machines than formerly. There are some parts of a machine that may wear rapidly, while the main frame and expensive parts will last as good as new almost indefinitely. A mechanical farmer may make money or save money by buying an old second-hand machine, because he sees how he can have it put into good working condition by buying a few needed repairs.

It is usually poor policy to buy some farmer's old machine. The time lost in repairing and tinkering up an old machine and the risk of it not giving good satisfaction in its operation counts seriously in lost time with the hand who has to use it. Time is money now more than at any former period in the history of our country. The new machine, in proper working order and carefully handled, will be found to be the best investment. It does not pay, as a general proposition, to buy an old or second-hand farm machine.

WOMEN'S INSTITUTES.

"The Provincial Department of Agriculture has arranged for the holding of 570 women's meetings throughout Ontario during the coming summer. This is over 50 more than last year and creates a departmental record. All the constituencies will be covered, except a few in eastern Ontario, and organization meetings will be held in those districts which were never served before. The series includes over 100 meetings in northern Ontario, which indicates the growth of settlement and agricultural effort in the newly-organized districts.

"The Women's Institutes are materially extending the scope of their influence and effort. Many public-spirited enterprises have been undertaken by their organizations. In Manitoulin they purchased a buggy for the Presbyterian student who ministers to the spiritual needs of the district. In another locality they erected a fine fence around the local burying ground. In two villages they undertook the lighting of the streets at night. At other points they have defrayed the expense of putting in drains and water service, while in a great number of places they have inaugurated and paid for a tree-planting and beautifying campaign. In Parkhill the Institute has entered into a co-operative campaign with the Grand Trunk for the beautifying of the surroundings of the railway yards."

The foregoing information, furnished by Mr. G. A. Putnam, Supt. of Women's Institutes for Ontario, will be of interest to our lady readers. It shows what is being accomplished by Women's Institutes in Ontario and also furnishes an ideal which the ladies in the Maritime Provinces could well mitate.

There is as yet very little organization along these lines in Nova Scotia, New Brunswick and Prince Edward Island. There is room for more work along these lines in our midst and we trust that ere long our most progressive ladies will clamor for organization on an extensive scale. We know the "powers that be" in the respective provinces will assist the cause in every possible way.

We would suggest that the ladies of the respective districts club together and get in touch with each other.

County meetings, which delegates from the respective districts could attend, might then be held and once a year a large provincial meeting, such as is held by the Nova Scotia Farmers' Association and the New Brunswick Farmers' and Dairymen's Association, might be the capping stone of the organization.

The ladies of Prince Edward Island held two days conventions last year and also this year at Summerside.

We hear occasionally of meetings of a smaller scale being held in various parts of our provinces.

The work is a commendable one, which will be more and more realized as it progresses.

Carry it further until every highway and by-way in Maritime Canada will be organized.

PRACTICAL DEMONSTRATION.

The Dairy Commissioner, Mr. J. A. Ruddick, has completed arrangements for carrying on an extensive series of experiments during the present season, having for its object the improvement of the creamery industry in Canada. The work will be in charge of Mr. Geo. H. Barr, Chief of the Dairy Division, who will be assisted by Mr. J. G. Bouchard, creamery expert, and other members of the dairy staff. There could be no better assurance that the work will be carried out carefully and intelligently.

Speaking of the proposed experiments, Mr. Ruddick intimated that they would be conducted at a creamery and at the farms of some of its patrons somewhat on the lines of the experiments in the cooling and treatment of milk, which were conducted by Mr. Barr during the past two seasons, the results of which have already affected so marked a change and improvement in the methods of handling miik for this purpose.

Mr. Ruddick is a strong believer in the value of practical demonstration or illustration in matters of this kind and he points to the success which has followed the Department's demonstrations in the cool curing of cheese and to the work already referred to in connection with the handling of milk.

The creamery industry, in many parts of Canada, is now conducted on what is known as "The Cream Gathering System." It is recognized that the methods at present followed in operating creameries on this system are defective at certain points and these defects make it difficult to secure the highest results in quality. Many leading dairymen have opposed the adoption of this system on these grounds, but as the farmers are determined to stick to it and it is their right to do so, if it suits them best, it seems desirable that every effort should be made to put the system on the best possible working basis.

"We do not propose," said the Commissioner, "to encourage the substitution of the cream gathering system for the whole milk system, but we shall endeavor to improve existing conditions."

The exports of butter have fallen off during recent years, but there is no decrease in the quantity manufactured and it is just as important as it ever was that the quality should be of the highest class and that the creameries should be conducted on economical lines, not only in regard to cost of operation, but so as to ensure the highest possible return from the raw material supplied.

ECONOMY IN PRODUCTION.

It is not enough to produce a crop on the farm, but it must be produced under strict methods of economy. This means the greatest possible yield for the least possible cost. The handling of the farm means much more now than when lands were low-priced. There is a greater demand in getting a profitable yield of the crop produced. The best paying market crops are studied more carefully now as to demand and to probable yield. The question of soil fertility is also taken into account in the planning of the crops to be produced.

The idea that crops can be produced from lands and still increase the producing power of land is being taken up in view of soil improvement where deterioration exists. Soil improvement is where the land owner looks to the land for part of his profit in farming instead of expecting it all to come from the crop produced. Feeding the soil by crop rotation and crop fertilization is in the line of economy in production.

Economy in production may also be practiced in the selection of crops that are in greatest demand in the markets of the country. The profitable crop, the easily marketed crop, the crop that offers strong resistence to perishable influences, the crop that has an every-day demand, should be studied in view of its adoption into the list to be used.

SOW SOILING CROPS.

Don't forget that although there are many evidences of abundance of grass in the pastures during the coming summer, the usual season of short pasturage will surely follow. If you would keep up the milk flow during the short pasturage season, you should, by all means, prepare a field on which to sow mixed grains, to use as soiling crops. Now is the time to attend to this matter. It is too late to do so when the milk supply runs low and your stock is half famished for want of sufficient sustenance.

* * *

Does your farm wagon need painting? Why not try to do it yourself? Take off the wheels, strip the other loose parts, wash the woodwork carefully, get a can of good paint that is used for such work, and a brush, and go at it. Have the wagon on the barn floor out of wind and storm.

Every Stock Raiser Should grow Rape.

Editor Maritime Farmer:—

One of the most neglected crops on the average farm is that of rape. There are many reasons for this neglect. The chief one, I think, is that its value as a flesh producing food is not generally known; then there is the extra work for the already busy farmer, but, I think if its value was more generally known every farmer would find time to prepare at least a quarter of an acre and sow to rape. As a flesh producing food with a minimum of expense, all who have grown it will agree, that rape is not excelled by any other food. Fed in conjunction with a light grain ration to lambs and young hogs, it makes an almost ideal ration.

There is something in the tender young leaves of the rape plant that seems to keep the system in splendid condition for its work as well as supplying food to produce flesh. Then, again, if the young animal is to be pushed rapidly forward, either for market or show ring, a larger amount of grain can be fed in conjunction with rape than if fed alone, as the rape offsets the dry consentrated grain food, thereby keeping the animal in a healthy, vigorous condition and enabling it to assimalate all the nourishment contained in its ration and thus increasing its gain in flesh, proportionately. We have been growing rape for many years, chiefly for the purpose of fitting a flock of show sheep. We could not do without it for this purpose but it is just as valuable for market lambs, hogs and young cattle. As to the difficulties met with in growing rape, I think there are none. Anyone who has grown turnips need have no fear of a failure in growing rape. The preparation of the ground for rape is exactly the same as for turnips. A piece of stubble land, fall plowed, worked and plowed again in the spring, a good coat of farmyard manure applied and if you wish to bring it along very rapidly apply superphosphate at the rate of 400 pounds per acre; this contains plant food readily available to the young plants, which brings them along very rapidly. Rape seed is exactly like turnip seed and can be sown with the turnip-seeder in drills rather than broadcast, as this allows for a space for the lambs to walk in without tramping any of it down.

Rape should be sown about the last week in June or the first week in July, then it will be fit for the lambs about the first of September; by this time the grass will be getting scarce. There is no fear of the lambs scouring or bloating on it, the first week as they will not eat much till they get used to it. After that do not turn them on when it is wet or when they are hungry. One hour, twice a hay, is plenty for them till they get it eaten off a good deal then they can be left on all thetime. More precaution should be taken with older sheep as they will eat more than is good for them, in a short time. If possible, have the piece of rape adjoining a pasture field; this will make it more convenient in handling the lambs.

If you wish to feed it to the hogs, a piece can be fenced off and cut and fed to them, or another piece may be put in near the barn and the hogs pastured thereon. Any farmer who is in a position to give this profitable crop a trial ought to do so and I can assure him that once having done so he will not do without it another year.

International Commission on Control of Tuberculosis Among Domestic Animals.

It seems desirable that the public should be given opportunity to know what this Commission is doing in as much as the Commission represents indirectly the Canadian and United States governments, and involves live stock sanitary control work of all of the inhividual states.

The last session held at Detroit was devoted largely to reports. There were present representatives of Canadian and American breeders, Canadian and United States Departments of Agriculture, American and Canadian veterinarians. The following reported: Committee on Education and Legislation; Committee on Location of Tuberculosis in Cattle; Committee on Dissemination of Tuberculosis, and the Committee on Disposition of Tuberculosus Cattle. The Committee on Education and Legislation mad e a partial report presenting a critical study of experience of certain states in their efforts to deal with this problem. The purpose of this was to present full information for the Commission concerning mistakes and failures and comparative successes of communities that have undertaken serious work with tuberculosis.

The committee on Location of Tuberculosis in Cattle presented their report under such headings as "Provisions for Notification", Location by Tuberculin Test," "Location of Infected Herds Through Meat Inspection Services," "Most Important Sources of Animal Tuberculosis."

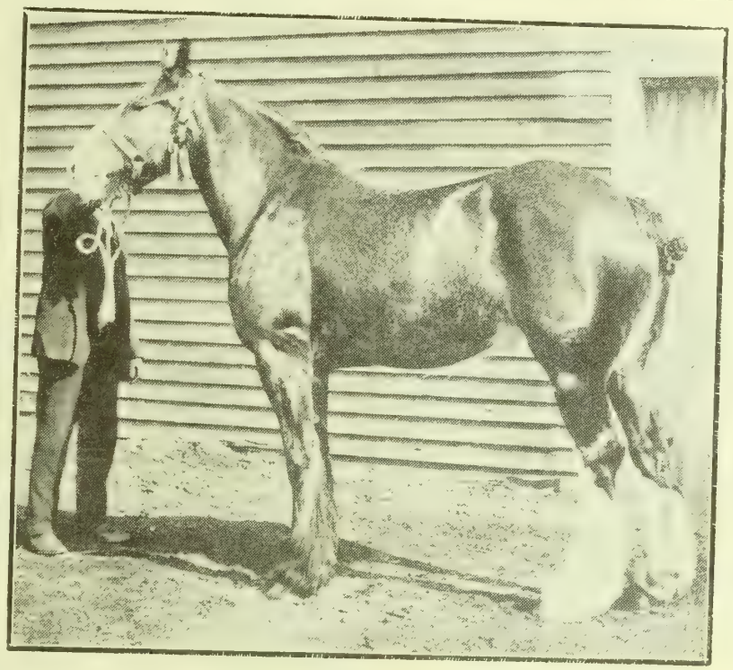
The Committee on Dissemination of Bovine Tuberculosis presented its study under such headings as "Introduction of Disease Into the Herd," "Dissemination by Feeding to Calves," "Dissemination by Contact at Shows," "Dissemination by Placing Healthy Animals in Contaminated Stables," "Dissemination by Transportation of Healthy Animals in Infected Cars," "Dissemination by Pasture Exposure." The discussion of this report gave considerable attention to the problems of tracing back from the killing floor to the infected farm with a view to detecting the diseased herds and concentrating control work as much as possible on diseased herds.

The Committee on Disposition of Tubercular Cattle reported concerning the necessity of accepting tuberculin for diagnosis as a fundamental; the necessity of voluntary co-operation, and the superiority of voluntary co-operation to measures of compulsion. This committee considered the feasibility of the Bang and Ostertag methods of dealing with tubercular herds under American conditions. It also made recommendations concerning the relation of indemnity to final disposition of carcass; the principle of carcass salvage; the obligatory disposal of all clinical cases; and a study of the conditions which should determine the disposition of reacting cattle.

A very considerable amount of discussion on this report was given to the question of remuneration for owners and particularly as to whether this should be regarded as a temporary or as a permanent provision in tuberculosis control work. A number of members held that it must necessarily be considered as a useful preliminary and temporary measure.

Careful consideration was given to the possibility of making either the Ostertag or Bang method of dealing with tuberculosis in the herd, or a combination of the two, feasible in America and Canada grade herds. This is along the line of finding some method more economical than slaughter for as many herds as possible.

The next meeting of this International Commission will be held in Ottawa. R. H. REYNOLDS,



Pink Rose.

Substitute Roots For Concentrates.

Recent investigations indicate that mangels may be used economically, in rations, to replace the grain ordinarily fed to dairy cows. The way seems to have been opened for a revolution in feeding methods, according to Bulletin 268 of the Cornell Experiment Station, entitled "The Substitution of Roots for Concentrated Foods in Rations for Milk Production." Mr. J. H. Grisdale, Agriculturist, Central Experimental Farm, Ottawa, practically confirms the findings of the Cornell experiments. He writes: "Nine pounds of roots for one pound of meal will, up to half the quantity of meal fed previously, be found satisfactory."

During the last six years the cost of concentrated feeding stuffs has increased steadily. The possibility of placing before our farmers a means by which they can reduce their grain bills materially and produce more of the food for their own cows on their own farms, is suggested by the results of these experiments. Danish experiments relative to this subject seems to indicate that one pound of dry matter in roots is equal to one pound of mixed cereal grains. Such results from Danish experiments suggested similar work to the authorities at the New York Station. The purpose of the Cornell experiments was to determine the value of the dry matter in mangels as compared with the dry matter in silage and to determine the value of the dry matter in mangels as compared with the dry matter in grains, in rations for milk producing cows.

The results of the experiments at the Cornell station seem to agree with the results of the Danish experiments and perhaps go a little further, in that they seem to justify the conclusion that one pound of dry matter in mangels is equal to one pound of dry matter in grain, at least when one-half of the grain ration is replaced by mangels; so far as feeding value is concerned in the production of milk, this seems to be a safe assumption from the data obtained.

Taking into accounts the facts given in their summaries, the Cornell experimenters have thought it safe to draw the following conclusions as being true under the conditions noted.

1. The amount of dry matter required to produce one pound of butter fat, taking the average of the results of all rations fed in this experiment, was 28.83 pounds.

2. Less dry matter was required to produce one pound of butter fat when mangels were fed as a succulent food with a full grain ration than with any other combination.

3. The average cost of one pound of butter fat under all conditions was 22.4 cents.

4. The lowest price at which a pound of butter fat was produced was 20.7 cents, with ration I (hay grain and silage).

5. The cost of one pound of butter fat with ration II (hay, grain and mangels) was 27.4 cents. This was considered too high to be economical.

6. The cost of one pound of fat with ration III (hay, grain, mangels and silage, grain ration reduced one-half by substituting mangels) was 20.6 cents. Since the cost of one pound of fat in the check group averaged for the two years 20.6 cents, ration III was considered economical.

7. One pound of dry matter in mangels is a little more than equal to one pound of dry matter in silage.

8. One pound of dry matter in mangels is equal to one pound of dry matter in grain, and mangels may replace one-half the ordinary grain ration with mixed hay and silage.

9. Accepting the average price of commercial feeding stuffs at $30 a ton, and considering one pound of dry matter in mangels equal to one pound of dry matter in grain, mangels may be used economically in the ration to replace one-half the grain ordinarily fed when they can be produced and stored ready for feeding at $4 a ton. In arriving at this conclusion, the average amount of dry matter in grain is considered to be 90 per cent. and in mangels to be 12 per cent.

10. It would seem to be a safe assumption that farmers can raise mangels for $4 a ton and thus reduce their feed bill very materially by the judicious use of mangels to replace one-half of the grain ordinarily fed in the ration.

HORTICULTURE

The Use and Beauty of a Garden.

A young woman was once heard to say of her brother that he "put up ice in the summer and planted peanuts in the winter," and the majority of our farmers pursue a noticeably similar policy in the matter of making a garden. In the winter, when the larder affords no variety from the traditional pork and potatoes other than that which may be obtained from canned tomatoes and dried fruits, bought at the store, they firmly resolve that "next year we will make a good garden," and perhaps their zeal carries them even to the point of buying fifty cents worth of seeds and setting aside in their minds a certain quarter of an acre to be devoted "next year" to the growing of vegetables.

But alas! for the frailty of human endeavor! In the spring, when the mellow brown fields seem to wait impatiently for the harrow and the drill, when machinery must be put in order, and fences repaired, and seed grains fanned and graded, when, in short, the brief and fleeting days of the annual seed time are upon us, and even the lengthening days are too short for the tasks that each one brings, so much of the good intention goes to assist in the paving of a certain ill-reputed place that if there is enough of it left to get the fifty cents worth of seed so much as thrown at the garden, it is matter for comment.

Since, therefore, the average farmer either cannot or will not find time to make a garden, that task, like the care of poultry must necessarily devolve upon the farm woman.

To a great many people a garden means only a place for the growing of vegetables—a place where intermittent rows of onions and cabbages battle for precedence with crops of weeds, the battle going inevitably to the strong. Such a garden is as transitory and unsatisfactory as the annual flowers which cannot be planted until so late that their earliest blooms are but heralds of the frosts that are so soon to destroy them.

But your real garden is a hardy perennial—a permanent institution, not to be carelessly located or lightly transferred. It contains so many delightful things which live through the coldest winter and reappear with renewed vigor in the spring, that the vegetables which are sown each summer, though quite indispensable, are nevertheless little more than an incident in the complete cycle of the garden's existence.

To such a garden as this the busiest farm woman may well devote a portion of her closely filled time.

There is of course a great deal of labor in connection with the making of a good garden that a woman cannot do, such as hauling of fertilizer, spading or plowing the ground, setting out of small fruits, etc., but she is a simple woman indeed who cannot induce her men folks to do those things for her.

A garden should properly contain only small fruits and summer vegetables, with such herbs or flowers as the taste of the owner may dictate, all vegetables intended for winter use to be relegated to the fields where they can be cultivated by horse power. Such an arrangement renders the garden small enough so that the labor involved in its care is not prohibitive.

The formula which spells success with a garden, calls for about equal parts of enthusiasm and labor, and both of these ingredients, the average farm woman should be willing and able to give.

The spot selected for the garden should, for obvious reasons, be near the house. It should be protected from marauding hens either by being fenced in or by having the hens fenced in. The soil must be made as fine and mellow as possible, and it must be heavily fertilized. It is as useless as it is unreasonable to expect good results from poor soil. A plant can no more thrive and become fruitful in a soil which is lacking in the elements of plant food, than a child could grow to perfect maturity on poor or insufficient food.

The ideal garden must contain, in addition to its summer vegetables, rows of raspberries, gooseberries, currants and strawberries, as well as a bed of asparagus and a dozen hills of rhubarb and to be really perfect, it should have its corners spaded up and planted to herbs and sturdy-growing flowers.

A garden such as this ministers richly not only to the material but also to the aesthetic needs of its owners. It yields crisp salads and sweet cool fruits for the table and enhances them by bowls of bloom and sweet odors of thyme and fennel. In the spring, almost before the first bluebird has come, it stirs into life, showing delicate green with its chives and asparagus, and delicate maple-red where the rhubarb is poking its fingers through the dull earth. In summer it yields uncountable good things, and even in winter its brown stalks wave friendly hands to us across the snow, and whisper softly of sunnier days to come.

H. M. W.

More Attention Should Be Paid To Vigor and Utility Than Shape.

In selecting nursery trees to set out a fruit plantation, it is of prime importance to possess an idea of what is and what can be considered to be first-class stock. Various conceptions on this point are held by the very best fruit-growers but the consensus of opinion resolves itself to somewhat of this description. Stock to be first-class must be thrifty, clean, of good growth and of a character and shape true to the variety.

It would be impossible to lay down a hard and fast rule as regards the shape of a tree that would be broad enough to cover all varieties of nursery stock. Some of our best varieties are naturally, if grown on their own stock, crooked, gnarled and ugly. But what matters that, if while corresponding to characteristics the tree is thrifty and of definite weight, the bark is clean, of good color and devoid of insect injury, and the twigs are full of vitality and life? Such points as these are of greater importance than the actual shape. While it is desirable to have a tree with a central leader and three or four side branches symmetrically arranged on a straight growing trunk, it is not always to be expected.

Two points can now be deducted. First, it is more important to pay attention to vigor than to shape; and secondly, select your varieties from the market qualities of the fruit that the tree will in time produce, being thereby not deluded by the seemly appearance of a tree growing in the nursery row. It is well to remember, in this latter connection, that it is the fruit-grower and not the nurseryman who should set the demand.

class should be one of medium size.

Furthermore, a tree to be first-The majority of two-year-old apple or plum trees, for instance, should go about three-quarters of an inch, four inches above the bud. Quite a number of the sweet cherries should run about the same. No definite rule again can be given but it would be well to mention that it appears that the prevailing opinion decides in favor of trees rather under the average in diameter in preference to trees above the average in diameter. Possibly if the trees did not have to be transplanted from the nursery row, the larger size would be in favor.

At the present time it is found that the planting of one-year-old stock is yearly gaining ground. It would appear that the tenderer the tree the younger is it purchased, so that it can become established quicker; for example, peaches and sweet cherries.

One point further might be mentioned. If our tree is all that can be desired as regards shape and thrift, it might be a litter closer to perfection if the bud or scion from which the tree has grown had been taken direct from a bearing tree. While it is unreasonable to suppose any difference between a normal mature leaf bud taken from a nursery tree and a similar bud taken from a bearing tree, yet yearly taking scions from a number of nursery trees naturally allows of a system of inbreeding which might result in slight harm. Nurserymen are in the habit of renewing their buds from bearing trees every so many years, so that the possibility of deterioration is reduced. The elements of heredity are presumably present in every bud and a type once established naturally breeds true, so that if there is a falling off it must be due to adverse selection, accidental or otherwise.

COMPRESSED AIR, FOUNTAIN SPRAYER

Requires but one pumping to empty entire contents of tank. Automatic lever valve stops flow of liquid while going from one plant to another. Easy, light, compact; tested to stand 5 times the pressure required to expel liquid. Two nozzles, with hose attachment for spraying small trees. Write for catalogue. 1

THE EUREKA PLANTER CO. Limited, - Woodstock, Ont.

A Manual of Gardening.

In the realm of horticulture no name is better known throughout Canada and the United States than that of Prof. L. H. Bailey, of Cornell University. Through his work as a teacher and as the author or editor of numerous books, he has become the leading authority in all that pertains to the garden. Two of his earlier books were "Garden Making", and "Practical Garden Book," which found a wide circle of readers. A new volume is oow offered, which is a combination and revision of the other two books, besides containing much new material and the results of the experience of ten added years. Like all of Prof. Bailey's productions, it is splendidly illustrated, there being twenty-five full page plates and numerous smaller cuts distributed over the 525 pages of the volume. Considerable attention is devoted to the planning of grounds and the growing of ornamental plants. On te assumption that every family may have a garden, even if it is limited to a tin can on the window sill, the book indicates that there is a wide choice of shrubs and flowers to fit into the widest stretches or the smallest corner. The reader will be helped in his choice of plants suitable to his surroundings by a study of the pages. Diseases and insect pests injurious to vegetation are dealt with in a special chapter, in which the several spraying mixtures are enumerated. Fruit and vegetable culture is given a place making a most complete volume on horticulture. The book is published by the MacMillan Company of Canada, Ltd., Toronto.

"Acadia" Lime-Sulphur Solution

Manufactured right in the fruit growing district to supply the needs of this Valley. Although this is the first season "Acadia" brand has been on the market, it is being used exclusively by the best orchardists in Kings and Annapolis Counties. Write at once for price and full particulars to

Cultivate The Old Orchard.

No greater mistake can be made than that of allowing orchards to remain in sod year after year. Nor should we expect two crops a year from the soil when the orchard has reached full bearing age. We often look upon an apple tree as being a deep feeder and hence leaving the surface soil quite fertile and valuable for other crops. The fallacy of such a belief soon becomes evident when we start to plow up the old orchard. A perfect network of rootlets will be discovered right to the very surface of the ground.

When plowing up an old orchard, we should not overlook this fact of so many rootlets being near the surface. Deep plowing might not prove an advantage. It is better to plow as shallow as possible and in this way save the roots from destruction as much as possible.

After the seeding has been taken care of, before that, if possible, it will be a good idea to get into your orchard with a plow; and count on having it cultivated every year. Cover crops of clover, or rape, or other crops to suit the purpose, may be sown later on in the summer when it is desired to check the growth of the tree and ripen the crop and mature the wood for winter.

In early fall, pigs or sheep may be turned into the orchard and allowed to pasture on this crop and to take care of wormy apples and windfalls that might otherwise go to waste and in the case of the former be a nuisance in propagating their kind for another year.—T. R. James in Farm and Dairy.

Head the old Trees Low.

With the certainty that much more attention is to be paid our apple trees than in former years, it is well to suggest that in the pruning this year the old trees be headed lower. This is a simple matter. It only means the cutting out of the top to let in the sunlight and thus snipping off the tips that shoot up allowing those which reach out to remain. The difference between a low headed and a high tree at picking time will be from fifteen cents per barrel in one case to fifty in the other. It is not a question of more apples but of a full crop so grown that it can be gathered at least expense. It is possible by the use of a strong nitrogenous fertilizer for one or two years to make an old tree, practically worthless, all over with a new top. The story of the big Boston Fruit Show is significant here. The great prizes for Spys, Greenings, and other varieties were won on apples which grew on old trees which had been retopped after the manner indicated. It means a little work, a little fertilizer in early spring and the stirring of the soil under each tree.

Keeps out large Animals—Keeps in the Chickens

We've put strength and stiffness into the PEERLESS JUNIOR Poultry Fence so it can stand the attacks of restless animals from the outside. We have made it close enough so small fowl cannot get through. It is made of much heavier wire than the ordinary poultry fence, well galvanized, therefore much more durable.

Peerless Junior the fence that saves expense

That heavy, No. 9, hard steel wire at top and bottom holds the fence taut and true without the necessity of fence boards and saving more than half the usual number of posts. That means considerable saving to you. Write for our printed matter about PEERLESS Fences. We make fences and gates for every purpose.

BANWELL HOXIE WIRE FENCE CO., Limited
Dept. K — Hamilton, Ont. Winnipeg, Man.

"VANCO" Brand

Spray Chemicals

have a uniformly high strength which you can seldom, if ever, get in home-made mixtures or other commercial sprays. They are prepared by expert chemists, from the purest chemicals, combined in exactly the right proportions to make safe and effective sprays.

We make all our Sprays right here in Canada, and ask for business not on promises, but on records of Government analyses and practical tests.

"VANCO" Lime Sulphur Solution

contains a maximum amount of active sulphur, without any useless sediment. With it you can eradicate scale, scab, blight, mildew, aphis, bud moth, and all parasitic sucking insects and fungi.

One barrel makes 12 for spring or 50 for summer spray. Price $8.00 per bbl., f. o. b. Toronto.

"VANCO" Lead Arsenate

kills leaf-eating insects more effectively than Paris Green, sprays easier, sticks better, and never burns the foliage. It contains 15% to 16% Arsenic Oxide and only 40% moisture average.

Price 10c. to 13c. a pound, according to quantity.

Club your orders and save on freight

EWING'S

EWING'S RELIABLE SEEDS MONTREAL

For Bumper Crops

You need more than good land, plenty of fertilizer, careful, intelligent working, and favorable weather—**you need good seeds.**

"Like produces like," and all the natural advantages in the world won't make old, half-dead seeds, or seeds of an inferior strains, produce first-class crops.

But plant Ewing's Seeds, give them these natural advantages, and you'll get crops that will gladden your heart and fatten your bank account.

Ewing's Seeds are grown from selected plants, the strongest and healthiest of their kind, and for forty years they have in turn been growing bumper crops. Thousands have proved them thoroughly reliable.

Don't take chances on doubtful seeds—insist on Ewing's. If your dealer hasn't them write for our Illustrated Catalogue and buy from us direct. Write for the Catalogue anyway.

Wm. Ewing & Co., Seedsmen, McGill St., Montreal.

Reliable Seeds 6

Georgian Bay District Apple Output

The Georgian Bay district put up 166,000 bbls. of apples last year, reports A. Gifford, "and the equivalent of 46,000 bbls. more in the form of evaporated stock. The barrelled apples averaged $1 per bbl. net for firsts and seconds, while the culls netted 45c. Our own orchard was sold at $1.65 for firsts and seconds but in this case we did the picking. In the case of well-sprayed orchards 75 per cent. or 80 per cent. of the fruit was No. 1, while only about 30 per cent. graded No. 1 where spraying was not done.

Facts Worth Knowing About the Frictionless Empire

Here are a few facts about the Frictionless Empire that are worth knowing if you are in the market for a cream separator:

Frictionless Empire has **fewer wearing parts** than any other cream separator. It is the **only** cone-method separator with **ball bearings** at top and bottom of bowl-spindle.

Requires so few drops of oil per day that **no oil cups** are put on the machine.

Skims to a **trace.** The six smooth cones are as easy to clean as an equal number of glass tumblers.

The height of the supply can is just right. The grip clutch allows separator to be **started without effort** and to reach full speed in a few seconds.

Doesn't spatter oil or milk—the clean separator, with anti-splash one-piece steel supply tank.

The foregoing brief facts are explained fully in our **New 25c Book.** The most unbiased book on cream separators ever published. Tells **the truth about the two standard methods** of cream separation. We will send you **one copy free,** provided you tell us the number of cows you keep. Also name of the publication in which this ad. appears. Don't miss this interesting book. Ask for book No. 56

The EMPIRE Line of Cream Separators

All sizes of both cone and disc machines in the Empire Line. Every Empire backed by **a guarantee as good as a gold bond.** Even if you buy another make of separator now, you'll never be contented until you own a **really good separator. Some day you'll own an Empire.**

There is an Empire dealer in **almost** every town in Canada. If there isn't one in **your** town write us direct for special offer. 5

THE EMPIRE CREAM SEPARATOR COMPANY OF CANADA, Limited, Toronto, Ont., SUSSEX, N. B. WINNIPEG, MAN.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Starters.

The valuable starter is no longer a debatable point. In sour butter creameries a starter is invaluabie, because the demand of our market is for "special" butter, and if we do not give the consumer a first class article he is going to use a substitute for less money.

By using starter, fermentation is largely controlled, and when fermentation is controlled a good flavor is practically assured.

The practicability of the use of starter has been demonstrated, for we find it in our best and most successful creameries.

I shall consider five requisites for successful starter propagation.

Frst and most important, the operator or propagator must be capable. He must be careful, and he must know the difference between not only a good and poor starter, but he must be able to distinguish between a good and a medium one. He must be a student at his work, for a new problem continually arises. The methods used by one man cannot be copied eactly by another working under different conditions.

This should not be discouragiug to the beginner, but rather the opposite.

The other requisites can hardly be named in order of importance.

Second. Careful selection of seed. The necessity of this is obvious Good seed can be gotten from dealers who handle the commercial starter. This is not all, however; in the transferring from one culture to another the the ripened starter must be examined carefully. The curd should be smooth and custard-like in appearance. This point is reached just as the curd forms. Gas pockets must be absent, and the flavor of a clear, mild acid nature. After the curd is examined the starter should be agitated, some poured out into a cup or dipper, and further examination made from this, and not from the original starter receptacle. The smell should be carefully noted, and at least a teaspoonful placed in the mouth for examination of the flavor. It is desirable to have about 70 or 75 per cent. acid.

Third. Preparation of the seed bed. This seed bed may be either whole or skimmed milk. Whole milk is a little more easily selected. If, however, the starter is lost whole milk is rather expensive.

After the selection of good milk, the undesirable plant must be weeded out. This is done by pasteurization. The methods used in pasteurization vary a great deal.

I was surprised when I came to New York State to learn of the high temperature used, also the long time employed. However, I suppose that I should not be surprised, for when I came here I heard for the first time the expression "farming it." Out in Indiana I heard the expression "right smart." In different localities various expressions and also different methods of work are used.

Now regarding pasteurization. In "The Preparation of Starters," by Elov Ericsson, under date of November 12, 1909, we find these words:

"The milk should not be pasteurized more than so as to have it sufficiently pure for starter. A temperature of 190 to 195 degree for 30 minutes is ample for destroying all germs in vegetative state, In order to destroy the spores, either a temperature of 250 degree for 20 minutes, or heating to 200 or 210 degree for 20 minutes for three successive days is necessary."

Prof. F. W. Bouska in Bulletin 103 of the Iowa Experiment Station, under days of March, 1909, says:

"In pasteurizing milk for starters it is best to apply the heat for thirty to sixty minutes. A temperature of 150 degrees F. kills all the sporeless bacteria. Higher temperatures, up to 212 degrees F., do not kill the spores, but they are so weakened by the higher heat that they germinate more slowly and their harmful effect is retarded. This fact, and the results of experience, indicate a temperature of about 185 to 200 degree F. as best. The heating and cooling can be done in cans immersed in water. Stirring hastens the process, but it is not necessary when the heating surface is not hotter than about 200 degreef F. Where the heating is done by steam, stirring is necessary to prevent scorching."

In Bulletin 181 of the Wisconsin Station, dated September, 1909, we find the following by Prof. E J. Hastings:

"The plan of heating the milk three times in three successive days in order to destroy all the spores is not necessary. It involves much work and injures the milk for starter making purposes. The less the milk is heated the better soil it seems to be for the lactic acid bacteria. As mentioned above, the spores are not to be looked upon as a source of contamination. Since they do not have an opportunity to grow in the milk seeded with lactic bacteria, they will rarely cause the deterioration ot the starter unless the milk used is old and dirty, and hence contains a large number of spores."

In the phamplet on A Treatise on Starters, by Martin H. Meyer, formerly an instructor in butter-making at Wisconsin, and published by Chr. Hensen's Laboratory, under date of October, 1909, we find these words on page 10:

"Set two vessels each containing one quart of milk into water and heat it to 170 degrees F. to 190 degrees F., and hold it this temperature for about forty minutes. Cool quickly to 80 degrees F., and it is then ready for the addition of the pure culture."

Also on page 20:

'Heating the starter milk twice to about boiling point has a very detrimental effect on the quality of both the milk sugar and the lactic acid. There are more starters spoiled by overheating the milk than many butter-makers imagine. The milk invariably takes on a brownish color when overheated. This indicates that the milk sugar has caramelized by reason of having been scorched. By changing the condition of the sugar, an inferior quality of lastic acid is produced. It is only natural that when the milk sugar is scorched, the starter will have a burnt flavor. This flavor is also imparted to the butter by use of such a starter and it destroys the fine "bouquet" so desirable in butter. Such a starter is usually spoken of as a pink and brown starter and as having a scorched or burnt flavor."

In the Michigan Bulletin No. 246 dated June, 1907, by L. D. Bushnell and W. R. Wright, we find:

"If a large can of recently pasteurized milk has been cooled below 100 degrees F., the contents of the jar from which the transfer was made may be emptied into it, thus completing the work of preparing a starter for use on the following day for ripeding large quantities of cream. By this method only a quart of milk out of a large can of starter has been sterilized, a quantity too small to be detected in the cream or butter."

It seems that our literature on starters is not favorable toward high pasteurization to such an extent that the starter is cooked or burnt. However, I learn through Mr. W. W. Griffith and Mr. W. E. Ayres that the high pasteurization temperature is very common in New York. Yesterday I learned from Mr. White that this method is being used elsewhere.

Personally I ahould like to see this tried out under some conditions. If the burnt flavor leaves the butter within a few days as I hear is true, and the butter is just as good as made from lower pasteurized starter and milk can thus be used for starter which otherwise could not be used, it is a great step in advance in starter propagation. However, it seems to me that this is an extreme method, and should not be used unless necessary. If the starter milk is good and low pasteurization is effective, why use the longer and more expensive method? On the other hand, if the operator has difficulty, and high temperatures cure that difficuliy then use the high temperature. While doing some extensive work in Ohio I had occasion to drive out past a little country church. In the evening I learned its recent history. The people had had a division of belief, and the congregation was split up. The old line clamed that the devil had two horns, the conservatives claimed that he had only one, and the progressives said that he was a muley. I do not know that it makes so much difference whether the devil has two horns or none. In other words I do not know that we need to discuss this question. However, I wanted to bring out the fact that there is a difference of opinion regarding pasteurization.

Fourth. Care in method, and amount of inoculation. It is obvious that the propagator must be careful to do the seeding in a quiet and clean place. He must beware of contamination.

The amount of inoculation varies with the temperature used. Usualiy about 1 per cent. or two per cent. is used; 6 per cent. to 10 per cent. is used by some. I have thought that I have been more successful with the larger inoculation and the lower temperatures.

Fifth Ripening and holding temperatures. Temperatures from a little above 60 degrees F. to 75 degrees F., seems to be within the zone of greatest relative growth of the lactic acid plants. When the lower temperatures are used, the starter is more readily cooled to the holding temperature. Over-ripeness is more likely to occur when the high temperatures are used than when a temperature of 62 degrees F. to 65 degrees F. is employed. And we must remember that the over-ripe condition is very undesirable.

Starter should not be held longer than a few hours. However, it may be held a day or so at a temperature of 40 degrees F. to 50 degrees F. It is claimed that lower temperatures put the bacteria in a dormant condition, and thus they are not as active when first scalded as they should be.

I have only broken the ice in this subject which so vitally concerns the greatest factor in butter-making, i. e., flavor.

E. S. GUTHRIE.

Foundation of Successful Dairying.

Perhaps the first important factor to consider in dairying is the stable wherein the cattle are to be housed. Economy should first be considered, nevertheless this should not deprive the owner from establishing the proper conditions for the betterment of the herd to be housed therein, keeping in mind the necessity of plenty of sunlight, proper ventilation, cement floors, proper drainage, comfortable ties etc.

As to the breed of cattle, this can best be determined by the contemplating purchaser, which fact he alone can determine from the standpoint of quantity or quality of milk required by his market, some dairy breeds giving large quantities of milk while little butter fat, while others give less quantities of milk with more butterfat, but regardless of this point in view he should first consider the animal from the standpoint of health, ascertaining as to whether or not it is free from tuberculosis etc. and under no condition should any animal be introduced that is not in perfectly healthy condition.

Consumption Book FREE

This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1554 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

A Woman Who Sees This Washer

will want it right away. The "Puritan" takes all the work out of wash day—in fact, it does away with wash-day because a big family wash can be done in an hour. Improved roller gear and other exclusive features mean quick, easy washing.

Churning made easy with the "Favorite" Churn—a national favorite.

If your dealer does not handle these two labor-saving devices, write us. 68

DAVID MAXWELL & SONS, - ST. MARY'S, Ont.

Salt for Dairy Cows.

Several years ago the Wisconsin Experiment Station carried on some extensive experiments to determine the value of salt for milch cows and also the amount of salt that should be given. We do not have space to go into details of how this experiment was carried on, but we quote the summary of their findings along this line :

In every case the cows exhibited an abnormal appetite for salt, after having been deprived of it two or three weeks, but in no case did the health of the animal, as shown by the general appearance, the live weight, or the yield of milk appear to be affected, until a much longer time had elapsed. This period of immunity varied with individual cows from less than one month to more than one year.

In every case there was finally reached a condition of low vitality in which a sudden and complete breakdown occurred from which recovery was rapid if salt was supplied. This stage was marked by loss of appetite, a generally haggard appearance, lusterless eyes, a rough coat, and a very rapid decline in both live weight and yield of milk.

The breakdown was most likely to occur at calving or immediately after, when the system was weakened and the flow of milk large. In general, the cows giving the largest amount of milk were the first to show signs of distress. They all suffered less in pasture than when confined to the stable.

The behavior of the cows in these trials indicates that their food contained sufficient chlorine to maintain them in good health, while dry, for an indefinite period and it seems probable that, under conditions existing in Wisconsin, a dry cow or steer would suffer no great inconvenience if given no salt, except that contained in the normal ration. It is calculated that the ration given in these experiments contained chlorine equivalent to about .75 of an ounce of salt per day, and it is assumed that this is the minimum amount of salt required per 1000 pounds, live weight, to sustain an animal that is not producing milk. If this amount is not present in the food, it should be supplied directly.

In addition to this a cow should receive enough salt to compensate for the chlorine contained in the milk produced. In general, this will require about .6 of an ounce of salt for each 20 pounds of milk given. A slight excess will do no harm, and it is recommended that dairy cows in Wisconsin be given at least 1 ounce of salt per day. Exceptionally heavy milkers will require more than this.

The uniform results obtained with all cows employed in these trials indicate beyond question that in Wisconsin, and in other regions similarly located, salt, in addition to that obtained in the food, is absolutely essential to the continued health of a dairy cow, while producing milk.

It is evident, moreover, that the amount of salt which must be supplied directly, will vary greatly in different localities, it being more at high elevations and at places remote from the sea.

The success of these experiments must be chiefly attributed to the exceptionally long periods during which salt was withheld. In no previous tests, so far as the writer knows, have cows been deprived of salt for more than thirty consecutive days, which period is shown to be entirely inadequate, under conditions which exist at this station. The twenty-three cows that were deprived of salt in our trials all continued for more than sixty days and several of them for more than six months before any noticeable effect upon their physicial condition or yield of milk occurred.

Mold Prevention.

Judging from the letters we get at the college it seems to me that moldy butter really merits more attention than it receives. I believe a great many buttermakers have incorrect ideas as to the score of a large amount of moldy butter. If we are to prevent mouldy butter we must pay attention to the sources from which mold comes. We have our mothods of treating the tub so as to destroy the mold spores that happen to be in the tub.

One of the incorrect ideas which many have as to the cause of moldy butter is with reference to the refrigerator. Last winter we received many letters, one creamery especially saying that the year previous they had a large amount of trouble with moldy butter but they thought it was from their refrigerator. They took out the old refrigerator and installed a first class new one. Now, gentlemen, the refrigerator itself is not going to cause moldy butter. You may have a refrigerator that is so damp that mold will grow on the walls, but that isn't likely to cause mold on butter. Mold comes from mold spores.

For instance, a source of mold to which the buttermaker does not devote attention at the present time is the paper and wrappers. I am certain that the paper itself may be just as much a source of trouble as the tub unless it is in good condition when used or treated in some way to destroy the mold.

You all know the conditions that favor mold growth. One is an abundant supply of moisture. Another thing we have to have is air. The third thing is some food malerial. Mold will grow on practically anything, but the kind we find depends upon the material itself. On paper, instead of having a mold that is greenish in color, we have one that is black. The mold plant which we get on ordinary material is colorless and only when it produces the seeds does it produce color. The plant on butter is black. There are always more or less mold spores on liners and wrappers. Whether we get into trouble with these depends on how we store that paper after it comes to us. When we store butter in a clean and dry place it can't grow, but as soon as we put the paper in a damp place so that it will gather moisture we will have trouble.

The mold we get on our butter does not grow on the butter itself. It grows very largely on paper. Butter is not a good food material for our ordinary mold, but when we bring that paper in contact with the butter the mold grows on the paper quickly and penetrates into the butter. In tubs it grows on the wood and then on the butter. When we place butter in tubs, especially in unparafined tubs, the moisture is taken up by the tub and the butter shrinks, leaving an air space which is a good place for mold to grow.

I think that the points, which I have mentioned are the most important from the standpoint of the buttermaker. Where the stock is held at a low temperature—below the freezing point—of course that stops the growth mold. When it comes to treating the paper that seems to me to be of very much less importance. You can treat the paper in a number of ways. If you soak the paper in brine for a considerable period, possible you would not have much trouble. Brine is not half strong enough to kill mold spores. If we treat paper with some great agent that is strong enough we will likely prevent all trouble. Soak your paper in lime water. It is perfectly harmless. The only thing is to use perfectly fresh lime. By soaking the paper in that for two hours we will destroy very largely the mold spores. The great advantage in using lime is the fact that it is cheap.

Another thing which can be used, and which is stronger than lime, is hydrogen peroxide used in a 10 per cent. solution. The disadvantage there is the expense. It costs 25c. per pound.

Another way which can be used is simply treating the paper in hot water. Place the package of wrappers in a pan and bring the water up to a boil. That does not injure the paper at all and puts it in a good condition to use on the butter.

I want to emphasize that the most important thing for the buttermaker to do to prevent mold, is to be careful where the paper is stored.

The question is asked how are we to test paper for mold ? I will say that we simply put samples of the paper in conditions that are favorable for mold growth. Put it in a pan and cover it over with another pan.

A great many creameries wrap their butter with moist paper, but butter that has been treated with boiling water will dry quickly.—PROF. E. G. HASTINGS' address before Wisconsin Buttermakers' Convention.

Dairy Notes.

It is a dead loss to allow milk to sour before skimming unless the cream can be churned at once.

Absolute cleanliness is essential about the dalry and any departure from this is detrimental to the product.

When we feed the cow a variety of grains we come nearer to feeding an evenly balanced food than if we fed only one kind.

Nothing sold from the farm improves it so little as butter. Hence it comes that it pays better than any other product.

FORESIGHT

Means Provident Care for the Future.

Is it FORESIGHT to WASTE money on a FLIMSY CREAM SEPARATOR because it is a LITTLE LOWER in PRICE? It may skim for a SHORT TIME, soon GETS OUT of REPAIR and is READY for the SCRAP HEAP in a YEAR OR TWO.

"Care for the future," means, select the STRONGLY BUILT MAGNET made by the CREAM SEPARATOR SPECIALISTS, the

PETRIE MFG. CO., Ltd., Hamilton,

whose GREAT SUCCESS has been attained by building this Cream Separator superior in every way to all other separators.

DO NOT TAKE our word for it, BUT COMPARE it, point by POINT, with any or all separators and you will find EACH PART in the MAGNET STRONGER and BETTER ADAPTED for doing the WORK FOR YEARS than the parts IN ANY OF THE OTHERS.

The MAGNET Skimming Perfectly sitting on the rough PRAIRIE
THE SQUARE GEAR AND DOUBLE SUPPORTED BOWL DOES IT
STEADY AS A ROCK

Here are the points :—

1st The square gear construction.
2nd. The strong and rigid frame.
3rd. The double supported bowl. (MAGNET Patent.)
4th. The skimmer in one piece takes out all foreige matter leaving perfectly pure cream.
5th. Perfect skimming, the advertised capacity.
6th. Easy cleaning, clean within five minutes.
7th. Change of capacity in the same stand for a few dollars.
8th. Perfect brake. Saves time. (MAGNET Patent.)
9th Sanitary strainer on tank. (MAGNET Patent.)
10th. Safety. All parts covered
11th. Skims standing on the ground or any floor.

Our GUARANTEE COVERS EACH and EVERY POINT. Send for Catalogue.

Free to every Dairyman. Department E, under the management of a Graduate, will answer all inquiries in regard to Dairying, free.

Our 12 years' experience, as Dairy Specialists, is at your disposal.

The Milk Supply for Towns and Cities.

The milk supply for towns and cities is a question that is receiving the attention of scientists the world over. Much agitation for a pure milk supply has taken place in many cities and towns in the Maritime Provinces and elsewhere. The demands are universal and the production of a sanitary article must be the result.

Mr. L. A. Gibson, Milk Inspector, Winnipeg, has the following to say on the question, in a recent issue of the Nor'-West Farmer—the conditions that obtain in the west are also applicable to the east:

"The Manitoba Dairy Association has for many years discussed the production of milk for the manufacture of butter and cheese. But the idea of making a separate study of city market milk is something new. Why is this! In the advance of the human race and the progress of science new light is being shed on dairy matters, because the newest of all sciences, bacteriology, has shown that many diseases are caused by a specific germ or seed; no seed, no crop, whether of wheat or typhoid fever. Of late, bacteriologists have turned their attention to market milk, and have found it a favorable medium for conveying the germs of disease because when people live in cities under more or less unnatural conditions, their powers of resistance are weakened, and the disease germs may find more favorable places for germination and growth than in the country. Hence the increased attention now being given all over the country to the proper preparation of market milk.

The study of bacteriology has shown that milk may contain and convey to human beings seeds of tuberculosis, typhoid fever, scarlet fever, digestive troubles and other physical disturbances. As milk is the exclusive food of many babies, the result of using milk that is impure is most strikingly manifested in facts relating to infant mortality. How shall we prepare city milk, or any other milk, so that it may be a safe article of food, especially for children? First, have healthy cows. Milk from cows with feverish conditions, inflamed udders, should not be used for human consumption. The recent International Tuberculosis Congress, composes of the world's best authorities and experts, expressed the unanimous opinion that tuberculosis can be transmitted from the bovine to the human race. It therefore follows that cows producing market milk should be free from tuberculosis.

"The dairymen of this province are face to face with the serious problem in this respect. It is true that to-day from thirty to fifty per cent of the cows in Manitoba are affected with tuberculosis. This is a very serious state of affairs. I have great faith in the tuberculin test for diagnostic purposes. But I am not in favor of compulsory testing for the reason that unless you have public sentiment behind these laws they are of very little account. The main question is one of education. First of all, we require a great campaign for more sanitary stables with an abundance of light and ventilation. Unless we have these the testing of cows will do little good. Common sense says: "Clean up your barns, let in more light and ventilation." This campaign should be carried on by the provincial government throughout the province by means of addresses, printed bulletins, and post mortem examination of tubercular animals. Get the public thoroughly aroused to the necessity of fighting the disease. Then, too, the consumer requires to be educated to pay an extra price for better quality of milk.

"Contagious diseases: No person should have anything to do with a milkman who has any contagious disease or when any disease exists among his immediate associates. In the city of Winnipeg in 1908 two outbreaks of typhoid were due to accidental infection of milk, one consisting of twelve cases and another of twenty-six. To avoid infection of milk from contagious diseases, take precaution in regard to the health of those who handle the milk, Sterilize bottles and utensils every time they are used. Keep flies away from milk and from everything with which milk will come in contact.

"The third, and by far the most common, form of contamination of milk is with bacteria which are not the germs of any specific disease, but which can upset the weak stomach of a baby or invalid, causing cholera infantum, dysentary, and other forms of disorders. These germs are intimately associated with filth. Clean milk contains few bacteria. The more dirt and foreign matter milk contains the more bacteria and the more varieties of bacteria it will contain.

"Remember that most of the contamination of milk comes from dirt in the air; that all air contains some impurities constantly settling in every exposed substance. Hence, milk should be exposed to the air as litttle as possible and what exposure is necessary should be in air as clean as possible. In order to meet these requirements, provide yourself first of all with a small top milk pail. An opening one-half the usual size will keep out one-half the usual amount of dirt. Then, the cow should be clean. She should be brushed, or groomed daily. The long hairs on the udder should be clipped and the udder itself should be carefully washed before milking. The milker should wash his hands before sitting down to milk and should wear a clean suit while milking. The stable should be kept clean from dirt and cobwebs, and whitewash should be frequently used. When a cow has been milked, the milk should be removed immediately to a clean milk room, with a good cement floor. The milk should be promptly strained and run over a cooler. A word as to straining:

"I have heard producers brag about straining their milk through twelve thicknesses of cheese cloth. Dirty milk cannot be purified by straining. An occasional hair or straw may accidently get into the milk in spite of the greatest care, so some straining is necessary But much of the dirt that gets into the milk is soluble and goes through the strainer. The gospel of clean milk is not a strainer gospel, but a gospel of prevention. The importance of prompt and efficient cooling of milk can not be overestimated, as bacteria multiply rapidly when warm, but cease activity when cold. The ideal way of handling milk is to cool it to fifty degrees Fahrenheit promptly after milking; then bottle or can at once and cover promptly. Don't leave the cans uncovered under the mistaken idea that this is necessary in order to allow the animal odor to escape. Clean milk has no animal odor. Finally, store the mllk where it will keep cold till delivery.

"A word in regard to delivery: The cleanest and best way of delivering milk is in glass bottles, provided you have proper apparatus for washing and sterilizing the bottles; if not, they are liable to carry disease from one house to another. Another source of contamination is the milk utensils. When made of tin, utensils should have no crevices or seams, which are hard to get at in washing. A superficially clean pail or can may be disgusting when you examine the seams. A liberal use of solder should render the inside of all cans or pails smooth and cleanable. Rusted tinware should be avoided.

"To get a proper milk supply, a campaign of education must come first. Consumers must know what to demand and be willing to pay a good price for superior quality of milk. They must also know how to care for the milk after they receive it, as much milk is spoiled after the consumer receives it, on account of not giving proper care. Producers must know how to supply the demand, as this is a very important industry and requires the greatest attention possible, as a better quality will increase consumption. The cities and towns of this province use each year 63,700 quarts of milk, valued at $1,628,800. By close attention to all details, this amount should be doubled in a few years. It behooves the milk producer to read the signs of the times and so improve his product that he will not fear coming legislation, which, on the ground of public health, may be expected to exclude much of the milk now sent to the market. It is one of the functions of the Dairy Associations to push the educational phase of the work, to explain these "signs of the times" to milk producers, so that the progressive ones may voluntarily clean up and practice satisfactory methods. This Association can, in this way, be of great assistance to Manitoba producers, who should loyally support it."

It is No Longer a Question Does a Separator Pay?

THE QUESTION IS—

What Kind Shall I Buy?

Drop a postal to our nearest branch office and get THE CAPITAL book. It tells you some FACTS worth knowing about separators—how THE EASY RUNNING CAPITAL will "BUY ITSELF" for you—THERE'S THE ANSWER—

The Capital Separator

with it's close skimming, "easy to wash" bowl, weighing less than four pounds, gets you all the cream.

Straight Talk on Cow Care.

M. H. Gardner, superintendent of the advanced registry for Holstein cows in the United States, in a recent circular, offers some open advice to a beginner with the breed that is worth passing on. The advice was intended primarily for advanced dairy farmers, but it deals with the principles that are at least so much alike on every farm, that no one could tell the difference. The enquirer asked, "How long before the beginning of a test does the owner begin to prpare for it?"

Mr. Gardner, in his reply, says: "No direct answer can be given; it depending upon the owner, the cow, and the circumstances. The object, however, of admitting cows to advanced registration that have proved their capacity and value by making good under official test and bulls that are the sires of such cows, is primarily for the improvement of the breed; and the success of any test will depend upon the hereditary vigor and capacity of the cow, on her proper development, and on the skill of her handler.

"That a cow shall have vigor and capacity of development, she must be well born; and to be well born, she must have strong, vigorous parents. Thus, it will be wise to begin to prepare for the test before either sire or dam are born. If the grand-sires and grand-dams, being good animals individually have been liberally fed from birth, so that at mating time they are vigorous and of full size for their ages, and the cows are so fed during pregnancy as to be able to properly nourish their unborn calves, a strong and healthy sire and dam may be confidently expected; and the repeating this process, as to care and feed, with sire and dam, will produce the animal herself.

"If the grand-dams and dam have their natural capacity for milk production fully developed, so much the more likely is it that the animal will have a greater inherited capacity; and with an animal so bred, the owner has his material for development. The results of the test will then depend upon care and feed from birth up to fullest maturity.

"All the requirements in successful dairy husbandry can be boiled down into just care and feed; but both must be of the right kind. No animal that is not kept in a warm, clean, well ventilated stable in winter, or is allowed to fall off in flesh and milk in summer, because of short pastures and torment from flies, can be regarded as having the right care and feed. Negligence in summer is more frequent among breeders of dairy cattle than it is in winter.

"The main dairy problem is the problem of right feeding; the man who deprives his cow of feed for which she will give him a return in either growth or milk is the opposite of wise, for he depletes his own purse. No cow that has been stunted in growth can in the nature of things attain to the point she might have reached; yet the proportion of undersized cows in pure bred herds, to say nothing of the common dairy herds, is entirely too large. Give the cow a chance, then if she does not make good, send her to the block.

Blood Was Bad.

From impure blood comes Pimples, Boils, Ulcers, Tumors, Abscesses, Festering Sores, Rashes, Constipation, Headaches, etc.

Get pure blood and keep it pure by removing every trace of impure morbid matter from the system by using

BURDOCK BLOOD BITTERS.

Mrs. Fred. Biggs, Kingston, Ont., writes:—"I was completely run down, my blood was out of order, and I used to get so weak I would be compelled to stay in bed for weeks at a time. I could not eat, was pale and thin; every one thought I was going into consumption. I tried everything and different doctors until a friend advised me to use Burdock Blood Bitters. I did not have one bottle used when my appetite began to improve. I used six bottles. I gained ten pounds in two weeks. When I began to take it I only weighed ninety-three pounds. It just seemed to pull me from the grave as I never expected to be strong again. I will tell every sufferer of your wonderful medicine."

For sale by all dealers.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Chat About Butter.

"Just take enough space in your 'gossip column' to tell the butter makers that the time has come for them to reduce the amount of coloring matter that they are using in their butter,'" remarked a prominent operator. "The season this year is so early that the cows are already getting a bite of grass, and this gives more color to the butter. Several lots in the past week were highly colored, and unless the matter is given attenton at once we shall have so much of this over colored stock on our hands that we shall not know what to do with it. Emphasize the fact that the best trade wants light colored butter. I don't mean by that chalk white though a few customers like such—but a delcate, light straw shade that has life in it. Such lots suit almost anyone. Now and then a buyer has trade for goods with more color, but this is the exception. You cannot make these points too strong, and now is the time for the butter makers to get busy."

"Accidents happen in the best regulated families," is a familiar expression that is full of meaning; and some strange things occasionally happen in some of the best families. Some two weeks ago I was asked to look at a shipment of butter that arrived that day from a western creamery—one of the best that comes to this market. The color was simply dreadful. Talk about barber poles, why they aren't in it with the appearance of that butter. We bored tub after tub and the trier showed a layer of very light color and then a layer or roll of almost red butter—enough coloring in it to taste very badly. What would otherwise have been a fine product, was ruined for table use and the whole shipment sold as packing stock at a loss of 10c. a pound. Several experts studied over the problem, and the conclusion was that the butter maker forgot to put the coloring in the cream before churning, and he discovered his mistake after the butter came. Effort was then made to color the butter, but it did not mix in satisfactorily and the entire churning, which was a good sized one, was very seriously damaged.

I am inclined to think that there are a lot of new butter makers in the creameries this spring, and some of them are not up to the best methods of packing their butter. Some of the defects that result from neglect or lack of knowknowledge are not serious, but they contribute to the appearance of the stock, and if the price is not affected a sale may be interfered with. One of the things that need attention is the proper lining of the tubs with parchment. Not infrequently I see a lot where the paper has been folded over so much on the bottom that no paper shows on the sides. No one would know that the tub was lined unless the butter was turned out. Others but the linen cup cloth on top before folding over the paper, and if a lot does not sell readily and has to be shown several times the edges of the paper becomes torn and the appearance is unfavorable. This latter complaint is so frequent that I want to call special attention to it. After the tub is well filled the paper lining should be folded over the butter about two inches, and then the linen cap cloth put on. This permits drawing back the cloth so that the butter can be bored without disturbing the paper. Keep constantly in mind the fact that a handsome appearance counts a great deal in almost any market.—N. Y. Produce Review.

Seventy Pounds of Milk Per Day.

In this busy age, when Canada is making a name for herself with big things, waterpowers, timber limits, railroads, real estate deals and so on, it is perhaps as well to remind ourselves that the ordinary farm operations occasionally show very big things. We hear now and then of poor cows and low yields of milk, so we need constantly to bear in mind that huge things are accomplished by the proper combination of the brainy dairyman, good feed and the selected cow. We have plenty of good cows in Canada, some that give 10,000, 15,000 and 20,000 pounds milk in a year. One or two big records were made in March by excellent cows, one lot of six in one herd giving a total yield of 9,388 pounds milk, and some giving as much as seventy pounds of milk in one day; think of it, enough to supply the needs of 56 ordinary people, at the rate of one pint each. Such cows are not picked up every day, they are not average cows, but they are an indication of what is being accomplished by brain work, applied intelligence in dairying. We need to realize that it is perfectly feasible to do a good deal more raising, not only the much needed raising of the general standard of the average cow, so that the 3,000 pounder is no longer "in our midst," but the raising of a good many more cows of at least the 10,000 pound type Dairy records, of milk produced and feed consumed will soon show which cow in the stable of the average dairyman is not worth keeping, and which will respond to more liberal feeding, so as to produce milk in abundance. Cow testing associations will help every dairyman to success; join the nearest to you or assist in forming a new one.—C. F. W.

Seven Stones in Herd Building.

1. MILKING CLEAN.—To obtain all that a cow can give, and to prevent early drying off.

2. THE USE OF PURE BRED SIRE.—From strain of large producers, to acquire good qualities and perpetuate dairy tendencies. Of what value is a "scrub ?"

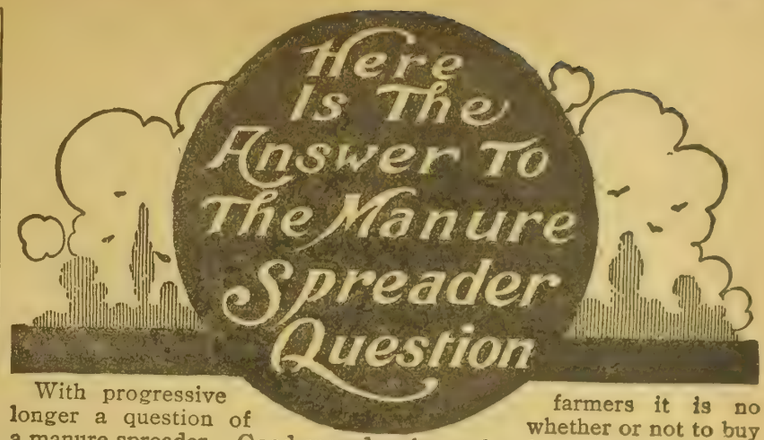
3. REGULAR AND CAREFUL FEEDING.—As to time, quantity and quality; adjusting the grain ration to the production of milk and butterfat; to get the utmost value for the foodstuffs grown or purchased.

4. PROVIDING SUCCULENT FEED.—As roots, ensilage and soiling crops, to sustain and prolong the flow of milk.

5. CULLING OUT POOR COWS.—No one wants them either to feed or breed from. Beef them.

6. GOOD CARE.—Including kind treatment, and everything conducive to comfort, cleanliness and health, so as to give the cow an opportunity to work to the best advantage. Better methods, not necessarily much outlay of cash.

7. KEEPING RECORDS.—All the foregoing naturally hinges on records; a knowledge of each cow's performance and capacity is the prime necessity for increasing profitable production, a mere estimate may be far astray and gives no basis on which to work intelligently; guess work is not business-like, but a careful record supplies information of the utmost value at every turn. Record forms are supplied free on application to the Dairy Commissioner, Ottawa.—C. F. W.



With progressive farmers it is no longer a question of whether or not to buy a manure spreader. Good spreaders have already proved their value. The real question is—which one will net you the most profit?

The I H C line answers that question. Among the many styles and sizes, you will find one that just meets your needs.

I H C Manure Spreaders

embody all that is best in manure spreader construction—all that makes for greatest manure profits. They have strength in abundance to withstand the hardest usage; they are simple, sure and steady in operation; they work perfectly with fertilizer in any condition; they are exceedingly light in draft.

I H C manure spreaders are made in three styles; each style is made in three sizes, ranging from 30 to 70 bushels capacity. Corn King spreaders are of the return apron type; Cloverleaf manure spreaders have endless aprons. Two styles of feed are furnished—either ratchet or double pawl worm gear. There is an I H C to suit each requirement—large sizes for large operations, medium sizes for the average farmer, small sizes for orchards, vineyards—for every condition. I H C spreaders have lime hoods to spread commercial fertilizers; drilling attachments to distribute manure in rows. Whatever I H C spreader you buy will pulverize and spread manure or commercial fertilizer perfectly. You will find it durable, and it will net you big dividends on your investment.

Manure is the cheapest and best fertilizer but it must be handled and spread right or most of its value is wasted. You must have an I H C manure spreader to get 100 per cent value out of the manure. I H C spreaders are doubling the crops of others. The one that suits your needs will do it for you.

Running machine at Different Speeds, Results in Variation Tests.

The thickness or density of cream depends upon two things, the centrifugal force used, and the regulation of the cream screw. In the separation by careful force, the milk is thrown to the outside of the bowl, because it is heavier than the butter fat, the latter works in towards the centre and is known as cream; the nearer the centre the bowl the thicker the cream, providing uniform feed and speed are maintained.

Most separators have what is known as a cream screw that has an opening in the centre. When a thick cream is desired the screw is turned in, which carries the opening nearer the centre of the bowl, giving you a thicker cream.

Separators have different devices for the removal of the cream, but in all cases the nearer the outlet is to the centre of the bowl the thicker will be the cream provided the inlet of milk and speed are kept uniform.

The cause of the variations in tests, in most cases, is due to the variation of speed in running the separator, If the machine is run a little slowly or below speed the result is a lessening of the centrifugal force, consequently more milk will be retained in the so-called cream, which will mean a low per cent. of butter fat. In addition to this the separator will not run clean and the result will be that some fat will pass off into the skim milk.

The writer has, on a number of occasions, tested some samples of skimmed milk from different farms from separators that had been sperated at a low rate of speed and found the fat content in the skim milk to average over one per cent., or one pound of butter fat in each 100 pounds of skim milk.

Dairy Notes.

Butter milk destroys the keeping quality of butter.

Churn promptly when the cream is ready to churn.

Nothing else takes account of filthiness and holds to it like milk and butter.

Milk keeps better even in cool weather if cooled at once after being drawn from the cow.

LIVE STOCK.

Quality Principal Factor in Sheep Production.

Nothing else affects the price of mutton, or makes such a wide range of difference between one bunch of lambs and another, as quality. One breeder breeds for high quality and makes a great success of the business, while another breeds sheep just because they are animals with that name and wonders why he does not make much money.

When producing mutton lambs for market, good quality uniformly throughout the lot is required in order that a high price be obtained The day has gone by when sheep are sold in mixed lots of all sorts. At the present and in the future, all sheep and lambs are and will be sold according to their real merit. Medium size and good quality will always bring a better price than the others. Whenever the market goes up, it is this sort that makes top figures and it the market sags a little it is the best that holds good.

A great number of sheepmen have in their sale bunches a few good ones, but to have the whole lot uniformly so is another thing. Uniformity is necessary to have a bunch of sheep bring a good price, and it must be in size, type and conformation. A few big lambs mixed with smaller ones, or the light and loose fleeced ones mixed, or the thick compact ones mixed with long-legged narrow kind, would not be very inviting to a buyer.

The requirements of a sheep buyer are much different than twenty years ago, and it is now for a better sheep, and it is well that it is so.

All who are interested in sheep production today know the vast difference in price between the common sort and the good ones. To produce the very best should be the desire of all who raise mutton sheep. To do this several new practices will have to be introduced. None but the highest class of registered rams can be used, if good results are to be obtained.

The reason that there are so many "fair to good" and "common" lambs on the market is that the breeders behind the scene have been careless in their breeding operations. Grade rams have been used, and the results in the end are most unsatisfactory. A grade ram can never prove to be really as good a breeder as the high class registered one. The grade may appear very well himself, but perhaps his ancestors have been very inferior animals. These undesirable characteristics will be in evidence in his produce. A continuation of this practice means that your lamb crop will soon be a "mixture" and will not sell as well as they should.

On the contrary, if the use of registered sires is continued each year makes your flock better and profits it greater. It is to go against the world's live stock men to say that the use of grade rams is anything to compare with the use of good registered ones. Improvement in the sheep of the world has been brought about by careful breeding, and greater improvement can be made in the future by a more combined effort to do away with the low class sire.

Such use is rapidly becoming a thing of the past, because everyone sees that the most careful man in his breeding operations is the most successful farmer. Yet, at present, there are large numbers of sheep men on the North American continent who use the ram that is easiest to obtain. As long as such conditions exist the general quality of the sheep will not be just what it should.

If you have in the past years, been easily satisfied with a ram, this year get a good registered one and see what the difference will be in your lamb crop. Don t buy a sire from most anyone just because it is registered, but apply to an old reliable breeder and get a good class of sheep with the very best breeding. A grade producer can also pay attention to type because a ram with good type and breeding is the only sort that sires the lot of lambs to be "alike as peas."

Do not think that just because you produce sheep for the market that your breeding flock needs no attention. Apart from the continuous use of good sires it is well to cull the breeding flock each year. Send to the butcher the ewes which have produced the undesirable lambs. Replace them with some of the top young ewes from last year's crop of lambs. By such methods of breeding you would soon have a better and more uniform flock than you had thought of a few years previous—HOWARD A. CHANDLER in Coleman's Rural World.

Sheep on the Farm.

G. E. Day, professor of agriculture, O A. C., Guelph, is a great believer in sheep and in a lecture on the subject said:

"I do not think it would be wise for every man to keep sheep, for the reason that in order to be successful with any class of animals, a man must have a love for them, and if a man does not like sheep he would not be likely to make a success of them. There are several things about the sheep, however, which makes them especially well adapted to occupy a place on almost any farm, and I shall attempt to place these points before you as briefly as possible.

(1) Sheep will eat a great many kinds of weeds which other animals will not touch. This makes them especially vauluable about a farm as a sort of scavenger.

(2) They will live on very poor pasture where many other animals would starve. Their activity enables them to travel long distances in search of their food, and the formation of their mouth is such that they can bite very closely to the ground, enabling them to gather a living from the poorest soils.

(3) Sheep require very inexpensive buildings. Almost any sort of building will answer the purpose so long as it protects them from storms in the roughest weather, and is reasonably dry and free from draughts. There is no farm animals for which cheaper buildings are required.

(4) There is comparatively little labor involved in taking care of a flock of sheep. I do not know of any animal that requires less labor in its feeding and management.

(5) They grind their own grain, which is another factor which adds to the cheapness of their maintenance. They are the best grain grinders which we have, and the weed seeds consumed by sheep are never known to grow afterwards. This is not true of other farm animals.

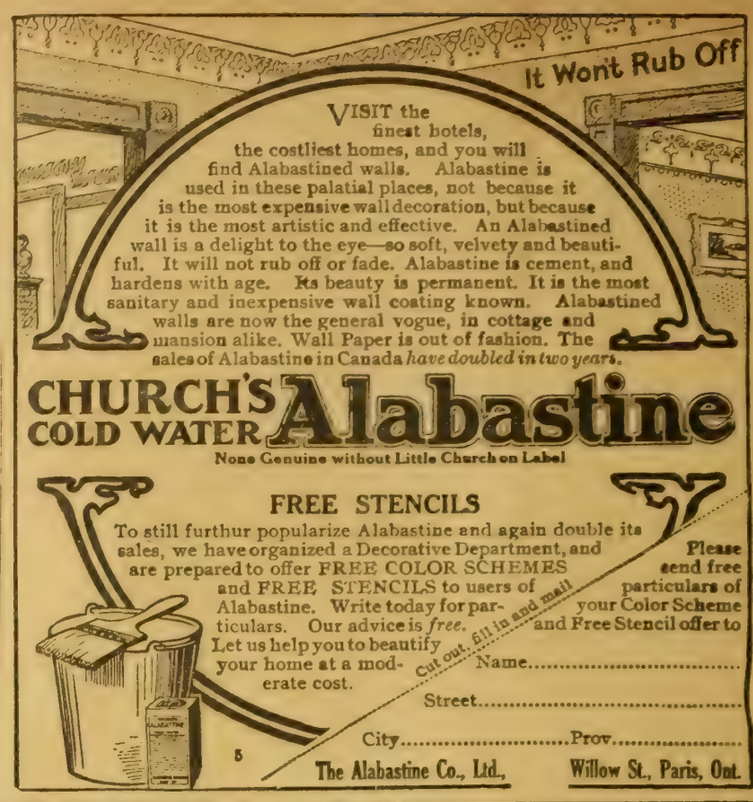
(6) They are economical producers of meat. There has been a good deal of experimental work in connection with this matter, and it is generally estimated that to produce a pound of increase in weight a sheep requires from 8 to 9 pounds of dry matter, in its food, whereas a steer requires some 12 to 14 pounds of dry matter. This shows that the sheep is a very much more economical producer of meat than the steer, and it also compares favorably with the pig, especially during the early period of its growth.

(7) The sheep also gives to products in a year, namely wool and lambs, both of which have a ready market.

(8) While it is true that sheep are more liable to sudden death than some other farm animals, at the same time, the amount of capital invested in a sheep is small and losses of this kind are not serious losses after all.

But while the sheep has so many things to command it, I do not think it would be wise for the average farmer to stock his farm heavily with sheep, neither do I think it wise for him to go to the other extreme and dispense with sheep altogether. The sheep is eminently well adapted to fill in a peculiar place on the farm, making an economical use of products which would otherwise be wasted, and constituting what might be called an important side issue in the business of farming. The cost of maintaining a small flock of sheep is comparativily trifling and the returns they make add materially to the revenue of the farm.

The trouble with many is that if we cannot go into something on a larger scale we do not wish to touch it at all and I believe that if in many cases we had fewer sheep, fewer hens, and fewer hogs and had them looked after better, it would be to our advantage. There is no reason why the sheep should not be increasing the revenue from many of the farms of this Province where at present no sheep are to be found and we believe that the farmer will find the sheep are one of his best friends if reasonable intelligence is used in its management.



It Won't Rub Off
VISIT the finest hotels, the costliest homes, and you will find Alabastined walls. Alabastine is used in these palatial places, not because it is the most expensive wall decoration, but because it is the most artistic and effective. An Alabastined wall is a delight to the eye—so soft, velvety and beautiful. It will not rub off or fade. Alabastine is cement, and hardens with age. Its beauty is permanent. It is the most sanitary and inexpensive wall coating known. Alabastined walls are now the general vogue, in cottage and mansion alike. Wall Paper is out of fashion. The sales of Alabastine in Canada have doubled in two years.

Cuts and Wounds.

Would you kindly allow me, through the columns of your widely-circulated paper, to draw the attention of your readers and brother farmers to the benefits of using powdered alum in cases of cuts and wounds of all kinds on live stock? I could give instances of almost incredible cures from its use, especially on sheep torn by dogs. It is equally valuable for use on horses and cattle. In treating, fill or cover the wound with the powdered alum, which can be had at any drug store for about fifteen cents per pound. Keep it always on hand. It would save the farmers and stock-owners of the world much much loss annually were its value more generally known.

There is also a disease known as joint-ill in colts, which carries off thousands annually, and a similar trouble in calves from infection through navel just after birth. All of such losses can be averted by washing the colts and calves as soon as possible over and around the navel cord, with a weak solution of carbolic acid and some good antiseptic; or if those are not available, rub on powdered alum.

Before taking those precautions I lost several head, especially calves, which generally died with scours in a few days after birth. Since taking those preventive measures we have lost none. I know of no case in which the old adage of an ounce of prevention being better than a pound of cure will be more clearly exemplified. Try it and be convinced.—Farmer, Pictou Co., N. S.

What Does it Cost to Raise a Calf?

This calf was born Sept. 1909 Breed, Grade Holstein.

The grain mixture consisted of 2 parts bran, 1 part cornmeal and 1 part linseed.

The skim milk valued 25 cents per 100 lbs.

The whole milk was 12 lbs a day for first 7 days, testing 6.2 per cent.

Price of butter fat was 33c per lb.

Hay was second quality valued at $10.00 per ton.

COST FOR FIRST SEVEN MONTHS.

	Whole milk	Skim milk	Hay	Grain	Weight	Cost
*27 days	84 lbs.	320 lbs.			108 lbs.	2.48
Nov.		480 lbs.	6 lbs.	3 lbs.	131 lbs.	1.27
Dec.	calf tonic 15c	496 lbs.	31 lbs.	9 lbs.	170 lbs.	1.78
Jan.		480 lbs.	90 lbs.	9 lbs.	211½ lbs.	2.38
Feb.		360 lbs.	120 lbs.	9 lbs.	263 lbs.	1.65
Mar.		366 lbs.	210 lbs.		310 lbs.	1.95
Total	84. lbs.	2496 lbs.	457 lbs.	30 lbs.		$11.51

*First column across is for first 27 days up to Oct. 16th.

Calf had 16 lbs. skim milk a day for the 20 days up to the 16th of October. Whole milk for first 7 days.—A. G. WALKER, in Main Farmer.

Dairy-Bred Beef Animals.

The following from the Tribune Farmer is the summary of an address by Prof. Clinton D. Smith, Michigan Agricultural College, on the dairy breed for beef purposes. The facts cited are interesting, if true:

We turn next to a consideration of the dressed carcass and ask the steers whether, on the average, beef bred animals give a higher percentage of

high-priced cuts than do Holsteins. Here we are forced to find a state of facts existing quite contrary to our preconceived ideas, and, in fact, quite contrary to judgment of the markets—facts which seem to relegate that judgment to the realm of unwarranted prejudice. Let me quote one instance of an experiment conducted at the Iowa Station, in the very heart of the cattle-feeding area of the United States. At this station Shorthorn and Holstein steers were fed, and when fattened sent to the Chicago yards for slaughter and subsequent examination. Let me quote the results of that test from Henry's "Feeds and Feedings," page 377, the work being reported in the Iowa Experiment Station Bulletin No. 20.

Percentage of the various cuts of the dressed carcasses of the Holstein and and Shorthorn steers:

Loins	17.1	16.6
Ribs	9.9	10.2
Rounds	22.9	23.3
Chucks	21.1	21.9
Plates	15.1	14.2
Lnanks	5.7	6.4
Minor cheap parts	7.9	7.4

I submit that these figures indicate no superiority on the part of the beef breed as far as yield in percentage of high-priced cuts is concerned.

Swine Feeding an Art.

By the judicious use of foods, many swine disorders may be prevented or cured. To prevent scours, feed a slop made of crushed oats and barley, after running it through a screen to remove most of the hulls. If put in a small trough in a corner, the pigs will eat it greedily. Every litter of pigs should have a box in one corner containing wood ashes, charcoal and a little salt and sulphur. Fall pigs, that are to make their growth before the next July, have a greater struggle before them, and their rearing demands greater care on the part of the feeder than if they were farrowed in the spring. After removal from the sow, give warm, new milk for the first meal and later, warm the skim-milk and put in a handful of shorts, slowly increasing the latter as the pigs get used to it, until it is as thick as thin porridge. To assist growth nitrogenous foods are essential. For this purpose nothing is superior to oil meal or linseed meal. A quart of it, well stirred in a barrel of the slop, is sufficient. After the pigs are three months old, make a feed of shorts and either crushed wheat or barley. Always let out the pigs to air unless the weather is too bad. If they can have a place to run, where the wind is kept back and the sun pours in, they will prefer to be out-of-doors most of the time while the sun shines. When the swine are five months old, it is well to introduce some corn food, as now they begin to approach the end of their career. Make the mixture of corn, crushed barley and shorts in equal proportions and feed all they will eat clean four times a day. At six months old they should weigh 180 to 200 lbs. each. A few sods dug and stored in the fall and given to each pen occasionally will be eagerly received. The pigs seem to like to work on them and it makes them strong. Thumps, a disease of the heart and digestive organs, is prevented and cured by a loosening diet and increased exercise.

For spring pigs have ready a field that is long and narrow, that the little fellows may be forced to run long distances two and from the feed trough. As soon as the grass is up well put them in, but arrange a dark sleeping place where they may go in frequently and snooze, as all young animals need much sleep as well as exercise, if they do their best. Do not let the sows run with the pigs but keep them in a separate place. The latter must be fed grain as well as grass to keep them growing. Crushed barley and shorts mixed with skim-milk or buttermilk in the proportion of one pound of grain to three pounds of milk is about right for the best results. Only a modest feed three times a day to stimulate the appetite is needed, in fact more should not be allowed, or the pigs will not graze at all and will not do so well. The advantages of grass in summer is that it may be fed in connection with the milk. The size of the pasture will depend upon the growth of the feed and the kind. Clover is the best. If the green feed is seen to be getting short, the pigs should be put in another enclosure for a time. The use of hurdles that new land may be utilized constantly, changing them every week or ten days is a most desirable practice. Such hurdles are easy to make. Each one requires a scantling or pole 12 to 16 feet long, to the ends of which are bolted a cross piece 4 feet long. Now across one side of this great letter I, stretch a stran of hog wire, fastening it securely. Across the other side strain another strand of the same wire and let it be held so securely by the staples that the wire will sing like a violin string, if picked. Here is a skeleton of the hurdle, three sticks bolted together and wire so all is tight. Now cover it firmly with strong net. I have found that poultry net will do for little pigs, but after they are three month old they must go into hurdles made of heavier net. The net must lap on the ground 1 ft. so that it will get tred into any unequalities of the surface and so prevent the mischevious little fellows from working under. These hurdles are kept in place by tying them together on the plan of a Virginia rail fence.

Or they may be kept in shape if wired at each end to a stout stake set in the ground by the use of a crowbar. It is interesting to note how soon a fresh acre may be enclosed by two men when changing the hurdles. Somebody rises up and says, "These hurdles have no bar across the top of the fence." None is needed. If a pig stands up to investigate them, he rests his feet on the long part to the letter I, and above is nothing but the uncertainties of the net. In consequence he returns to all fours and his feed. For lightness and strength there is nothing better.

Why Insurance?

Have you ever considered "Painting" from the standpoint of an insurance policy?

The premium represented by the cost of painting is in proportion to the importance of the security afforded, no higher than other insurance; in fact it is considerably smaller, and soon becomes a minus quantity.

Why Fire Insurance—Tornado Insurance—Lightning-rods? They only protect when that which you wish to avert, happens.

Martin-Senour Paint 100% Pure

affords the utmost protection, insures your property, beginning with its application. It wards off the *sun dogs* of Old Sol, the *nips* of Old Jack Frost—the *ravages* of Old Father Time.

Prevents *dry rot*—checks *deterioration.* No *safer, surer* or *more reliable* insurance could be offered.

If your dealer cannot supply you, notify us and we will gladly direct you to where our paints are to be had.

Weaning Calves.

We have been working for several years trying to find how to wean calves without stunting them. I think we have found something good and would like to pass it along. Our idea is to wean the calf early, when there is plenty of green feed. The middle of August is the best time. We planted a few acres of sweet corn, which we snap and slice shuck and all; they will begin eating this sooner than anything else we have ever tried. By winter they are great lusty fellows, ready for anything. The mother though reaps the main benefit. She has two months of green feed in which to fatten up and get ready for cold weather. Then, as soon as her udder-full of milk, after weaning the calf, is taken up by her system, she will come in season. I think fully 95 per cent. will breed within 10 days.

This you see will bring your calves all before May 25th next season ready to wean by the middle of August again. To show the success of this method, in 1903 from 25 cows we got 22 calves; in 1904 from 28 cows, 28 calves. Through these years our losses have been at least 50 per cent lighter than our neighbors,' for the risk on a fat cow at calving time is almost "nil."—F. L. WINLAND, Franklin Co., Neb.

To Prevent the Growth of Horns.

For several years caustic potash has been used at the University of Wisconsin to prevent calves from growing horns. G. C. Humphrey, Professor of Animal Husbandry, gives the following method, which has been very successful:

The caustic potash should be applied as soon as the "button-like" horns can be felt after the calf is three days old. If postponed, the operation may give unsatisfactory results. To apply the potash, the hair is removed from about the horns, close to the skin, which covers the point of the horns until the skin is white.

It is not necessary to rub the skin until blood comes, as this will cause unnecessary soreness. One such treatment is usually sufficient to prevent the growth of the horns.

The following precautions should be taken: The caustic should be wrapped in heavy paper to protect the hands of the operator; the caustic should not be moistened too much, so that the liquid will run down the side of the calf's head, for this will cause unnecessary pain; the calf must be securely fastened so that the head may be held still to avoid applying caustic anywhere except over the horns. One stick of caustic potash, if preserved in a tightly corked bottle, will serve to dehorn many calves.

Kendall's Spavin Cure

The cure that saves horsemen and farmers millions of dollars every year.

It is known the world over as the one certain, reliable remedy for Spavin, Curb, Splint, Ringbone, Bony Growths and any Lameness.

Cases just developing and old, stubborn sores and swellings readily yield to the wonderful curative powers of this famous remedy.

Orangeville, Ont., Dec. 21, '08

"We had a horse which was getting very lame on account of a Spavin. I was anxious about him as we could not work the beast when we most needed him.

Our teamster saw Kendall's Spavin Cure in the store and tried it.

I am pleased to say he had success as the horse has stopped limping and is doing his day's work."

W. A. NICHOLSON.

Don't worry about Spavins, Growths, Swellings or Lameness, but use Kendall's Spavin Cure. It cures every time. The world's best liniment for man and beast.

THE HORSE.

Bran Mash for Horses.

Ever feeder of horses that understands the digestive system of the horse makes use of the bran mash at least once a week to regulate the action of the bowels, to relieve the system from heavy feeding, and at the same time to cool it out. The regular feeding of the bran mash on Saturday evening saves many horses from constipation and also from lymphangitis or Monday morning disease. While the bran mash alone may not prevent the latter trouble, it helps very much in doing so, and if, besides, the feed over Sunday would be reduced to one-half the usual amount, there would be few cases of disease occurring. The bran mash, having a cooling and laxative effect upon the system and the bowels, relieves the lymphatic system, which under heavy feeding of dry, carbonaceous feeds, becomes sluggish and overcharged. It is due to the latter condition that lymphangitis takes place and manifests itself in swelling of either one of the hind legs accompanied by lameness.

HOW TO MAKE THEM.

Bran mashes are made up in many ways, but as a rule it is only in large feeding stables, studs and racing stables that they are made up properly. A little cold or luke warm water poured over the bran in a pail or in a large feed can and mixed, with a little salt added is the usual bran mash Frequently hot water is used, and sometime it occurs that the mash is given to the horse so little cooled off as to scald its mouth, or the horse refuses to eat it and it is left to sour in the manger. The cold or luke warm mash is better than none, but the latter kind is worse than none.

Two properly prepare a bran mash covers more than a mere few minutes of time, and the mixing of the water and the bran. At noon put the boiling water into a clean bucket and into this stir the bran. Then put a cover over the bucket to keep in the steam so that the cooling off takes place slowly and prevents souring at the same time. Then feed in the evening when the bran has been well acted upon by the steam and has cooled off enough to be readily taken by the horse. Whenever salt is to be added to the mash, add it at the time when the mixing is first done.

LINSEED MEAL AND BRAN.

It may be desired to have the mash consist of a mixture of linseed meal and bran, and often this is prescribed by the veterinarian in special cases. To prepare such a mash, one part of linseed meal should be usee in two parts of bran. This should be cooked for several hours by allowing it to simmer slowly on a stove with a low fire. Plenty of water should be added and the cover kept on the containing vessel until the cooking is almost completed. Then the cover should be removed and the water allowed to evaporate so as to make a thick mash, when the latter should be taken off the stove and allow it to cool ready for immediate use.

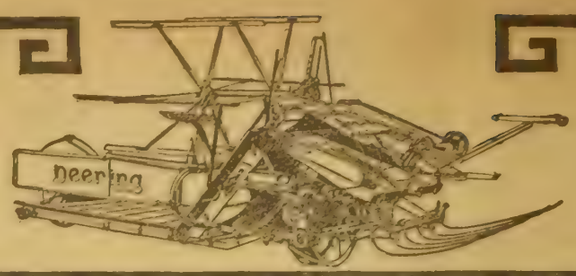
The amount of bran mash fed to each horse will depend upon its size. A horse 1,600 pounds in weight will easily take eight quarts. Driving horses should be fed bran mashes on evenings previous to days of hard driving unless driven a good deal every day. Horses that are worked hard every day and are not allowed any pasture at all do better if given bran mashes twice a week—Wednesday and Saturday evenings.

Unsoundness in Horses.

Mr. Jackson recently made a bold proposal to the council of the Shire Horse Society. It was nothing less than a suggestion that after a certain date an animal should not be eligible for entry in the Stud-Book "unless its sire is certified free from hereditary disease by a veterinary surgeon appointed by the society during the year immediately preceding the birth of such animal." The suggestion has been set aside by the council as impracticable, and this may be a fair comment. But it lies with the council to show how it is impracticable, and in any case the general question should be discussed in all seriousness. One object of the Shire Horse Society is "to promote the distribution of sound and healthy sires throughout the country;" and it is alleged by a writer, in the Manchester Courier, that "a great many members of the society have found out that willingness to pay a high fee for horses with a name has not ensured their having the use of sound horses."

This is a serious ground of complaint for breeders, and possibly it is not confined to breeders of Shire horses; but the great question is, How best to secure the distribution of sound sires? The Shire Horse Society is blamed for supineness in this matter. It is flatly declared that "twenty years ago, when the boom was on, the Yankee were pretty well bitten," and now they are shy of Shires, which have still the reputation of being "soft" horses that will not "wear." This reputation is based on sound premises, and it is the business of Shire horse breeders to remove its foundation.

But, in respect of the main question, the promotion of soundness in breeding



GET ALL THE CROP THIS YEAR

THINK back to the last harvest time. Did you get all the profit from your acres that should have been yours? Or through delays, caused by tinkering with broken-down or inefficient machines, did you lose valuable time? Did you get all the grain—tangled or down—or did your machine leave a part of your profit in every field? Ask yourself today. Did I get the best results possible from my harvesting machines last year, and, if so, are they in condition to give me the same service this year? If not—

Now is the time to choose the machines that will get all the crop this year in the shortest time—with the least effort on your part. That means the Deering. They are machines that will give you the very best service. They are built to meet the conditions encountered on Canadian farms.

The Deering binder is a model of convenience for operating. It is a strong machine. You will not be troubled with breakages. It has light draft and has such a wide range of adjustment that it is adapted for all conditions of grain and fields.

You will be sure of satisfaction with a Deering. It is a proved machine. In addition to binders, the Deering line comprises various other machines in harvesting and haying machine lines, seeding and tillage implements. The Deering local dealer handles I H C gasoline engines, cream separators, manure spreaders, wagons, hay presses and motor vehicles.

Investigate the Deering line. Learn what Deering machines will do for you. Call on local dealer for catalogue and particulars or write to nearest branch house.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

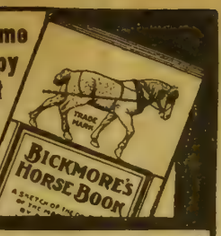
I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - - - - - WINDSOR, Ont.



Send your name to-day for copy of this great HORSE BOOK FREE

You want to know all about your horse. The book will post you. Tells of breeds, breeding, development, marketing, handling, treatment of diseases and ailments. A practical book that every farmer and horse owner should have. We want to send you a copy. Simply write and ask for it. We pay the postage. You will find it worth many dollars to you in telling you how the old reliable stable remedy, Bickmore's Gall Cure, enables you to cure galls, cuts, sores, scratches and all ordinary horse wounds and ailments while you continue to work the horse. Never necessary to lay the horse off.

BICKMORE'S GALL CURE

is guaranteed to cure while horse is under harness or saddle. The great army of dealers who sell it are authorized to return your money if it fails. Buy it and have it on your stable shelf ready for emergencies. It is the standard remedy of leading horsemen, trainers, large stable owners and veterinarians. Sample Bickmore's Gall Cure sent for 6c postage. Address

horses, the same charge of supin eness lies at the door of the Highland and Agricultural Society. The recommendation from the East Lothian Farmers' Club was at last meeting passed by without comment. The subject is not worthy of the consideration of the Board of the national society of Scotland. It exists, one would think, for some other reason than the promotion of what is to be beneficial to agriculture. Holding a great annual exhibition of stock and implements is excellent, but it is not enough.

Nothing is of greater importance than the distribution of sound sires throughout the country, and, as we have frequently pointed out, the Highland and Agricultural Society can give a more effective lead in this matter than any other body in Scotland. It can, with a minimum of trouble, ensure that, so far as human skill can determine the fact, only sound sires will be hired with premiums subsidized from its funds. That this suggestion, with others that are kindred, should be deemed unworthy of consideration by the national agricultural society of Scotland suggests that that Board is dominated by the influence of those who are acting in the interests of owners of entire horses, and not in the interests of the far larger number, who are users of these horses. There is need for a strong man to give a strong lead in this matter, as was done by the late Mr. Speir in what affects dairy farming.—Scottish Farmer.

Adjusting Hames.

A subscriber writes:—"Could you give a diagram showing the best height to have the hames adjusted so that the right pull will be obtained on a horse's shoulders. The extra leather usually seen on collars, presumably to take the wear off the face, seems rather low."

A diagram would aid little in answering this question. The point is well taken, however, and many horses are spoiled by being forced to pull with traces fastened to hames at a point too high or too low. The bony structure of the horse's forequarters is different from that of most animals. The shoulder blades are not attached by any joint to the rest of the skeleton, but simply by a pad of cartilege. In the ox the shoulder blade articulates with the skeleton by means of a joint. At or a little above the point of the shoulder is where the strongest support is found and if a horse has a proper slope of shoulder the point of pull should come near one-third of the distance from the lower part of the shoulder to the top. One reason for having horses' collars heavy as they are is to equalize the pull so that it will not all come on one point. The stiff hames also help to do this. The slope of the pasterns will be found to compare with that of the shoulders. It is frequently noticed that a horse with straight pasterns is also straight in the shoulders and in such a case no amount of adjustment will make up for the lack of proper slope. When a horse is hitched and pulling, the pull, as shown by the direction of the traces, should be as near at right angles to the shoulders as possible. Most hames admit of a certain amount of adjustment and whether the trace attachment to hame comes over the extra leather piece on the collar is not so important as it is to have the pull come right. Improper adjustment here often causes sore shoulders.

Navel-Ill in Foals.

Now that the season is here when the foals are being born, breeders ought to be on their guard against the action of that most fatal malady, navel-ill. It is a germ disease and usually attacks the foal during the first few weeks of its life. The starting point is infection of the navel wound by dirt from floor of stable or other surroundings.

The symptoms of the disease are fever, loss of desire to suck, a swelling in the joints, seen in the knee, hock, elbow or shoulder. The swelling is hot and painful and will sometimes pass away for a time, but only to appear again. Abscesses will form and discharge pus. The patient will be very lame and will be down most of the time and it will get very thin and weak.

Curative treatment is not usually attended with much success. Most of the patients will die and those that escape death often do not amount to much, being unthrifty and they often develop disease of the bone later in life. But while curative treatment is unsatisfactory, preventive treatment is very successful and easy. As soon as the foal is seen after birth, the navel wound should be smeared over with a 10 per cent. solution of carbolic acid, this treatment being repeated at least once a day till the parts heal over, after which there will be no danger of infection from that quarter. About a week or ten days' treatment will usually be sufficient.

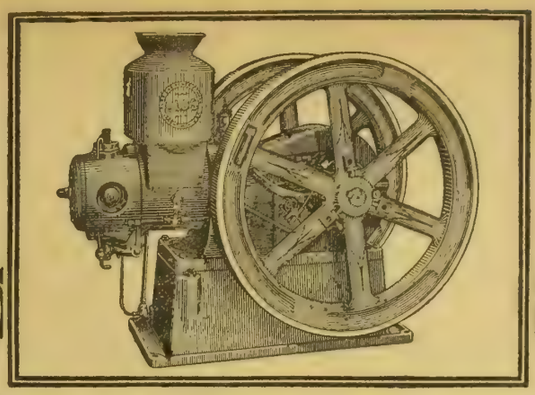
This simple preventive treatment has saved thousands of foals and no farmer should neglect to provide himself with carbolic acid beforehand and be ready at the birth of the foal to adopt the treatment.—VETERINARIAN.

Sore Shoulders and Backs.

On all horses put to work in the spring without previous exercise and more or less hard work the shoulders and neck will be tender and, as usual, the horse in every respect will be in preparation for his task of putting in the spring crop. His body is covered with a heavy winter coat, which causes him to perspire easily. The first farm work in the spring is the hardest of the year and at this time a horse is in the poorest condition to do the work without injury to himself. The shoulders, the neck, and the back become bruised and sore.

Too much care cannot be exercised in seeing that the collar is a perfect fit. A collar that is too large is more likely to injure the horse than one that is too small. The collar should be scraped every morning and carefully cleaned before it is again put on the horse. Before the spring work begins. it is well to oil the harness and have it soft and pliable. For the first fiew days of hard work on soft ground, the shoulders of the horse should be bathed in cold water every night after the harness is removed. The horse will be very sore and tired for a few days and should be given every kind of attention. Watch the hames to see that the draft is at right angles with the shoulders. If it is too low, the collar will be continually "kicking up" at the top and if there are any calloused lumps on the horse's shoulder or back, they should have been removed during the winter when his services are not much needed. If the collar is put on over one of those "sit fasts," it will have the same result as a man trying to walk with a button in his shoe or a bunion on his foot.

This story is not for the purpose of suggesting treatment for bruised shoulders and sore neck, but just simply to remind you that prevention (by having the horse and the harness in good condition before beginning the spring work) is often worth pounds of cure later on when the horse is disabled and you are deprived of his services, for weeks, right in the busy season—GEO. H. GLOVER, D. V. S., Colorado Agricultural college.



Olds Engines

Send for our new catalogue.

YOU can learn engine facts you really should know before deciding on your gasoline engine.

The catalogue proves why it is good judgment to own an Olds engine and be sure you have the most practical, most economical, most durable rather than to get a cheap engine and take chances on losing all it costs you.

Besides the highest quality of workmanship and material the Olds Engine has many special and exclusive features. Each one means a great deal to you.

1. Removable water jacket—may save you $100.00.
2. Seager Patent Mixer has not a moving part to wear or get out of order.
3. No gasoline pump of any kind to leak or be primed.
4. Cylinders and Pistons of special metal—ground to exact size.
5. Cylinder and head one piece—water cannot enter cylinder.
6. Safety Governor—positively prevents engine's running away.
7. Absolute guarantee—NO REPAIR BILLS for the FIRST YEAR.

Tell me what you need an engine for and I will assist in selecting the proper size. Write the nearest office.

Feminine Horse Wisdom.

If I were a man I would be ashamed to crowd a horse in a narrow stall, with no chance to straighten out his limbs and lie in comfort, and I would not allow a barn to go for days without being cleaned out.

I wouldn't be so afraid of using the curry comb and brush as some men are.

I would look after the noble horse's bed and see that he had plenty of good dry straw.

No horse of mine, if I were a horse owner, should be allowed to stand out in a storm or in a cold wind or draught in a stable.

I would have harness and collars to fit each horse and the horse's feed I would change often, for his appetite, like that of the human family, demands a change.—FANNIE M. WOOD.

A Practical Test for Stallions.

Before closing for the services of a stallion, suppose, says Farm, Stock and Home, you ask the owner how much his horse can pull, and then notice his look of blank amazement But why not ask it? The dairy sire is selected in large part on the strength of the producing record of the females of his family, the beef sire for typical beef conformation, the trotter because of his actual track performances. Why should the drafter be the sole exception to this practical consideration? Why not expect from him actual performance in the traces—stamina, strength, reliability? Why depend solely upon size, which may be misleading and upon fat, which has little or no merit in the trace chains?

Enlarged Hocks.

Enlarged hocks in young horses frequently are due to sharp strain upon that part of the leg. Two stallion colts running together indulge in rough play as yearlings, especially if they are well fed, and one of the results is swollen hocks. Separate the high spirited youngsters and nature will effect a cure. Speaking of spavin, Robert Bonner said: "It is brought about by the gross neglect of the people, whose duty it is to look after horses. It is absolutely impossible for a horse to throw out a spavin unless he is too long in the toe." Mr. Banner never failed to urge the necessity of keeping the feet level. His eye was remarkably keen and his study of form and motion enabled him to detect faults not apparent to less gifted men. He could tell at a glance when a horse was out of balance and he was never at a loss as to the remedy. There are thousands of yearlings on the farms of the country, whose feet need attention right now. Danger lurks in the long toe. Spavin developed by accident is not transmissible. The wise thing to do is to avoid the cause of spavin.

MILBURN'S LAXA-LIVER PILLS

Stimulate the Sluggish Liver.

Clean the coated tongue, sweeten the breath, clear away all waste and poisonous material from the system in Nature's easy manner, and prevent as well as cure Constipation, Sick Headache, Biliousness, Heartburn, Catarrh of the Stomach, Sour Stomach, Water Brash, and all troubles arising from a disordered state of the Stomach, Liver or Bowels.

Suffered for Years.

Mrs. J. C. Westberg, Swan River, Man., writes: —"I suffered for years, more than tongue can tell, from liver trouble. I tried several kinds of medicine, but could get no relief until I got Milburn's Laxa-Liver Pills. I cannot praise them too highly for what they have done for me."

Price 25 cents a vial, or 5 for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

PILES CURED at HOME by New Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

POULTRY.

Raising Turkeys.

Young and growing turkeys are more easily influenced by their surroundings than any other class of poultry, and thus the weather during the early stages of development is an extremely important matter. While we cannot change the weather, we can do a great deal to counteract its evil effects, and by providing plenty of shelter and shade from rain and sun we can make ourselves, to a limited extent, independent of its vagaries. Complaints were rather common a few weeks ago concerning the scarcity of eggs but a great improvement occurred in this respect during May, and on most farms the stock of young birds has been well maintained. In a few districts rather a large proportion of the early eggs was infertile, and where this has happened turkey chickens are rather scarce, and in some instances backward.

SUITABLE CONDITIONS ESSENTIAL.

As already mentioned, it is of the utmost importance to select a place for the raising of turkeys that is favorably situated, since they are so very easily influenced by their surroundings. So important a factor towards success is this that I should strogly recommend those who live amid unsuitable surroundings to leave this branch of poultry-keeping alone, for if they persist in their efforts failure is almost certain to ensue. Even if the chickens are reared to killing size they are rarely satisfactory. They may be stunted in growth, or it may be that they have involved so much trouble and expense to rear that they have more than absorbed their profit. A heavy clay is unsuited to turkeys; so is a low-lying place, as in this case the atmosphere, as well as the soil, is likely to be heavily laden with moisture, and damp is fatal to turkeys, particularly quite young birds. A very cold situation, exposed to all the winds that blow, is also unfitted to this class of work, though of the two it is more favorable to successful rearing than is a clay soil or a damp position. I have many times seen a flock of young turkeys, apparently enjoying excellent health, upon very high, exposed land, but possibly an extra hardy strain had been obtained, or else the poultryman was particularly clever at his work. There are so many lucrative branches of the poultry industry that can be carried out successfully amid somewhat unfavorable surroundings that it seems a mistake to attempt raising turkeys which are, at the best of times, by no means hardy birds.

FACTORS TOWARDS HARDINESS.

A great deal of the common delicacy of turkeys—and it cannot be denied that very frequently they are extremely delicate, — is due of the Black Norfolk variety—is due to two errors in the mating of the mating of the parent stock. The one is that young parents are depended upon to much too great an extent. Turkeys are really very slowly developing birds, and full maturity is not reached until they are nearly or quite three years old. It is therefore, a mistake to use both parents much below this age. If a young male bird is used the hens should be in their third season, and vice versa. The other reason for the common delicacy of turkeys is that so much inbreeding has been practised in the past, a great mistake when utility points are the main object, or when the poultry keeper does not know exactly what he is doing. Breeding from related stock is essential sometimes, but it is quite unnecessary in the case of turkeys. It should only be practised when there is no other alternative; such, for instance, as in the case of forming a new breed, or a new variety of an existing breed, or in establishing a new color, but for ordinary purposes it is not only unnecessary but it is more often than not absolutely harmful. If matured parents are used, and no in-breeding is allowed to take place, it is only slightly more difficult to rear turkeys than other classes of poultry.

THE GROWING BIRDS.

Up to the age of about eight weeks, when the process known as "shooting the red" takes place, turkey chickens require a great deal of attention. For one thing their crops are smaller than those of ordinary chickens, and feeding must take place more frequently. It is very important, too, that the youngsters are never allowed out on to wet grass, especially if it be at all long, as wet feet has nearly always a harmful effect upon their development. A run should therefore, be placed around the coop so as to prevent their wandering away. Once the birds have "shot the red," however, they have passed the most critical period of their lives, and their treatment does not differ very materially from that of other kinds of domestic fowls. While they are passing through this somewhat trying stage they require particularly careful looking after, as for the few days that the red is making its appearance any inattention on the part of the poultryman may have the most serious consequences. Nutritious foods should be provided, and, most important of anything, the birds must not be permitted to get wet. If the weather is bad they should be kept under cover during the entire period. More really depends upon the quality of the food supplied than upon the quantity. Biscuit meal should be liberally provided, well soaked in hot water, and given to the birds in a warm state. A liberal supply of green food and pure drinking water are likewise necessary.

FREEDOM ESSENTIAL.

It is next to useless attempting to keep growing turkeys, in confinement, since they rarely thrive well under such conditions. Not only is development considerably retarded when the birds are confined in small runs, but they are less healthy altogether, and they cost more to feed, as they are able to obtain practically no natural food for themselves. There is nothing upon which young turkeys thrive so well as upon natural foods, worms, grubs, insects, etc., and only are they able to obtain these when they have a free range. Keeping growing turkeys in confinement has often been tried, but never, so far as I am aware, with anything approaching success. Until the hay is removed space is often somewhat limited, and it is necessary to keep the turkeys within perhaps a comparatively small area, but as soon as hay making is over the birds should be allowed to wander about as much as possible. The soil is particularly abundant in animal and vegetable life for the few weeks after the grass is cut, as no stock has been upon the land for so long. After the grain is cut, too, turkeys should be given access to the stubbles, and when this is done the birds can pretty well support themselves upon the natural foods they are able to obtain. Every penny that can be saved through reducing the food bill is a penny earned, and only by exercising the utmost care in this direction is it possible to make turkey raising pay well. At the same time, cheapness in feeding is by no means the only consideration, as it is false economy to stint the birds of anything that is necessary. Such good prices are obtainable at the Christmas season that one can afford to feed the tur-

Brantford Roofing has two trade-marks

You cannot always judge a roofing by its price. Lower-grade roofings are often sold at about the same price as Brantford Roofing. So please be careful.

You can only make sure of lasting service by first making sure that you are getting the GENUINE Brantford Roofing. Remember that each roll of the genuine bears two trade-marks. One trade-mark is "a roof with a big letter B in the gable." The other is a "rooster" in the act of crowing. 22

Send right now for our big roofing book. It tells our reasons for making Brantford Roofing higher in quality than any other ready roofing. We believe you'll appreciate these reasons. It also tells why we make Brantford Roofing in THREE finishes—Asphalt, Rubber and Crystal.

BRANTFORD ROOFING COMPANY, LIMITED, Brantford, Canada.

keys well. It is extremely important to give the growing birds plenty of shelter during hot weather, as too much sun has a very bad effect upon their health and development. An abundant supply of pure, fresh drinking water should be available at all times, and this, too, should be kept away from the direct rays of the sun. Green food and grit are necessary, the former to maintain the blood cool and the organs healthy, the latter to assist in the proper assimilation of the food.—E. T. B. in Farm and Home.

Eggs for Hatching.

It is a well-known fact that eggs for hatching sent by post or rail frequently give poor results. The fault lies sometimes with the eggs, but still more frequently with the system of packing adopted. The aim should be to avoid not only broken shells, but also to prevent injury to the delicate membrane enclosing the yolk, as an egg may be completely spoiled for hatching without a trace of fracture appearing on the snell. This can be prevented by using a package of moderate size and weight.

Of the many patent egg boxes some of the best are too expensive, others are too small, and a still greater number too fragile. The popular cardboard boxes are objectionable. They undoubtedly save labor in packing, and are light in weight, but their inital cost, the number of breakages that occur whenever they are used, and the make of these boxes an expensive item for the small poultry keeper.

After trial of many different kinds of package, nothing had been found to compare with a plain wooden box 11x7½x3½ inches (outside measurements) made of the very lightest boards.

To pack a dozen eggs, a layer of hay is placed at the bottom of the box. Each egg is first placed in a piece of newspaper and then in a strip of soft hay, after which it is placed on end in the box. A box of the dimensions given holds twelve eggs in four rows of three eggs each. It is most important that the eggs should stand on end, and that they should be so tightly packed that they cannot move when the box is roughly handled or shaken. The proper amount of hay to use is easily determined with a little practice. The lid should be tied on, never nailed, and no label is necessary, as the address can be written with indelible pencil on the white wood. The danger of having valuable, high-priced eggs broken or interfered with when sent in a box that is tied only, and not nailed, can be overcome by screwing down the lid.

In order to get best results, all eggs for hatching that have been been sent a journey should be unpacked and allowed to rest on their sides for twenty hours before they are placed under the hen.

Chicken Fattening.

On the Continent of Europe fattening has become quite a fine art, and in England now much more is being done than used to be the case. Fattening is a maturing by means of which the bird's flesh becomes more tender. There are two ways of fattening—one, by the forcing process in a fattening shed, only possible where chicken-rearing is carried on in a very large way; and the other, the ordinary way of giving certain selected foods without confinement. There are plenty of scientific fattening foods on the market, or, perhaps the best of all is, a mixture of oatmeal and milk, with a small quantity of maize, for it darkens the flesh, and makes it oily, and the oatmeal should be in the coarsely-ground state. Naturally, chickens will fatten more rapidly in a pen, where they are shut up and get no exercise, and therefore put on flesh more rapidly; but where only a few birds are being fattened, the poultry-keeper will do practically as well if he gives them a small amount of liberty in a limited run. But a very important point is to kill them off at the right time. If kept beyond this, when they are just in their prime, the birds will go back and can never be brought on again to their first state of perfection. And what, then, is the right limit beyond which the birds should not be kept? Three weeks or a month at the very outside. It is well also to bear in mind that a strong light should be avoided, for it does not tend to whiten the flesh as absence of light does. This, of course, is easily arranged in the fattening shed; but the run can be well shaded from the sun and kept more or less dark. These various points, once well understood, make chicken fattening a much easier and simpler and also more profitable industry than many suppose it to be. —F. W., Farm and Home.

Raising Layers.

Do not blame your pullets next winter when they are not laying; you should have been busy on the problem during the lost winter. You should know which hens are furnishing the eggs from which these pullets will be hatched; the chances on the average farm are that the eggs from the poorer layers and slower maturing pullets are being used for this purpose, and that the hens that have been laying all winter are being used to hatch these eggs. Culling, selection, elimination, kept constantly in mind, and continually practiced, will mean healthier fowls, livable chicks, earlier pullets, and eggs when they are most wanted. Cull out the extra males and the weaklings; select the quick maturing, early laying pullets and the hens that laid well during their first laying year, and make up a breeding pen for producing eggs for hatching. With them have a male or males whose dam was a vigorous, prolific hen Do not set eggs from the whole flock, but dispose of all males not used in this breeding pen, and from the remainder of the flock gradually eliminate the drones. It is surprising how large a proportion of the average flock is useless; or worse than useless; for these non-producers are in the way of the workers and are preventing them from doing their best. If you cannot make up such a breeding pen this spring, try this for next season. Next fall mark or band the first thrifty pullets to begin laying; also the yearling hens that are doing well this season. During the early winter carefully note their performance, and from these banded hens and pullets make up your next year's breeding pen. You will be surprised at the increased vigor and productiveness of your flock. If your hens are not responding to good treatment with a good average egg yield, try increasing that average by cutting out the nonproducers. A well-bred, well-housed, well-fed, and well-cared hen will lay 60 eggs during the three spring months, enough to pay her board for the entire year. There is money in hens; get it out. —W. E. Valpon, Colorado Agricultural College, Fort Collins.

PREPARE NOW TO MAKE EVERY MINUTE COUNT AT HARVEST TIME

FOR you must make every minute count then to be sure of getting the full profit from your acres. Smooth, rapid, uninterrupted work is a necessity when the grain is ripe for cutting. Every delay due to a slow, inefficient broken-down machine will rob you of a part of the reward you have a perfect right to expect.

You have used great care in preparing the ground—sowing the seed—caring for it while it is growing.

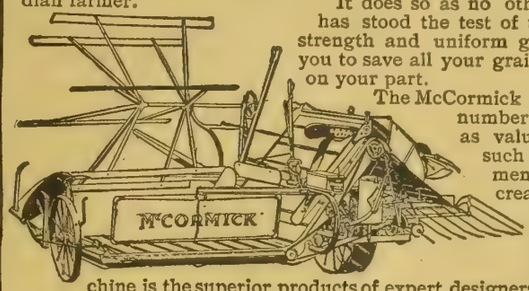
Don't, through lack of foresight now, run any risk of making valueless at harvest time the hours of labor spent in preparing for it.

Be prepared to get all the crop with a McCormick.

Your grain may be tangled or down.

It does not matter, a McCormick Binder will pick it up quickly and bind it in the best possible shape.

The McCormick Binder is made to meet the requirements of the Canadian farmer. It does so as no other machine does. It has stood the test of time. Its light draft, strength and uniform good work will permit you to save all your grain with the least labor on your part.



The McCormick line embraces a large number of other machines just as valuable as the binder, such as drills, tillage implements, gasoline engines, cream separators, wagons, hay presses, manure spreaders and motor vehicles.

Every McCormick machine is the superior products of expert designers and skilled workmen.

Look over your machines today. See what you need to properly handle the harvest this year. Then call on a local dealer or write direct for further information. Take the step now that will insure your getting all the profit from your harvest.

INTERNATIONAL HARVESTER COMPANY OF AMERICA CHICAGO U S A
(Incorporated)

The Original "HALLOCK" Weeder.

The object of a weeder is to keep down the weeds, therefore, it resolves itself into this one fact: that a weeder should be used early and often, so as not to give the weeds a chance to grow. You will not injure your crops by working the ground directly over the plant or grain, but will do much toward increasing the growth and yield.

You can work them in dry or wet weather, they will not cut the roots of the crop, but cultivate just deep enough to retain the moisture just where it is needed. But, do not forget the old rule—Use the WEEDER early and often, and when you are all through with all kinds of other cultivators, our weeder will finish your job in No. 1 shape. Thousands in use. Write for prices and terms.

Send in your order now for the "HALLOCK" Weeder. Goods are now in hand, all orders will receive prompt attention.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Unruly Member.

By Marion Harland.

(Continued from lastissue.)

On the threshold of the house, another warning awaited her. The door was opened by a kind neighbor, Constance's nurse for the day. "Walk in!" she said, in a louder tone than seemed advisable, considering the proximity of the sick-room. "Constance will be glad to see you." In a whisper, she contInded: "She saw you from the window, talking witn Dr. Merrill, and will ask you what he thinks of her. She is nervous and down-hearted to-day, so, if he did say anything unfavorable, don't hint it! Agitation would be fatal, in her present weak state."

The dying girl was propped up in an easy chair by the window, and beside her sat Ellen Miller. The placid face of the latter in a measure quieted Cora's excitement, or her nerves and courage would have been severely shaken by the wistful gaze riveted upon her, as she stooped to kiss Constance's hot forehead. "How are you to-day, dear?" she inquired.

"I cannot tell, Cora; I doubt whether I am as well as they would persuade me into believing. I fear, sometimes, that it will be a tedious season before I recover, if I ever do. This increasing weakness does not promise the return to health about which the Doctor and others talk to me. Do you suppose that they could deceive me, and I sick almost unto death, Cora?"

"What an absurd fancy!" said Cora, playfully. "Your sickness has produced a radical change, indeed, if it has taught you suspicion, and of those whom you love. Fie! I, for one, am disposed to resent the implication."

Constance laid her thin hand within that of her schoolmate. "Do not be disuleased," she said, with the plaintive simplicity of a child; "but this dread haunts me. Nothing but love and kindness moves them to tell me what they do; still, I cannot wondering if this fear of causing me pain is not tempting them to blind me, as long as they can, to the fact, the solemn truth that I may die of this illness."

"Dear Constance," said Ellen, "why brood upon this thought? Be sure that your earthly friends would not knowingly mislead you, and, should they err in their opinion of your situation, what is there so terrible in death? Remember in whose hands are the issues of life. If it pleases your heavenly Father to call you home, are you afraid or unwilling to go?"

Tears gathered in the eyes large and bright with the insidious disease. "Not afraid, Ellen. I learned, long ago, to trust and love Him, and I know He is able to keep all that is committed unto Him. I do try to say, unmurmuringly, 'Thy will be done!' but it is hard to resign the life He had made so full of sweetness, which He has given me capacity to enjoy; and I am so young—so young!"

She clasped her fingers passionately upon her brow, as if to still its throbbings.

"This will never do!" said the nurse's eye and finger to Cora, unseen by the sick girl.

Cora knelt down by Constance's chair, and drew her head to her shoulder. "My dearest friend, you cause yourself needless anxiety, and us exquisite pain. You will live to see how uncalled for all this borrowed trouble. We cannot let you go yet. You are alone in your imagination that you will be compelled to leave us soon. The spring will restore hope and health together."

"Did the Doctor authorize you to say so to me?" inquired Constance. "You speak pery positively. Have you his warrant for your prediction? You were talking of me, were you not? I watched you both, as I sat here, and told Ellen that I should entreat you to repeat every syllable he said."

It would have been a hard trial to one of less acute sensibilities and sterner principles than our poor Cora to see that face, so lovely in the eagerness of reviving hopes, and reflect upon the sentence that had gone forth against the "sweet" life to which she clung. It was no occasion for even slight marvel that she succumbed to the temptation.

"What an egotistical little creature you are!" she said with a laugh that sounded like genuine heart-music. "Dr. Merrill commented upon the weather and my blooming cheeks—for he is often gallant, after his fashion, cross as he is generally, —and merely observed, at parting, that you were low-spirited this afternoon, inclined to be hypochondriacal, and that I must cheer you up."

"But you must have asked him how I was," persisted Constance, not satisfied.

"I did, and I forget the precise 'syllables' of his reply. The substance of it was that you were 'no worse,' or 'well enough, if she would only think so,' or something else as amiably complimentary, so well as I remember."

"He did not intimate that I was dying, then?"

A cold hand, like that of death itself, struck upon Cora's soul, but superhuman power—from what source?—was granted her to answer steadily, cheerfully, desperately: "So far from that, he said that you were getting along slowly, but well, and alluded to your recovery as a matter of course."

When the sisters-in-law expectant left the invalid, she was comfortable in body, and manifested more liveliness of spirit than she had shown since an early stage of her sickness. Cora's conscience, seduced from its fidelity by her repeated perversions of good and evil, was basely recreant enough to congratulate her upon a worthy deed performed in the face of difficulties that would have daunted a lesscourageous spirit.

Early on the ensuing morning, a messenger came from Mrs. Remer to beg for Mrs. Manning's presence and sympathy in her sore bereavement. Constance had died at daybreak! When Cora could endure to listen, she heard how peaceful was her departure; how quietly and unconsciously the gentle spirit left the beautiful clay tenantless; learned of her affectionate and grateful mention of the beloved friend who had put to flight her presentiment that the dark browed king of terrors was, even then standing at her sid?. "Cora's visit has been an actual blessing to me, mamma. My dreams will be happy ones to-night, I know," she said, before committing herself to sleep. Her awakening was among the angels.

If these tender recollections of the lost one assuaged the bitterness of Cora's grief, her outward bearing was a false index to her inner emotions. For days and weeks she labored under an extremity of depression, as foreign to her nature as it was obstinate in its resistance to the efforts employed to relieve it.

"Constance's death was a fearful shock," said the Mannings and the majority of their acquaintances; but there were not wanting those who put another intepretation upon the gloom that shadowed a face but lately all beaming with health and pleasure.

"Cora is sadly altered," said the indefatigable Miss Healy, at an evening party. "She was invited here to-night, but sent a regret, so Miss Williams tells me. Some will have it that she is mourning over poor, dear Constance Remer's death, who was no more to her than to many of the rest of us. I guess there are other reasons why she should not feel particularly gay just now, and especially why she should not care to be here this evening."

Her ?mphasis and knowing shrug brought the wished-for request for enlightement on the part of her auditory.

"I do not know whether it is exactly fair to repeat the story in Mr. Miller's presence," simpered the mischief-maker, rolling her eyes affectedly at Horace, who stood near.

"That scruple can be easily overcome; I will retire out of hearing," he said, as indifferently as he could.

"No, please don't!" and the lady involuntarily (?) grasped his arm. "You wodld go off thinking me an ill-natured, ill-mannered tale-bearer. I have nothing disreputable to relate."

"I hope not, indeed!" Horace could not help saying.

She paid no notice to the interruption. "Nothing that you may not have heard fifty times over. I should not wonder if you were better posted up on this subject than any other person alive. It is altogether proper and likely that you should have had a version of the romance from head-quarters. Did Cora never confide to you the story of her youthful folly—herengagement to Fred Williams, nephew to our host?"

"I am now first made acquainted with the existence of that highly distinguished personage," said Horace, coolly contemptuous.

"Hush-sh-sh! There he is! He lives now in B——, but is spending a few days with his uncle. This is why I understood so quickly the source of Cora's low spirits, which disqualified her from joining our number. 'Auld lang syne' cannot be so soon forgotten. Do not be uneasy, Mr. Miller; yours is not an isolated case. You recollect the song: 'On revient tou-jours a ses premiers amours.' I dare say it is nothing more than the thought of her sufferings in the past, on his account, that indisposes Cora to meet her old flame. .It went very hard with her, when her father, at Mrs. Barrett's instigation, broke off the match. For years, there was a coolness, nearly amounting to a decided rupture between 'Aunt Janet' and her protegee."

"Was there a regular engagement?" asked some one.

"Fast and firm, my dear sir! She denied it, but not as positively as she does now, that there ever have been any pledges, mutual vows, etc., between herself and another individual whom I could name, but, dear me! everybody fibs about these things. You ought to have seen 'Aunt Janet's' look of solemn reproof when her niece's pretty mouth took oath by all the saints in the calendar, and by some who are not, for she protested upon her own word of honor, as a lady, that Mr. Nameless-just-now was no more engaged to her than she was to the man in the moon. I wanted to burst out laughing in both their faces."

Too much disgusted and annoyed to listen longer, Horace turned his back upon the scandel-monger, and began a conversation with his nearest neighbor; but Miss Healy had sufficient wit to see that her shaft, rough and coarse as it was, had found a joint in the harness. Her sly smile was truly feline, when she remarked his closer inspection of the junior Williams, and the curl of the lip which concluded it. She had her reasons for disliking young Miller, and would have gone to greater pains to torment him than the retailing of this one item of gossip cost her. It was unlike him to narrate the circumstance to his betrothed, confidently as Miss Healy had calculated upon this action. He was ashamed of it the instant the recital escaped him; angry with his thoughtlessness, when Cora's perturbation evinced that her annoyance or surprise surpassed his. She even trembled and grew pale with the unsuccessful attempt to reuly to .his story.

"You will call me a jealous fool!" said Horace. "Foolish I am to cause you uneasiness about the contemptible business, but it is not jealousy that irritates me, as I recall the tattler.s accusation. I wish she were a man. How I should delight to horsewhip the one who dared to couple your name with that of the coxcomb, the brainless puppy, who did nothing but pull his dust-colored moustache and drawl

OWES HER LIFE TO

Lydia E. Pinkham's Vegetable Compound

Vienna, W. Va.—"I feel that I owe the last ten years of my life to Lydia E. Pinkham's Vegetable Compound. Eleven years ago I was a walking shadow. I had been under the doctor's carebutgotnorelief. My husband persuaded me to try Lydia E. Pinkham's Vegetable Compound and it worked like a charm. It relieved all my pains and misery. I advise all suffering women to take Lydia E. Pinkham's Vegetable Compound."—Mrs. Emma Wheaton, Vienna, W. Va.

Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs, contains no narcotics or harmful drugs, and to-day holds the record for the largest number of actual cures of female diseases of any similar medicine in the country, and thousands of voluntary testimonials are on file in the Pinkham laboratory at Lynn, Mass., from women who have been cured from almost every form of female complaints, inflammation, ulceration, displacements, fibroid tumors, irregularities, periodic pains, backache, indigestion and nervous prostration. Every such suffering woman owes it to herself to give Lydia E. Pinkham's Vegetable Compound a trial.

If you would like special advice about your case write a confidential letter to Mrs. Pinkham, at Lynn, Mass. Her advice is free, and always helpful.

'Ah-h, indeed!' 'Ya-as!' 'Ne-ow, real-ly!' the whole evening! I forget! This is a serious matter—sport to me, it was once almost death to you. It is 'altogether proper' that I should enact father confessor, and possess myself of the 'romance,' from preface to 'Finis.' How old were you when you surrenhered your heart, without firing a shot,at the siege of this invincible Adonis? What a flint your father must have been to condemn you to inconsolable misery by his refusal to sanction so congenial a union! What filial piety you have exhibited in not hating him and Aunt Janet forever and a day!"

Instead of replying to his raillery, she burst into tears. The bewildered Horace wondered, apologized and coaxed by turns.

"Only tell me how I have offended!" he begged "You could not have conceived the idea that I was in earnest in aught that I have said. I never imagined that you would regard Miss Healy's fabrications more than I do—than every one does—as beneath the contempt of decent, sensible people."

Cora wept in silence, only signifying by a gesture that he was not in fault. Completely baffled, Horace had to await the subsiding of the flood. As her face cleared, his darkened. An unwelcome fancy had crossed his brain.

"Dearest," he said, tenderly, yet so gravely that she shook with alarm, "I do not seek to know the fount of the tears which have astonished as mucn as they have distressed me. Answer me a single question, and we will let the unlucky topic rest. Was there one iota of truth in all that Miss Healy reported? Was this man ever an intimate acquaintance—a suitor of yours?"

"Never!" murmured the frightened girl.

"Was there ever an attachment on either side?" pursued Horace.

"None tnat I knew of," was the response.

"I am content!" and he withdrew her hands from the tear-stained cheeks. "My little darling, you are weak and nervous, and are scared by shadows. Pardon me for teasing you so pertinaciously. Seriously, if you had fancied yourself in love fifty times in your girlhood, I should not care, provided you confessed it to me. The history of ten engagements and as many broken hearts on your part, even were all the honored swains Fred Williames, would not arodse the pang I should experience at one uartial or distorted coofidence. I am pleased, though, that you never cared for the fellow, else I might feel less flattered by your unaccountable acceptance of your humble servant."

"You were nev?r more welcome!" cried Ellen Miller, as Cora dropped in for an afternoon call. "I have an agreeable surprise in reserve for you. Come into the back parlor. There is something there you will be overjoyed to see."

Full of effpectant pleasure, Cora followed her. A lady arose at their entrance, but there ensued no such scene as Ellen had pictured to herself. The telltale blood dyed Cora's temples with shame and embarrassment, whilst the stranger remained quietly standing, without any token whatever of recognition.

"Is it possible that yod have forgotten Mary Chester?" said Ellen. "And, you, Mary, do you not recognize an old friend in Cora Manning! What fickle hearts or short memories you two must have!"

"Forgive me, Miss Manning," returned Miss Chester, extending her hand in graceful salutgtion. "I did not remember your name lor a moment, familiar as your features seemed to me. Have we met before, and where?"

"In B——. My aunt, Mrs. Barrett, is a resident of that place," Cora continued to say, she never knew how.

"I have the pleasure of a slight acquaintance with Mrs. Barrett,'j said Miss Chester, charitably intent upon removing the confusion of the other. "If I had known that she had a relative here, I should have done myself the honor of a farewell call, and inquired if she had any message or letters for you. Have you heard from her recently?"

"She has been with us for several weeks," was Cora's reluctant answer, for Ellen's eloquent countenance bespoke amazement of this singular proof of the "extreme intimacy" of Mrs. Barrett and her family whose "grounds adjoined" hers.

"You have visited her occasionally, I suppose?" resumed Miss Chester. "How careless in me not to recall the circumstances of our former introduction! I am not usually so forgetful. I must request your forbearance, promising never again to be guilty of a similar fault towards you."

Her scrutiny, earnest and puzzled, engaged that she would keep her word. The visit passed off stiffly, affable as she endeavored to be. She felt that there was a mistake, not her own, yet that continued inquiry would be unpleasant. Ellen was not less perplexed, and more troubled; while Cora's chagrin defied description. She took advantage of the earliest opportunity of ending the embarrassing scene, and walked hurriedly homewards, execrating her folly and the dnpropitious fate that had enabled the Chesters to keep an engagements so long postponed. There were more sickening misgivings mingled with her discomfiture.

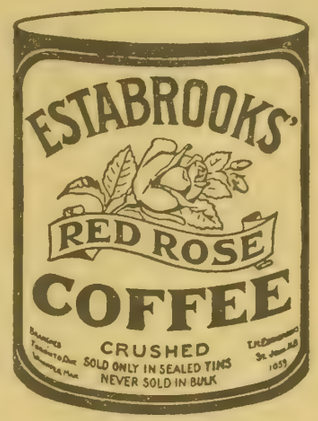
"What will Ellen think? She will tell Horace! What will he do? What can I say?"

The straight road of honest, penitent confesson was the last she meditated taking. The web of her own inconsiderate weaving was about her, choking, blinding, criupling her at every turn, and she planned escape by plunging deeper into its intricate windings. Culpable as was her confirmed habit of misrepresentation, lax as her morals had become through long indulgence in prevarication, she had seldom, if ever, manufactured and uttered a deliberate lie, such as she laid away in her neart, ready for her betrothed's hearing and belief againtt his next coming.

She met him with ...pidation, and one glimpse of his ...ures assured her that something weighed upon his spirits. There was a single flash of light—the fond beam that always greeted her—then the cloud again usurped the place of the "clear shining." It was an unspeakable relief to the guilty heart when the cause of his sadness was announced. The speculation of which we have treated upon a former page, as having excited his friends' fears, and in some degree, his apprehensions, had been unfortunate. He was likely to lose heavily by it—how heavily he could not as yet determine; it might eventuate in a total wreck of fortune. Like the strong-hearted man and Christian he was, he indulged in no useless murmurs at fate, or cowardly misgivings at what the future might have in reserve to tax his fortitude and strength. Already he was devising expedients by which he might retrieve his failure, if failure it should prove to be. Against all reverses he was prepared to struggle bravely, except the delay of the union wherein were centred his best anh proudest hopes. They might be obliged to live more plainly than he had anticipated, he stated to his ladylove, but, if the worst should befall him, he would still be able to

Crushed Coffee— what is it?

By a new process of crushing between steel rollers, instead of grinding, the skin, which remains in the eye of the bean after roasting, is separated from the kernel and removed by air suction, while the kernel is broken into small even grains. These grains when steeped, being free of the skin or chaff, settle quickly, leaving the liquid clear and bright, and give the true coffee flavor.



Estabrooks' Red Rose *crushed* Coffee is as easy to make as Red Rose Tea. Directions are in each tin.

It is strictly pure, not a particle of chicory or any other adulterant being used, and ispacked in air-tight tins the same day it is roasted so to retain its full flavor, fragrance and strength.

A good combination is Estabrooks' Coffee for breakfast and Red Rose Tea for other meals.

Estabrooks' RED ROSE Coffee

ORDER A TIN IN TIME FOR BREAKFAST

Munroe & McIntosh Carriages of every Description.

We will be pleased to quote intending purchasers our best prices and terms, delivered at any railway station in Nova Scotia.

BLIGH & PRINCE

offer her a comfortable home, and together they would wait patiently for the dawn of more prosperous days. All that was noble in Cora's nature was drawn forth by this appeal. She hastened to disabuse Horace's mind of every apprehension of reluctance on her side to fulfil their contract, or repugnance to entering the humble dwelling he had described as her probable abode for years to come. Her regrets were all for him and his disappointmentf In her cheerful constancy, her self-forgetful love, he found compensation both for disappaintment and the suspense which was yet more harrowing.

Mr. Manning interrupted the dialogue. He, too, was full of sympathy, and was not quite superior to the temptation to repeat his prognostications of this very result. "I wanted to caution you, my boy," he said, shaking his head sagely, "but young people are apt to consider us old fogies as a set of bilious croakers, and regard our advice accordingly. Cora here can testify, as can my wife and sister, that I foresaw this evil from the start. And sharply was I taken to task for my opinion, I assure you" nodding at his daughter. "I won't repeat the womanly arguments that hailed about my ears until I was glad to hold my peace."

(Continued next issue.)

Rules For Making and Baking Cake.

Have the oven ready to receive the cake as soon as it is mixed. The oven can wait a few moments for the cake; the cake can never wait for the oven. The coarseness of cake is frequently due to its standing for a moment before going into the oven or the oven not being at the rignt temperature when the cake goes in.

Cakes without butter require a quick oven.

Cakes with butter require a moderate oven.

Cookies or small cakes require a moderately quick oven.

Cakes containing molasses require careful watching in a moderatee oven as they scorch easily.

If your cake browns as soon as you put it into the oven, the oven is too hot; cool it as quickly as possible by lifting the lid of the stove, or stand in the oven a quart pudding-pan filled with cold water.

Never move a cake in the oven until the centre is thoroughly "set." If you jar it, it will become heavy in the centre and near the bottom. This is due to the breaking of the cells.

To try a cake without a thermometer put your ear down near the pan; if the cake ticks loudly put it back, as it is not done. If the ticking is very faint or absent it is done. Take it from the oven, but do not handle it while hot.

It is always well to line cake-pans with greased paper, to prevent burning at the bottom.

Oatmeal Gruel for the Sick.

To make oatmeal gruel for the sick put half a cupful of oatmeal in a small cheesecloth bag and wash it out in a quart af tepid water. Rinse the bag back and forth in the water until all the flour is washed out and only the bran remains. Then add half a teaspoonful of salt to the oatmeal water and cook slowly for two hours, adding water so that there will be about a pint when it is done. If milk or cream is allowed the patient a tablespoonful of cream to a pint of gruel will make it more appetizing and nutritious. This will often stay on a weak stomach where nothing else can be retained, and where warm drinks nauseate it may be given cold.

Go Carry the Message To Gracia.

For a number of years you have seen over the top of this page, a little note from the editor, a part of which reads something like this—"Ladies this department is yours, use it to the best advantage." Now I should like to know how many ladies have tried to make this page interesting or instructive, by sending along a spicy little article, or exchanging a helpful idea. The time has come when we cannot live within ourselves; to broaden and develop we must have literary intercourse just as this season of the year, when all nature is awakening from her long rest, people begin to absorb new life, are imbued with new ambitions.

A few helpful suggestions just now, a new thought that means something and given at the proper time, may be the means of encouraging some man or woman; of reviving dormant energies, of bringing to life possibilities that even surprise themselves. True, some of our haggard faces look the surfaces of dead hopes, but let us thank God for the countenances that are smiling and the hearts that are brim full of hopeful aspirations. To them we turn for encouragement and help.

I am going to relate a true circumstance that took place last week in a little rural district. Six ladies met at the home of a bright little woman to help her quilt. They were all farmers wives, and of course the general topic soon developed into housecleaning and spring work. This clever little hostess possessing more organizing ability than is alloted most women, proposed that they organize into a general Improvement Club for the purpose of beautifying their premises—their home grounds in particular. This she had been encouraged to do from an article she had read in the Maritime Farmer, entitled "House Cleaning and Tree Planting." The idea met with general approval, and the afternoon was spent in discussing how they could best manage their grounds, plant trees, shrubs and vines. Now this is just the time for this kind of work, and in nine cases out of ten unless the women take an interest in these things they go undone. At this season of the year, the farmer is too busy getting ready for the seeding to spend much time about the house and yard.

But we can, and why not do it—and do it now. Mothers, interest your boys in the planting of trees, shrubs and vines. Then the farm house that stands in the middle of the field so bare and naked, will take on the appearance of cosiness, and the stranger passing will be impressed that peace, plenty, and happiness reign therein.

Will feel also that a warm welcome and a good meal awaits them at any time. If these six ladies carry out their idea as they pledged there will be lots who read the Farmer that can point their finger to the very districts, the improvement will be so marked.

"Come, let us get nearer to nature and thus nearer to God."

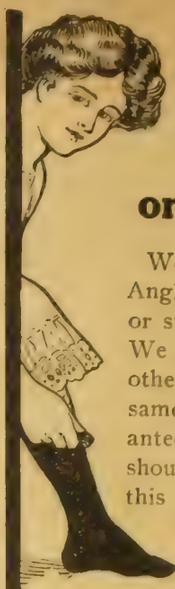
AUNT BETTY.

A Woman's Ideal Husband.

First of all I desire him to be a thorough gentleman—by this I do not mean he must be highly educated, neither is it necessary that he be of high birth and a man of wealth but a gentleman in the truest sense of the word—first of all a manly man loyal to himself and to every man, woman and child that he comes in contact with and always kind, courteous anh thoughtful of both mankind and all living creation.

As a citizen he should be public spirited, interested in the welfare of his own community, also that of the town, State and Nation. To this end he should be in touch with vital affairs to such an extent that he can vote intelligently, and be broad-minded enough to cast his influence on the side which he considers to be right, regardless of party lines or creeds or pocketbook pressure.

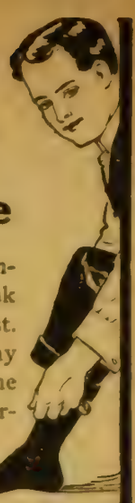
As a husband, loyalty should be his gdiding star, not that he must forego all pleasure unless shared by his wife, not that he must give up



Guaranteed to Wear Longer

or you get 2 pairs free

We guarantee the following lines of Pen-Angle Hosiery to fit you perfectly, not to shrink or stretch and the dyes to be absolutely fast. We guarantee them to wear longer than any other cashmere or cotton hosiery sold at the same prices. If, after wearing Pen-Angle Guaranteed Hosiery any length of time, you should ever find a pair that fails to fulfill this guarantee in any particular, return the same to us and we will replace them with TWO new pairs free of charge.



Let us again remind you that we guarantee the following lines of Pen-Angle Hosiery to outwear others. That means the best wearing hosiery sold anywhere.

The reason why they will wear longer is because of the exceptional quality of the cashmere and cotton yarns we use. And because we knit them on Penmans' exclusive machines. We have the sole rights to use these machines in Canada.

They're Seamless

These machines form-knit the hosiery to fit the form of the leg, ankle and foot perfectly, without a single seam anywhere to irritate your feet or rip apart.

They reinforce the feet, heels and toes—the places that get the hardest usage—without you ever being aware of any extra thickness.

You see, these machines increase the wear resistance of Pen-Angle Hosiery and at the same time make them more comfortable—your ideal hosiery.

Make up your mind right now that you will never again buy hosiery with horrid seams up the leg and across the foot—hosiery less serviceable—but get Pen-Angle 2 for 1 guaranteed hosiery.

For Ladies

No. 1760.—"Lady Fair" Black Cashmere hose. Medium weight. Made of fine, soft cashmere yarns, 2-ply leg, 5-ply foot, heel, toe and high splice, giving them strength where strength is needed. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1020.—Same quality as 1760, but heavier weight. Black only. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1175—Mercerized. Same colors as 1720. Box of 3 pairs, $1.00; 6 pairs, $2.00.

For Men

No. 2404.—Medium weight Cashmere half-hose. Made of 2-ply Botany yarn with our special "Everlast" heels and toes, which add to its wearing qualities, while the hosiery still remains soft and comfortable. Black, light and dark tan, leather, champagne, navy, myrtle, pearl gray, slate, oxblood, helio, cadet blue and bisque. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 500.—"Black Knight." Winter weight black Cashmere half-hose. 5-ply body, spun from pure Australian wool. 9-ply silk splicing in heels and toes. Soft, comfortable, and a wonder to resist wear. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1090.—Cashmere half-hose. Same quality as 500, but lighter weight. Black only. Box of 3 pairs, $1.00; 6 pairs, $2.00.

No. 330. — "Everlast" Cotton Socks. Medium weight. Made from four-ply long staple combed Egyptian cotton yarn, with six-ply heels and toes. Soft in finish and very comfortable to the feet. A winner. Black, light and dark tan. Put up in boxes. Box of 3 pairs, $1.00; 6 pairs, $2.00.

Instructions

If your dealer cannot supply you, state number, size and color of hosiery desired, and enclose price, and we will fill your order postpaid. If not sure of size of hosiery, send size of shoe worn. Remember, we will fill no order for less than one box and only one size in a box.

Catalog Free

If you want something different than the styles and shades listed send for handsome free catalog which shows an extensive line in colors. 44

Pen-Angle Hosiery

WARRANTED HIGH PENMANS GRADE HOSIERY

Penmans, Limited, Dept. 45 Paris, Canada

all thought of others but that in thought, word and deed his life may show his affection and constancy. This may and should be done in a quiet fashion. It is only in the inner home circle that endearments and a full expression of love should be manifested but it is important that in the right place and at the proper time affection should be given full expression, if stifled and shut out it will die down and possibly, nay probably, disappear even as a plant will die without light and air.

As a father he should possess patience and tact no less than is expected of a mother. He will need a retentive memory, an imaginative mind and a firm but gentle spirit. He will need these qualities that he may temper his judgments by thoughts of his own youth, that he may discern, to some extent, the fancies of his children and that he may command obedience by love and justice rather than by brute force. Furthermore he should have a young heart, a hearty laugh and a deep love for children.

In short, my ideal husband is clean morally and physically—a busy, hearty and happy man, a person to be loved and thoroughly trusted by all who know him. Upright, honest, fearless and cheerful he meets life courageously and quietly in whatever phase it presents itself and is a rock of strength to his wife and little ones.

This ideal husband is placed on a high standard, as most ideals are and should be, and yet I have known at least two men in my life who will fully measure up to the requirements of this article.—O. B. Cheerful, in Maine Farmer.

Teachers Need Mothers Aid.

The National Anti-Truancy Association, at its last annual meeting, had this bit of advice to give mothers as to children who deliberately play "hooky" from school.

"It is not the teacher alone who can make school so attractive that the child will not become a truant. Nor can the law regulate every case of truancy. There must be aid from the home, and more of this must come from the mother than the father, since the mother usually has the closest contact with the child. For a mother to show interest in a teacher's work by knowing her personally and regularly visiting the school, is one bar to truancy. Bringing the teacher into the social life of the pupils home, is another bar. A third and most important bar would seem to be set up through the mothers taking a daily interest with the child in its own school work. No child, observing these three different attitudes of the mother, can ever become a truant."

Rhubarb Vinegar.

For ten gallons, take twenty-five ordinary sized stalks of rhubarb, pound or crush with a piece of wood in the bottom of a strong tub, add ten gallons water; let stand twenty-four hours; strain off the crushed rhubarb and add eighteen pounds of sugar free from molasses, and a teacup best brewer's yeast; raise the temperature to 60 or 80 deg., and put the compoubd into a twelve gallon cask; place it in a position where the temperature will not fall below 60 deg. In a month strain it off from the grounds, returning it to the cask again, and let it stand till it becomes vinegar. A. A.

Two Little Old Ladies.

Two little old ladies, one grave and one gay,
In the self-same cottage lived day by day.
One could not be happy, "Because," she said,
"So many children were hungry for bread."
And she really had not the heart to smile,
While the world was so wicked all the while.

The other old lady smiled all day long,
As she knitted, or sewed, or crooned a song.
"She had no time to be sad," she said,
"When hungry children were crying for bread."
So she baked, and knitted, and gave away,
And declared the world grew better each day.

Two little old ladies, one grave and one gay—
Now, which do you think chose the better way?

Children and Wild Flowers.

Nothing pleases the children better, and certainly nothing is more delightful for the mother, than a day spent in the woods and meadows with the wild-flowers. These "family picnics," as we call them, are a regular feature in our neighborhood. Two or three families, the mothers and children, at least, make up the party, baskets are filled with lunch, and we are off for the woods before the sun is fairly up. Such a time as we have!—picking strawberries, gathering flowers by the armload, and all the while trying to keep pace with the children, who become veritable wild things as soon as they get out in the open. It is invigorating refreshing, this thing of getting out in the woods and being bathed from head to foot in the sweetness and fragrance of spring.

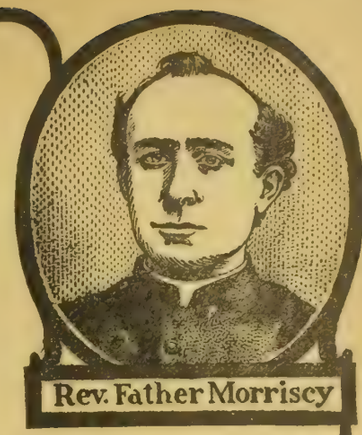
BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

A Positive Cure For Rheumatism



Rev. Father Morriscy

For many years, both during Father Morriscy's lifetime and since he passed away, his No. 7 Tablets have been curing many of the worst cases of rheumatism in Eastern Canada.

During his lifetime it became the custom, when people could not get relief from other sources, to consult Father Morriscy, and few indeed did so in vain. His standard prescription came to be called

Father Morriscy's No. 7 Tablets

and it can now be procured from any druggist or dealer in medicine.

No. 7 Tablets act directly on the kidneys, stimulating them so that they can remove from the blood all the Uric Acid, which alone causes the rheumatism. Two or three weeks' treatment cures ordinary cases, while with the worst chronic cases it seldom takes more than three or four boxes of No. 7 Tablets to thoroughly eradicate the rheumatism from the system.

In every case, right from the start, the sufferer gets relief from the torturing pains and aches.

We would be glad to refer you to one-time rheumatics, now well through taking Father Morriscy's No. 7 Tablets.

Erysipelas Cure.

A Canadian relates how his father was afflicted with erysipelas from the time he was a young man until past fifty years of age. An honest physician, and there are thousands of his kind in the world, after two days search of all the authorities he had in his possession, told the old gentleman to go home and purchase some flour of sulphur and some molasses, to mix the two to saturation, and to take the compound three times a day until cured, which might take three or more months. The patient was completely cured, and lived to the ripe old age of ninety years, ever after being one of the healthiest of men, the Canadian declares.

The Visitor's Bedroom.

Unless a chest of drawers and some hanging hooks are provided for the use of a staying guest, she is bound to keep the bulk of her clothes in her box, with a miscellaneous assortment of articles lying about the dressing-table. It is impossible to keep everything one needs out of sight in a box; they get tumbled about in hopeless confusion every time a search is made for something. Under these circumstances the bedroom quickly assumes a very untidy appearance. I have had a dress-skirt hanging on one bedpost and a soiled linen bag on the other, another dress skirt suspended from the back of an armchair, and two blouses laid across it; writing materials on another chair, my needlework on an ottoman, and the dressing-table completely covered with necessary articles of the toilet, etc.

Having made suitable apology to the hostess for the apparently disorderly look of the room (really not disorderly, but the reverse, only that nothing was hid behind doors or under lids), one can scramble along comfortably enough for a week or two; but difficulties arise for the guest when a servant or the mistress of the house persists in tidying up. I know one hostess who cannot permit her guests the privacy of their room or the control of their possessions. Lay your veil on the dressing-table, and when next you think to pick it up it is gone. Fold some article of clothing neatly upon a chair, ready for use in an hour or two, and when next you enter the room it has been spirited away, and you must search out the lady and ask her where she has put it. This is carrying tidiness to quite illegitimate lengths. Another very tidy housewife says in this connection, "However particular I may be myself, I never interfere with a visitor's bedroom. If things are straightened up, none of her belongings are put out of sight."

"ORANGE LILY SAVED MY LIFE"

These words or expressions having the same meaning are contained in hundreds of the letters I have received during the past year. Many were from women who had suffered agonies from falling of womb; others from women who had escaped dangerous surgical operations, as the tumors and ulcers had been removed by the action of Orange Lily; and others who had suffered from suppressed menstruation, leucorrhoea, painful periods, etc. For all these and the other troubles known in general as Women's Disorders, Orange Lily furnishes a positive scientific, never-failing cure. It is applied direct to the suffering organs, and its operation is certain and beneficial. As a trial actually proves its merit, I hereby offer to send, absolutely free, a box worth 35c., sufficient for ten days' treatment, to every suffering woman who will write for it. Enclose 2 stamps, MRS. FRANCES E. CURRAH, Windsor, Ont.

OCEAN MILLS, Mount Royal and Lasalle, - Montreal. Que.

Like Attracts Like.

Did you ever think that the thing you are looking for is looking for you; that it is the very law of affinities to get together?

If you are coarse in your tastes, vicious in your tendencies, you do not have to worv very hard to get with coarse, vicious people; they are seeking you by the very law of attraction.

Everywhere affinities are seeking one another. When boys and girls go to the city for the first time to seek positions, how quickly they find their affinities.

Those who are naturally wild, and those who wish to dissipate, do not nave to look very far or very long to find those with the same coarse, animal tastes.

Watch country youtns who go to the city to seek their fortunes.

Some seek the Young Men's Christian Associations, some the churches; some the saloons and the dance halls. Those with mdsical tastes very quickly get into a musical atmosphere. Those with artistic natures gravitate naturally to other artistic temperaments.

Our thoughts, and motipes, our desires, our longings, are forces which find their fellows.

How Shall we Keep the Boy's Heart in the Home.

Every mother confronts vital problems which she must solve single-handed. She may be well read, well informed as to food values, physical culture, home remedies, and her education may even extend well into various practical lines. Nevertheless she will meet circumstances and conditions, the judicious treatment of which may mean so much, not only to her, but to her family, and to deal with these she has only her own experience, ingenuity, tact, motherly love and common sense. Many a mother, though she may not speak of it, finds these difficulties tracing lines of worry in her face and aging her by years.

Let us look straight into one such problem. "How shall we keep the interest of our boys in the home?" Every mother wants her boy to meet people and learn his place in the world. To do this it is absolutely essential that he see what other homes, other individuals are doing, and one very good way to personally enjoy this branch of a son's education is to invite his friends to the home.

Parents frequently set themselves upon a pedestal of authority, when the hand and advise them and devise with them, which will in no they should take their children by way depreciate parental love, but, on the contrary, will inevitably strengthen it and foster individual effort and a love of co-operation between parents and children. Children should be encouraged in reasonable "hobbies," particularly those of a practical nature. A financial interest in the farm often spurs a young man as nothing else will.

No boy has a right to be turned loose upon the public without a knowledge of the ten commandments for his moral guidance. The principles of justice must be instilled into every sturdy fibre!

The boy has to know himself. He has a body, a mind and a soul, each of which needs food for growth. Without a knowledge of the body, which not infrequently is so badly neglected, he is no safer than if placed in a running railway locomotive. If the line is straight, he may meet no serious accident, but most lines have sharp curves, stops, and not infrequently, obstacles in the way. Prepare him for these. Teach him botany. Teach him physio:ogy. Give him to understand tnat his body is a very fine machine, loaned him for a time that he may by living, bring character and usefulness into his own life and into the lives of others.

Give him facts as he is ready for them. Teach him that obedience to nature's laws means health; that their violations means disease. Even the boys in a well regulated home should have a fair grasp of food values and their relation to health. This is one of the questions at the base of all morality. There is more sin and sorrow directly resulting from incorrect diet than from all other causes combined. Bad food and drunkeness cause disease. Disease weakens the mind and dulls the morals, and henceforth a train of evil follows, till the radical causes are corrected.

Place good books in the hands of your boy. If he doesn't take to "Pilgrim's Progress," perhaps he may derive as much good from David Copperfield, or vice versa. But next to his Bible let him have such books as "What a Young Man Should Know." One-half the crime illness, sorrow and sin of this world would never be known were it not lor ignorance concerning those things which is our rightful inheritance to know. Give your boy the knowledge which will enable him to shun evil.

The organ, piano and violin are most excellent companions. The latter instrument is not limited to dance music. It is the queen of musical instruments, just as the pipe-organ is king. The violin lends to sacred music a delicacy and sweetness all its own. Music satisfies the hunger of the emotional nature and through it we may come in touch with the noblest thoughts translated in tone.

It must be borne in mind that boys are so much unlike that entirely different methods must be used in their education. To determine the best method for a certain case, one must know thoroughly his traits of character and base thereon one's line of action.

Some boys yield to constant gentle persuasion, others resuond to stern dicipline; many give their best when put in charge of and held responsible for others, for instance, their younger brothers and sisters, or their comrades in school. How often a boy turns right about face, when made president of a Band of Mercy, a literary club or similar organization. A love for British fair play takes hold of him and calls him to higher responsibility.

Then there is the young man who must have the facts of life before him. He is not satisfied with what other people tell him. He resolves to see what others know as good and what others know as evil. The owner of such a disposition places himself in constant danger. So many young men needlessly mar their lives in gaining a knowledge of the facts of life. He who returns "unspotted from the world" will, like Padl, be so convinced of the power af good and the hideousness of sin that he will be a stronghold for good.

He cannot—with very, very few exceptions—do so, however, without a thorough grounding in the principles of a Christian home. He must have a mother who loves and trusts and expects great things of him and frequently tells him so. He must have a mother who constantly prays for him. Prayer is a service of love, deeper, stronger, farther reaching than any of us know.

In Case of Accidents.

It may be that you will never be called upon to administer in cases of serious accidents or poisoning through carelessness, as mistakes in taking medicine. But it is important that every one be familiar with proper steps to pursue and antidotes for the most common poisons. In the country oftentimes a physician cannot be reached for hours but with a little medical knowledge you will sometimes be able to save a life. First and foremost, don't lose your head and frighten the patient but do quickly wnat needs to be done.

When an artery has been cut tie a cord between the wound and the heart retarding bleeding as much and as quickly as possible. The knot of the cord should come directly over the artery. Another way to stop bleeding is to press both edges of the cut together firmly or thrust the hand into the wound. Always remember that the very first thing to do is to stop the bleeding.

It is a splendid thing to have various sizes of bandages on hand which can be obtained at any moment. Worn out pillow slips or old pieces of sheeting are best for the purpose. They should be torn into long strips, rolled neatly, and put into a handy place. Where there are children they will be called into use very often.

In cases of fainting lay the person on his back with his head as low as the body. Dash cold water on the face to stimulate the spinal nerves which will hasten the action of the heart. The heart action will become stronger shortly and consciousness regained. If the room is hot and close carry the person into the open air.

Every one should know how to proceed to save a drowning person. Lay the person on his back with his head lowest. Stand at the head and draw each arm outward and uuward in a semicircle away from the body until they are stretched above the head almost in a line with the

They Cost But 9c. Per Square Per Year

PRESTON SAFE-LOCK SHINGLES

You pay but $4.50 per square for PRESTON Safe-Lock Shingles. Allowing for 50 years of service their cost per year figures out as 9c. per square Wooden Shingles and Prepared Roofing only give from ten to twelve years' service. Their cost per year is from 29c. to 35c. per square, according to the grade of roofing or shingle you buy.

PRESTON Safe-Lock Shingles are galvanized so as to pass the British Government's Acid Test. Shingles that will pass this severe test are practically everlasting. PRESTON Safe-Lock Shingles should last over 100 years, which would bring their cost per year down to less than 4½c per square.

No other roofing can compare with PRESTON Shingles as an investment. No other is good enough for that new barn you are soon to erect. With no other roofing will you get a Free Lightning Guarantee.

Before making any decision as to the kind of roofing you will buy get a copy of "Truth About Roofing." It tells the truth about the different roofing materials on the market. Contains information you would be willing to pay for. We will send it free, providing you fill in and send the coupon promptly. Send it by next mail. 10

Bowmanville, Ont.

body. Then carry the arms directly forward and down and press them against the side of the chest. These movements should be repeated about 15 to 20 times a minute or at the rate of natural breathing. Sometimes by pressing and kneading hard upon the chest a great deal of air will pass out of the chest. Never hesitate attempting anything to bring about artificial respiration for sometimes ignorant attempts result in saping a life.

Hardly any accident is more common than poisoning either by intention or by mistake. Often there are symptons of poisoning when the patient cannot or will not say what he has taken, thus it is important that we know some general directions for treatment.

1. Make the person vomit at once. To do this tickle the throat with the finger, pass a feather through the nose when the mouth cannot be opened or give him a teaspoonful of mustard mixed with a cupful of hot water.

2. If the poisoning is not discovered for several hours give castor oil or salt to remove any poison which may have entered the intestine.

3. Give the antidote for the poison which will destroy the poison left in the body.

4. Then give a weak stimulant, for the person is very weak and tired.

5. Rest and quiet, a low diet, and the reclining position should be kept for severa, days.

Strong coffee is the best general stimulant and should contain neither sugar nor cream.

If a large amount of pure carbolic acid is swallowed it produces violent and rapid death. A stomach pump will generally have to be used to remove the poison.

The Farmer's Wife.

There are people in the world who look upon the work of the farmer's wife as drudgery. It is not such. Neither is the farmer's wife a drudge nor a slave. Our work is not hard only as we make it so; look back and see what our mother's work was. I remember very distinctly how my mother made butter and cheese, how she used to spin and weave beside doing all of the knnitting and nearly all of the sewing for the family. The families then were by no means small. Did she consider her work drudgery? No, she was working for her husband and children and no woman unless she is working for self alone can call it such. Love lightens labor. We have no spinning or weaving to do; few are the women who make butter or cheese; and many are the women who do not know how to knit.

We have large kitchens with every convenience, hard wood floors that are easy to keep clean, and machines with which we can do our washings in two hours' time. No, our work is light, compared with what our mothers' was.

The farmer's wife had much rather do her work herself than hire it done, and she much rather have the care of her little ones than trust them in the hands of a servant.

How much a woman on the farm has to enjoy that a city woman does not have! She has fresh eggs to cook, good new milk to use, plenty of apples and potatoes, a good garden, and berries of all kinds which she enjoys picking herself.

The farmer's wife is interested not only in her home, but in the church, the school anh the Institute as well.

With all these pleasures and with the free delivery which brings her so many papers and letters from friends, she ought to be and, I believe is, one of the happiest women in the world.—Maine Farmer.

NEW SCALE WILLIAMS

Before leaving Canada, we want to thank you for the "New Scale Williams" Piano you furnished for the Dresden Orchestra, both in Hamilton and Toronto. *This is certainly a wonderful piano*, and if we can always have as good an instrument we will be perfectly satisfied. *The tone is rich and mellow, and the sustaining powers are equal to anything we have ever heard.* Again thanking you, and congratulating you on your success in producing such a beautiful tone, we are, sincerely yours, WILEY OLSEN,
Cond. Dresden Philharmonic Orchestra.
VICTOR ILA CLARK, Assoc. Con.
Dresden Philharmonic Orchestra.

The Famous Louis XV Model of
New Scale Williams Piano

This exquisite piano is one of our newest and finest creations, and makes its strongest appeal to all lovers of the artistic.

It is beautifully hand carved in keeping with the Louis XV period.

Musically and mechanically, this model stands as the perfection of the piano builder's art.

Pianos Sent On Approval

Leading piano houses have the New Scale Williams Pianos. If we are not represented in your city, we will ship direct from the factory, giving you the privilege of returning the piano if you are not pleased with our selection.

Bonusing the Dairy Cow.

During the absence of our editor who was called away owing to serious illness in his family several typographical errors crept into the following article in last issue, which made it sound rather erratic. We are therefore republishing it in the corrected form.

Editor Maritime Farmer:—

I was pleased to see a correspondent's further comment on the bonus question for dairy cattle.

I refer to the letter from my friend Mr. Peters, in your last issue.

I am going to ask you for space in this issue, for fear any of your readers should notice the amount of money which my friend Mr. Peters, seems to be under the impression I stated would be required as its first item, namely, three hundred thousand dollars.

This amount would perhaps be a paralizer. What I did say was that it would require, under the estimate I made up, from $30,000 to $40,000 to try it for one year.

This estimate was made up as follows: In order to give each county a chance simultaneously, would require fifteen Inspectors, one for each county.

These I estimated at $1000 each	$15000.00
I further estimated that these fifteen could inspect or check up in the neighborhood of 500 cows for two milkings once each month (this would vary according to the distances apart the herds entering would be). This would make 7500 cattle available to compete for Bonus and in order to be prepared that all would succeed in making 4000 lbs. milk and 160 lbs Butter Fat and the Bonus says $3.00 per cow would leave the Dept. open to have to furnish	$22500.00
Or a total of	$37500.00
To which might be added some incidental expenses say	2500.00
Or a grand total of	$40000.00

It is not, however, to be expected that all, those entering will be successful and make the required amount, but of course the Department would have to be prepared Then your readers will understand the amount required to qualify is to be raised each year 1000 lbs., that is, if the scheme proved workable and productive of good results it would be carried on for five years, making 5000 lbs. the minimum the 2nd year, 6000 the 3rd year, 7000 the 4th year, and 8000 the 5th year.

My own opinion is, the amount to be paid bonus each year would rapidly grow less as the amount required to qualify increased, so that the Bonus money would not necessarily grow excessively burdensome and yet the result required would be attained, namely ascertaining the productive value of your cow machine.

Now it is quite true that this weighing should be done without this incentive' but the fact remains that it is not done in one case in ten, and yet the Department and Institute speakers have been preaching it for years and years, and instead they are leaving the dairy and going at the wheat and I am strongly of the opinion that nothing short of the Bonus dollar will wake the majority up to the fact that they must know what the machine is doing if they are to continue putting the costly feed of today into that machine.

I am quite willing to admit that it is some trouble and expense to

"the finish" "that endures"

ML Floorglaze

gives woodwork a surface glass-hard, mirror-bright, beautiful, lasting. Fine for floors, because M L Floorglaze can't be marred by boot-heels, castors, nor chair-legs. M L Floorglaze stays glossy; you can wash it with soap and water as you'd wash a window; it doesn't fade; it stays new and bright longer than anything else you get. Easy to put on M L Floorglaze—do it yourself—it dries hard overnight. Renovate with M L Floorglaze.

M L FLOORGLAZE comes in tins of just the size you want. Seventeen colors in solid enamels. Seven other colors in Lacs that admirably imitate hardwoods; and also a Transparent (natural finish) M L Floorglaze. Coat 500 square feet with a gallon. Just ask your dealer, or drop us a post card for news of a hundred uses your home has for the finish that endures.

Hay Carriers, Litter Carriers etc.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Construction of Wharf at Shediac, N. B," will be received at this office until 5 00 P. M., on Thursday, May 26, 1910, for the construction of a wharf at Shediac, Westmorland County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department, at the office of E. T. P. Shewen, Esq., District Engineer, St John, N. B. Goffrey Stead, Esq., District Engineer, Chatham N. B., and on application to the Postmaster at Shediac, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, with their occupations and places of residences. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, made payable to the order of the Honourable the Minister of Public Works, for the sum of two thousand one hundred dollars ($2,100.00.) The cheque will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By Order,
NAPOLEON TESSIER,
Department of Public Works,
Ottawa, April 26, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

NO BETTER TIME for entering than just Now

St. John's summers are so cool, our position so elevated and our rooms so well ventilated, that we do not find it necessary to take a summer vacation, and we have good classes during the warmest weather.

Also, students can get more attention than in winter, when our rooms are crowded.

Send for catalogue.

If you have pure bred stock of any kind for sale, it will pay you to advertise in these columns.

weigh, especially at 5 a. m. of a winter's morning, with a half blackened lantern globe as the only light and one's own eyes about half opened and perhaps in the spring of the year you have been up half the night looking after a new calf—or staying by the ewe with her new lamb, etc., and yet to accomplish the desired result today you must introduce and keep up some business methods in order to keep in the competition at all, as one cannot farm today and meet competition under the same system as our forefathers or our old veteran friend, Donald Innis, did.

Because where Donald, 30 years ago could get along with a scythe @ 60c, we must have a mower @ $60.00, and where he had a hand rake at 25c, we must have a horse rake at $25.00, and so on, or if we don't its the Sheriff that would be knocking at the door instead of Donald's Woodpecker.

I myself started out to make a living from the dairy cow, some 27 or 28 years ago, but like a good many more I got discouraged, because having a very limited capital, I did not seem to get ahead and finally drifted away from it and found it easier to make a profit in other lines. I thought at that time the trouble was with the country itself. After seeing other countries I found out there was nothing much wrong with this country and after some more years of investigation, I am satisfied the dairyman's greatest trouble is in the lack of knowledge of his production, and the fact that he is only producing with two machines about as much as he should produce with one. This can only be verified by careful weighing and testing year after year—breeding only those which are producing paying quantities and weeding out those which are not.

Think what this expenditure of $40,000 would do. It would produce a definite knowledge of what 7,500 animals, at least, were doing.

It would encourage, at least, 700 or 800 dairymen each year to a larger and heavier production, with practically no more cost. If the money were spent, it would all be spent within the country and return to every business interest in the country. It would enable the wholesale distributor of the product to reach out and get a foreign connection to export to, inasmuch as he would feel safe that the production was going to keep up at least for five years and right here is one of the dairyman's hardest set backs, for after all this is only a very narrow and limited market here in New Brunswick, because our buyers after all can only handle a very limited volumn of trade and while it is true that they have to go outside to-day for some dairy and hog products and consequently pay a high price, yet when we all get to producing on those lines, it does not take long for our limited market to get overstocked and the price to tumble down, along with which tumble comes the discouragement to the producer.

One cannot, perhaps, blame the wholesaler, for in the past, if he should attempt to start for an export connection, the very next season he is confronted with a shortage and he is unable to make sales.

If, on the other hand, he was assured of a continuous increase, so he could make his foreign connection, or export trade, he ought then, in his own interests, to keep up a fair market price, knowing that he would be able to sell and increase.

It is in this direction that we are different from our neighbors in the Upper Provinces, inasmuch as they have a much larger, more expansive market and buyers than we in this smaller market.

I, myself, have seen pork, for instance, which is part and parcel of the dairying, in the St. John market start, say, at 9c in the fall and before the river navigation close go down to 5c, simply because the buyers quickly got all they could handle, or apparently so.

So far as the need of this bonus or

This Serviceable "Swiss" Army Rifle For $3.50

We have in stock about twenty of these "Swiss" Army Rifles which we would like to dispose of. Having purchased a large number of these rifles for premium purposes we necessarily got them at a bargain and are now offering them to you at wholesale prices. The shooting season is over and we do not want to carry so many in stock. They retail at all hardware stores for about $6.00 each. Ammunition for these rifles is cheap and can be obtained at almost any hardware store in the provinces. If your dealer does not keep it we can get it for you- Every farmer should have a rifle and this is your opportunity. Better send for one to-day. They will not last long at the price quoted, $3.50. Orders filled in rotation. If all are sold when your order is received money will be refunded. Order to-day. Cash must accompany order. If you send check add 25c for exchange.

The Maritime Farmer

SUSSEX, - N. B.

encouragement is concerned, I think all will agree, especially when you stop to see the way our ranks are being depleted and the farms abandoned of stock raising and the rush to the wheat fields. In many parts of this, the Banner County of Kings, so called, it is going on to an alarming extent, and mind you the Dominion Government is practically bonusing them to go by giving them 160 acres of workable land, that with willing hands and a pair of horses, will produce a profitable crop in one year's time.

Do your readers and our representatives in the Government know and realize that our dairy production, throrgh the creameries, has decreased over 200,000 lbs. of butter from what it was two years ago ?

Think of what that means !

Some of it may perhaps be accounted for by being made at home on the farm, but still it ought to be increasing both on the farm and in the creamery.

Twenty years ago Denmark was exporting $7,000,000 worth of butter, while last year she exported $45,000,000.

Incidentally I might mention that the same increase is visible in all her farm products, brought about principally from the fact that she maintains almost a thorough agricultural policy, and there are at the present time some 24 members of its government, who are practical farmers, who know what they want and who assist the agriculturist in every possible way.

The possibilities of this dairy industry in the province of New Brunswick are enormous, if it is once put on a profit producing basis. We can raise crops here equal to any part of Canada, unless it may be one or two grain crops. What we need is to get our own people on their feet.

The time is coming when the West will look to the East for dairy cattle, in fact I have the proof of this on my table before me now in an enquiry for a carload of Ayrshires for Wyoming (this comes in response to my ad. in your excellent paper, and reaches me only about one week after the paper was issued.) They go on to state that they shall have to look East for dairy stock. This will, no doubt, be much truer as time goes on, for with so many cutting out the live stock and going into the wheat raising, it will not be long before their soil will become depleted and the wheat market eventually overstocked, because in cutting off the live stock, they are cutting down one of their heaviest customers for grain and grain products and will surely eventually drive their own market price down. Already I read of a large percentage of last year's grain being held by the farmers themselves. Let us then get some stimulation from this bonus. Get our herds in better shape and be ready for stocking up our old neighbors when they come East for some good milkers, by that time we will have records to show them of just what profit producers we have.

I already have many converts to this idea and will be glad to hear, through your columns, of many more and if we stand shoulder to shoulder, it will surely come, for after all, our representatives are only elected to carry out our wishes, and it is surely the farmer's turn for something now. He has been patted on the back long enough—told he is the backbone of the country—made to pay his share of the taxes, which in the end, pays the subsidy for new railways. Pays the subsidy for new steamship lines. Guarantees the interest on cold storage warehouses for the capitalist. Pays the bonus on the steel making. Pays the bonus on the iron production. Pays the bounty to the fisherman and other items too numerous to mention.

Now let us have a turn and have a bonus on the dairy cow production.

I am no politican and do not know the ways and means required to raise the amount, but I say if it can be done for every other industry, the way can be found to do it for this, when in the words of Chancellor Jones, of the U. N. B., say :

Fish in N. B. is worth.....$6,000,000
Lumber in N. B. is worth..... 7,000,000
Agriculture is worth..... .. 20,000,000

Add to this the fact that our specially appointed commission honestly report a decline in almost every branch of the business, in every section they visited and I think you have all the food necessary to demand a radical change of some sort.

In order that all your readers may have an intelligent idea of the proposed bonus, I submit details as follows :

That a sum not exceeding $15,000 be granted for the remuneration of fifteen inspectors, one for each county, whose duty it shall be to visit each herd that may enter for the bonus, once each month during the year, there to inspect the weighing of each cow's milk that is entered in the test, both night and morning. Also to test the milk for butter fat. That said inspector shall be a capable, practical man, expert enough to give instruction and advice regarding breeding, feeds and feeding, when called upon to do so.

He shall also be required to take an accurate census while passing through the county of the live stock, crops and any other stasistics that may be required. That a further sum, not exceeding $25,000, be granted for the purpose of paying a bonus of $3.00 per cow to all cows qualifying for the following production each year :

1st year all making not less than 4,000 lbs. milk or 160 lbs. butter fat.
2nd year all making not less than 5,000 lbs. milk or 200 lbs. butter fat.
3rd year all making not less than 6,000 lbs. milk or 240 lbs. butter fat.
4th year all making not less than 7,000 lbs. milk or 280 lbs. butter fat.
5th year all making not less than 8,000 lbs. milk or 320 lbs. butter fat.

That this plan be put into effect for one year first, as a trial and if found productive of good results, that it be continued for four years longer, or five years in all.

This, in brief, is the scheme as outlined. The amount required is a mere bagatelle if it will put the industry on its feet for there are over 60,000 people directly and indirectly interested in this line in the province of N. B , and I believe I am within the mark in stating that at least 75 per cent. are discouraged to-day and I further believe it is because they do not realize that they are feeding two cows to get the same result they should get from one.

At the end of five years those entering for bonus would know just where they stood, would know just what their machines were earning and whether they could afford to keep them or not. The machines that were producing would have some value.

At present the average cow changes hands at about $30 to $35, the buyer has nothing to go by except his judgment, and that is often like telling a horse's age after the marks have gone off his teeth.

He will invariably be told "she will fill a pail," but he forgets the long time she goes without filling a pail.

Prof. Cummings says: "The average production in the Maritime Provinces is 3,000 lbs." That would make, on an average, 120 lbs. butter fat, worth an average of $30 for a year, while she will cost, in feed alone, that much money.

TRADE B MARK

Amatite ROOFING

A Frank Statement

HOW many manufacturers of ready roofing will tell you frankly how their goods are made ?

Mighty few.

They will talk about "secret formulas," "special waterproofing compounds," etc.—ALL NONSENSE.

They don't tell you what the goods are made of because they don't dare.

From the start we have never hesitated to tell the buying public just what Amatite is made of and just what it will do.

How Amatite is Made

Amitite is made of two layers of COAL TAR PITCH—THE GREATEST WATER PROOFING MATERIAL KNOWN,

Alternating with these two layers of pitch are two layers of coal-tar-saturated WOOL FELT to give it tensile strength.

On top of these four layers is a REAL MINERAL SURFACE—five layers of protection.

The mineral surface is permanent, fire-proof, and ABSOLUTELY REQUIRES NO PAINTING.

It Needs No Painting

Roofings that require PAINTING are a worry and an expense. Every year or two you have to climb up and give them a coating with some special compound sold by the manufacturers, or you are pretty sure to have a leaky roof.

Amatite is Making Good

We are constantly receiving letters from customers telling us how satisfied they are with Amatite—how much better it is than the old-fashioned roofing.

Year after year, in all weather, Amatite will give you perfect service without any painting or attentionlof any kind.

Surely this is the kind of service that wins and keeps customers.

Free Sample

Before you go to your dealer and buy a roofing, we should be very glad to send you a sample, so that you can see for yourself just what we are talking about—what a solid, substantial, reliable roofing we are offering to the public.

Something Back of It

Remember, in this connection, that Amatite is made by the LARGEST MANUFACTURERS OF ROOFING MATERIALS in the world, and that when you buy this roofing there is something behind it. We stand back of every roll. We know we are offering the best and the most economical ready roofing on the market.

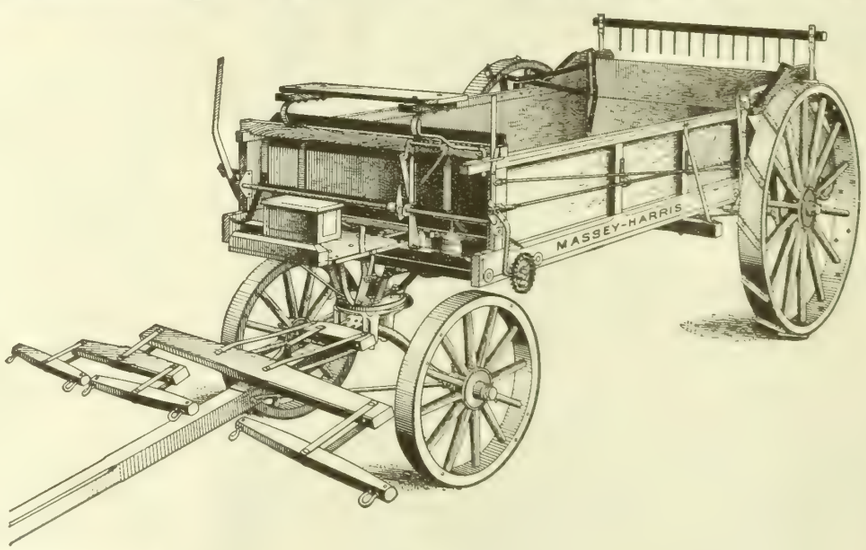
For the sample and booklet address our nearest office.

The Carritte-Paterson Manufacturing Company, Ltd.,

St. John, N. B. - Halifax, N. S.

Amatite on Lumber Sheds of B. F. Harris & Sons, Brushton, N. Y.

Massey-Harris Manure Spreader.



Built very strong because it must carry heavy loads over ground that is often rough and frozen.

Has a Spiral Beater which spreads the manure evenly.

It is simple and easy to operate so your boy can use it as well as you.

It is durable and will last a long time

It is one of the most profitable **Investments** you can make—not an expense.

THE MASSEY-HARRIS CO., Limited, Moncton, N. B.

Is it any wonder that the majority are discouraged ?

Can anyone afford to sell any kind of a dairy cow for $30.00 ?

Supposing she drops her first calf and begins to produce at 2½ years old. He would have to feed and care for her for at least two winters of eight months each or 16 months in all, that would be 480 days and if it was only worth five cents per day, including feed, she would cost $28 00 before she began to produce and it ought to be worth that much to tend her twice a day, to say nothing of feed.

Before closing I also want to remark regarding the letter in your last issue re Help and Scotchman.

I do not believe it is half as hard to get help on the farm, as it is to pay them from profit off the farm, when you do get them I also believe many of our own province men are fully as good help as the imported, though, it is true, they ask more wages than an immigrant, who is landed here with only enough money left to get to his destination, and if our farmers here only had as much profit from their dairy herds as the wheat producers in the West have from their wheat, they also could afford to pay them those wages and then our own boys would be staying with us.

I have been an employer of labor for 18 years and I still have with me the first man I hired and every one in my employ to-day is a Blue Nose and most of them born and brought up in New Brunswick.

Now, Mr. Editor, I realize I am taking up a lot of valuable space, and I will merely say, in closing, in case anyone should think me a pessimist, that every dollar I own (and it is true that is not many) is invested in the Maritime Provinces, some of them in dairy stock and some in a butter factory. This is my home, and I doubt not, always will be, and, therefore, believing, as I do, that agriculture is truly our largest natural asset, I say, "let it be developed."

Let us hear from all, both for and against, because if the idea is right, it needs all your support, if the idea is wrong, point out its weak points.

Yours truly,
E. A. SCHOFIELD.

P. S.—I might add that I fully believe the Dominion Government might well assist our own local government in some such scheme as this bonus, because I have read in the estimate passed at Ottawa this year of $165,000 passed for experimental farms. How much does N. B. get of that ?

$100,000 passed for the development of dairy and fruit industry. Can we not come in for part ?

Growing and Using Corn For Ensilage.

(Continued from page 475.)

Supposing an average crop, say 16 tons, then one ton corn in the silo, ready to feed, would have cost $1.53.

SILOS.

Stave silos are entirely satisfactory. They should, however, be very carefully and staunchly built on a good cement foundation. The cost will run from $1 up to $3 per ton capacity.

Cement silos are very durable and quite satisfactory, if well built. They will cost from $2 to $5 per ton capacity. acity. Care must be taken to build of good material and to strongly reinforce with wires or bands.

The round shape is essential to best results. Where wood is used only one thickness of two inch staves, or one thickness inch dressed lumber in square or straight line walls should be used.

EQUIPMENT.

Cost of extra equipment necessary to start into corn cultivation and ensiloing on a large scale on a Canadian farm.

Double cultivator ....$	60.00
Single cultivator	6.00
Corn harvester	140.00
Corn blower or cut box.....	140.00
Silo—say about	300.00
Total .... $	646.00

Such equipment may be expected to last 10 or 15 years, say 13 years, or $60 a year. The whole cost is likely to be repaid in about three years. The silo might quite possibly last 20 years.

SUMMARY.

1. Corn will grow on any well drained and well manured soil.
2. Thorough soil preparation is absolutely necessary.
3. Corn should not be sown closer than 3 ft. apart in hills, or if in rows, 3½ ft. apart, 8 inches between plants in the rows.
4. Sow varieties suitable for district. Varieties that will mature fairly well are necessary.
5. Keep field well cultivated and free from weeds.
6. Cut in dough stage.
7. Preserve in silo if possible.
8. Mix chaff or cut straw with ensilage when feeding.

From a Bulletin by J. H. Grisdale, B. Agr., Agriculturist, Central Experimental Farm.

R. A. Lister & Co. Establish a Maritime Branch at St. John.

It will be interesting to many of our customers, agents and others interested in cream separators to know, that owing to the rapid growth of our business, we have found it necessary to move our Maritime branch office to the sea-port city of St. John and are now located in the Globe Building, on Prince William and Water Streets, within twenty yards of the docks. The building is a fine structure and affords us ample room for office and storage purposes. We shall be glad to have all communications addressed to R. A. Lister & Co., Ltd., 82 Water Street, St. John, N. B., where all enquiries will receive prompt attention.

We wish to thank our customers, agents and friends for past patronage and beg to state that we have this year added two new models of cream separators, our size, 2 B and E machines, each of which has a capacity of 720 lbs. per hour and both being easily turned by a boy or girl.

The management of the St. John branch hope to meet as many as possible of our friends at their offie during the Dominion Exhibition, which is to be held in St. John during September next and trust that the change will greatly facilitate business matters for all concerned, and that whilst making many new customers and friends, we may still have the continued support and patronage of our old ones.

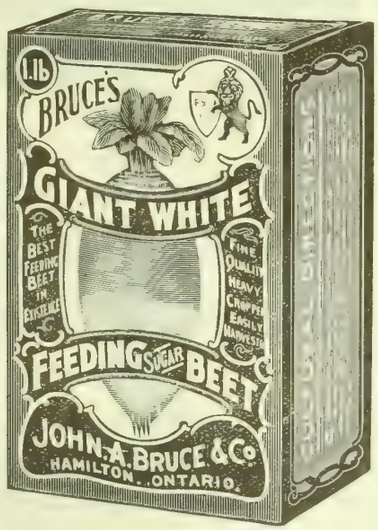
QUEBEC, - CANADA.

Bruce's Giant White Feeding Beet



Leaders of all tests at the Ontario Agricultural College, Guelph, since their introduction.

These grand Feeding Beets, introduced by us in 1900, combine the fine rich qualities of the sugar beet with the long keeping, large size and heavy cropping qualities of the mangel. The roots are clean and tops small, white flesh, solid, tender and very sweet, and on account of the bigger part of length growing out of the ground they are easily harvested. They will outyield all the other kinds of Sugar Beets and Mangels. The roots are the largest, handsomest, most uniform and cleanest of all Sugar Beets, and this, combined with their great richness and easy harvesting quality, makes them the "beau ideal" of a root for the farm. To show what a grand root we have and how it is capturing the trade, we give our sales—1900, 43 lbs.; 1902, 1954 lbs.; 1905, 4327 lbs.; 1907, 9800 lbs.; 1909, 21421 lbs. We offer in two colors, white and rose, each 1-4 lb., 12c; 1-2 lb., 18c; 1 lb.; 30c, postpaid.

FREE—Our illustrated 104-page Catalogue of Vegetables. Farm and Flower Seeds, Bulbs, Plants, Implements, Poultry Supplies, etc.—Send for it.

JOHN A. BRUCE & CO., LTD., Hamilton, Ont.
SEED MERCHANTS. ESTABLISHED 60 YEARS.

Foundation of Successful Dairying.

(Continued from page 480.)

A very important part of dairying is to make it profitable all the year around. In order to be successful you must imitate in winter what nature provides in summer, such as permitting plenty of sunlight to enter the stables, as sunlight destroys germs; warm quarters with plenty of fresh air, clean water with the chill taken from it, succulent feed, such as ensilage, clover or alfalfa hay, and a reasonable amount of other grains that any farmer can raise on his farm.

In selecting and buying cattle, select the most healthy looking animals and then determine positively with the tuberculin test as to whether or not they are free from tuberculosis. Select dairy cows that have every indication of milk producers but determine this positively by the use of the Babcock test and scale. Select a dairy breed of cattle whose product and offspring will bring the highest possible price in any market and you will surely be successful in dairying. – DR. DAVID ROBERTS.

The Horse Show in Kentville.

The fourth annual Horse Show, held under the auspices of the Kentville Board of Trade on Tuesday, April 26th, was a success in every particular, the appeals of the committee having been responded to very liberally by all upon whom its members called for financial assistance, while the clerk of the weather furnished an indeal day for both man and beast, and these, with an entire list of over 60 horses, with the throngs in attendance, easily place these by far the best of thoroughly enjoyable exhibitions.

Promptly at 10.30 a. m., the horses entered in the show, under the guidance of Barry Roscoe, Esq., who filled the arduous position of marshal in a very creditable manner, started from in front of the post office on their parade through the principal streets of the town, headed by Kentville Brass Band, whose well rendered selections were thoroughly enjoyed by the crowds thronging the streets, through which the procession passed.

At 2 p. m., Dr. Standish began the judging, and from that time till nearly six o'clock the many eager spectators awaited his decisions, and when the awards were announced the admirers of the winners greeted the fortunate ones by bursts of applause. Below we give the winners :

Class 1.—Standard Breds—4 enteries, 1st, Mabel G., L. E. Baxter, Canning; 2nd, J. R. Blanchard, Upper Dyke; 3rd, Lady Brookside, S. A. Bowser, Grand Pre.

Class 2.—Roadsters—12 entries, 1st, M. E. Parrish, Kingston Station; 2nd, Fred W. Clarke, Welsford; 3rd, A. L. Pelton, Berwick.

Class 3.—Carriage—8 entries, 1st, R. S. Starr, Starr's Point; 2nd, R. S. Eaton, Kentville; 3rd, John Redden, Kentville.

Class 4.—10 entries—General Purpose, single, 1st, E. O. Eagles, Kinsman's Corner; 2nd, A. L. Pelton, Berwick.

Pair General Purpose—3 entries, 1st, G. W. Trenholm, Grand Pre; 2nd, Wm. Tully, Kentville; 3rd, J. H. Pullen, Falmouth.

Class 5.—Draft—3 entries, 1st, Elmo Miner, Gaspereau; 2nd and 3rd, J. H. Lyne Evans, Church Street.

Class 6.—Saddle—10 entrie, 1st, Miss Francis Lydiard, Kentville; 2nd, R. S. Eaton, Kentville; 3rd, Miss DeWolfe, New Minas.

Dr. Standish, a veteran in the show ring, awarded the prizes to the best horses, giving his reasons to his audience.

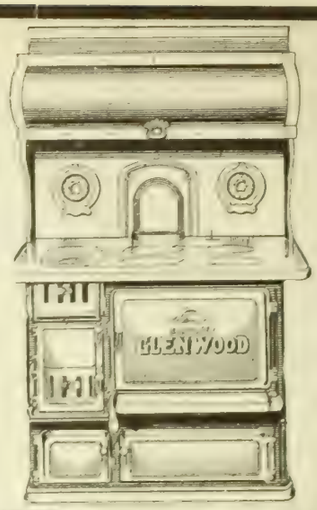
In the General Purpose class there appears to be a misunderstanding among the exhibitors as to the characteristics of this class; according to the rules laid down by the horsemen, and by which Dr. Standish abided. A general purpose animal is a good saddle horse, has the high knee action of a carriage horse, combined with the speed of the roadster, while the exhibitors of most in this class understand this horse as a good animal to work anywhere and a fairly good driver. These the Dr. classed in the agricultural class, and stated that the horses of the agricultural class, as shown, were worth much more to our farmers than the general purpose animal, as defined.

The meeting in Pastime Hall, in the evening, was fairly well attended by an audience, supplying in quality and interest, what they lacked in numbers.

President J. W. Ryan, while introducing the speaker of the evening, Dr. Standish, referred to the much better class of horses in the county at present than at the time he had organized the squadron of cavalry from which had originated the K. C. H.

Mayor H. H. Wickwire, in moving a vote of thanks to Dr. Standish, complimented the committee on the success of the show and expressed the wish that in the near future suitable quarters, accommodating the horses entered, a proper place for the judging and the establishment of a horse market, in connection with the show, would be additions of the not far distant future. Chairman J. R. Webster seconded the motion, which carried unanimously.

Don't Hold the Cents Too Close to the Eyes and You Will See the Dollars to Better Advantage.



In offering our Glenwood Ranges we are offering you something that has been tried and proven to give satisfaction. Ranges that have all the requirements that are of any advantage to a stove. We have removable nickel that fastens with a patent spring, removable grate devide centres that are interchangeable, ring cover, patent shaking grate, etc. We have sold in the month of April 51 Ranges in St. John, which goes to show what the people think of a home industry. We have one price for everybody. Send for booklet and prices. We prepay freight to your station.

FLORICULTURE.

All enquiries in this department will be answered by H. E. Gould, Florist, Sussex, N. B.

INQUIRER:—I have a lot of pansy seeds. Please tell me what kind of soil on which to plant them. Should they have the shade?

ANS.—The soil wants to be heavily fertilized with phosphate or cow manure, for pansies attains mammoth size only in rich soil. Make a circular bed for pansies for the reason that they show to better advantage in such bed It is well to have no other flowers growing in the same bed with your pansies. I have seen pansies growing about a central plant as a Geranium or rose bush and the effect is not good, neither plant shows to its best advantage. Pansy plants will grow large and a dozen will fill a good size bed if the soil is rich.

"As soon as my pansies begin to bloom freely, I pick the bloom each day," says a pansy lover, the pansies, like the sweet pea, nasturtium and violet, thrives best when blooms are plucked regularly outhewise the plants soon exhibits undersized flowers with short stems, or in common parlance, goes to seed."

After the pansy bed is made and the young plants are set out they must be kept damp. If there is not sufficient rain and there are indications of a drouth, they must be watered artificially. The plants soon become dry and turn yellow with the heat. The pansy grows especially well in either sunshine or shade. It is of advantage to know plants that thrive well in shady places for every yard has such spots. I have planted pansies about trees with good effect I do not place the plants too near the trunk of the tree but plant them a distance of about a foot and a half away. I once made a mistake of planting pansies too near the base of a lilac tree and the new shoots of the lilac springing up rapidly chocked my pansy plants, which had to be transplanted.

Great care must be taken with pansy plants throughout the season. I generally renew the phosphate once during the season, if the plants begin to send out smaller blossoms. Besides keeping the beds moist, they must be hoed frequently. This is done not so much for the purpose of keeping the beds free from weeds as to loosen the soil about the roots of the plants. The soil about my pansy plants is clayey and becomes so hard that if I did not work over my pansies they would soon decline.

Your sample leaf is the Chinese Primrose, one of the oldest forms in cultivation. The great improvement in both the leaves and the flower is almost as wonderful as in the case of the Chrysanthemum. At first the flowers were small and lilac in color, but now one can purchase seeds for almost any shade desired, ranging from white to blue and there are also double and semidouble varieties.

New Marketing System for Eggs and Poultry.

In South Australia there are 21 'egg circles' with a membership of over 700, consisting principally of small farmers. The secretary of each centre receives, tests and grades the eggs, pays cash for them at the current market rate, and sends them to the government cool stores at Adelaide. The government does the marketing and at the end of each quarter any profits are divided among the supplies. Each secretary receives 1-2 d. (one cent) per dozen for the eggs he handles.

Under this system there is no middleman's profits Grading and testing is very strict and no egg under 2 oz. in weight is passed. It is now recommended by the state poultry expert that 15 centres be established in Victoria at an initial outlay of £1,5,00, which, under his scheme, will speedily be repaid. It is anticipated that if this course is followed out, the production of eggs and table poultry will so increase that, instead of the value being £1,750,000, as it is now in Victoria, it will in five years reach £5,000,000. Special attention will be given in providing pure stock of first class egg producers.

Remedy For Black Flies on Ducks.

In the Maritime Farmer of April 12, page 416, Mrs. W. R., York Co., N. B., asked for a remedy for black flies on ducks. After a few years' experience in duck raising, we found an easy way to rid the ducks of flies was to keep them in a cool, dark building for a few days at a time while the plague lasted. It seems that a brood of flies live three or four days and they will destroy many ducks in that time if allowed; but if the ducks are kept in a building day and night during that time the flies leave them and go on the windows. When this lot of flies is gone the ducks may be set at liberty for some length of time, until the coming of another brood of flies, when it will be necessary to shut them up again.

One point in duck raising that demands attention is keeping pens clean and dry. Dampness and unclean pens tends to start catarrh, which kills them very suddenly. Increasing vigilance is the price of ducks. How would it do to have them hatched in August?

A. B.

Sunbury Co., N. B.

Owing to the short time required, 10 to 12 weeks, for raising ducks for market purposes we would think August hatched ducks would do all right, but the prices realized at that season of the year might not be so renumerative as that received for ducks hatched and sold at an earlier season.

Do Not Kill Failing Animals.

The farmer, who butchers his own meat, should see to it that his animals are gaining in flesh at the time of killing. We have been told by butchers that even an old cow, if put on heavy feed for a while, will yield as good a quality of beef as a young animal that has been shrinking badly just before killing. With an animal failing in flesh, the muscle fibres are shrinking in volume and contain correspondingly less water. As a consequence the meat is tougher and drier. When an animal is gaining in flesh the opposite condition obtains, and a better quality of meat will be the result.

SAVES —MONEY— —TIME— —WORK—

AND REALLY COSTS NOTHING

You can easily afford this handsome, practical kitchen necessity. For our special offer (please send for details of it) lets you pay for it out of what it actually saves in lessened grocery bills. You should ask us about it at once.

Whole Table-Top one heavy sheet of

BRIGHT ALUMINUM

You cannot begin to know the CHATHAM by this picture, for the picture cannot show even one of its most pleasing and valuable features—the SOLID SHEET OF BRIGHTLY-POLISHED HEAVY ALUMINUM that forms the covering of the table-top and extension leaves. This ALUMINUM is extra-heavy weight, pure metal—LOOKS LIKE SILVER—LASTS LIKE STEEL—cannot rust—won't gather dust or dirt—easily cleaned—simply perfection! And this is the ONLY kitchen cabinet you can buy with an aluminum top--which ADDS FULLY FIVE DOLLARS TO ITS VALUE. Yet you pay NOTHING EXTRA for it!

YOU MUST SEE IT TO KNOW IT

You must see the Chatham Kitchen Cabinet to appreciate how handy, compact, sensible it is. Exterior of specially-selected black ash, hard as rock and beautifully polished. Panels of golden chestnut. Bakeboard, drawers and flour-bin of snow-white basswood.

With the CHATHAM everything you use in cooking is at your fingertips. You can get meals ready sitting down. Your flour-bin (metal lined—holds 75 pounds!) is right under your hand in easy reach. Sugar bin (opened or closed by a touch) is just in front of you. Six air-tight canisters (free with every Chatham Cabinet) stand in the shelf-rack. Big, dust-tight drawers hold spoons, egg-beater, funnels, strainers, etc. ample closets for kettles, pans and the like.

Everything in its place And you can tidy up as you go along when you have a CHATHAM. There is a **Easily moved to sweep under** place provided for all the things you now walk back and forth for, between pantry and table. The CHATHAM spares you all those countless steps. Cupboards for jams and tinned foods; three roomy drawers (besides the two large ones) for small packages. High top makes a fine shelf for dishes—enclosed on three sides, and a rod at the back as a plate rack. Fine French plate mirror in center door—fix your hair in a second if any one comes. The CHATHAM is mounted on ball bearing castors. You can readily move it when you are sweeping up. Yet it is most solidly built—nothing shaky or wobbly about it. Whole thing is dust-tight, mouse proof—a permanent, durable, satisfying kitchen help.

YOU SHOULD NOW INVESTIGATE

Yet, with all these conveniences—features found in nothing else—the cost of a CHATHAM is probably less than you imagine. You should write us for the address of our agent nearest you. He can name you a price that will surprise—and he will gladly show you the Cabinet and point out its merits. Allow us to send you illustrated, explanatory

FREE BOOK

JUST ADDRESS

We use one of my Cabinets in my own home; and the women-folk say frankly that they simply could not get on without it. It certainly does cut kitchen-work square in half. And I know we build it so well it can safely be GUARANTEED to you.

Bacteria.

In reply to a list of questions re bacteria, sent by Box 114, Mahone Bay, N. S., we would say :

There are various forms of bacteria in the soil that are especially beneficial to the farmer, as will be seen by a persual of the article by Prof. Cumming, in our first April issue, entitled "Bacteria in Relation to Rural Life."

We have forwarded a marked copy, containing said article, to the above address.

The bacteria referred to by the American Magazine are those that live and form nodules on the roots of clovers and other leguminous crops, such as vetches and peas.

Each one of the foregoing plants has its own particular variety of bacteria. The bacteria essential for the growth of alfalfa will not do for red clover and the various kinds of clover require their own particular bacteria.

The value of this particular class of bacteria is their value as nitrogen collectors. They collect the nitrogen from the air and store it in the nodules on the roots of the leguminous crops. Nitrogen is one of the most expensive constituents of fertilizers, hence the growing of leguminous crops is the cheapest way for supplying this valuable element to the soil for the use of other crops.

Potash and phosphoric acid, the other essentials for plant growth, must be supplied in some commercial form.

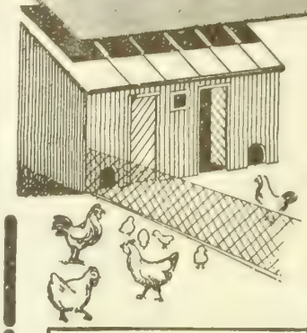
Bacteria, for the various leguminous crops, may be procured from the Agricultural College, Truro, N. B.

Prevent Sore Shoulders.

The following hints from Dr. Glover, of the Colorado Agricultural College, are timely. Too much care can not be executed in seeing that the collar is a perfect fit. A collar which is too large is more likely to injure the horse than one that is too small. The collar should be scraped each morning and carefully cleaned before it is again put on the horse. Before the spring work begins, it is well to oil the harness and have it soft and pliable. For the first few days of hard work on soft ground, the shoulders of the horse should be bathed in cold water every night, after the harness is removed. The horse will be very sore and tired for a few days and should be given every kind of attention Watch the harness to see that the draft is at right angles with the shoulders. If it is too low, the collar will be constantly kicking up at the top and the horse will soon have a sore neck. If the draft is too high, the collar will not rest securely on the lower part of the shoulder, where the horse is best prepared to throw his weight. If there are any calloused lumps on the horse's shoulders or back, they should be carefully removed before the busy season. If the collar is put on over one of the "sit fasts," it will have the same result as a man trying to walk with a button in his shoe or a bunion on his foot.

This article is not for the purpose of suggesting treatment for bruised shoulders and sore neck, but simply as a reminder that as spring approaches an ounce of prevention (by having the horse and the harness in good condition before beginning the spring work) is often worth pounds of cure later on when the horse is disabled and you are deprived of his services for weeks, right in the busy season.

PAROID ROOFING



David Harum knew the horse business, but even David himself could never have sold you a horse on his mere say-so. You'd want to see the horse—want positive evidence of his "good points" before you'd pass over a dollar. Good horse-sense too!

Why not use common-sense and caution when it comes to buying roofing? A roof costs money. It takes time and money to apply it whether it is good, bad or indifferent. And a bad or indifferent roof will cost you a lot of money in the long run. You want **wear** when you want roofing. Wear is told by **actual duration**—not fanciful claims and slyly-worded guarantees. That's exactly why you should insist on **Paroid Roofing.**

More than likely your dealer can show you a Paroid Roof, or tell you where you can see one. Send us your name and address and we'll tell you where you can see a Paroid Roof if your dealer can't show you one.

Paroid Roofing is one of the famous **Neponset Products.** The "Little Girl" Trade Mark is your protection—a guarantee of quality and durability. We will replace any Neponset Product or refund your money if it proves defective in manufacture. Look for the "Little Girl" Trade Mark.

OUR OFFER

When you see Paroid on your roof—if it is not satisfactory tell us and we will send you a cheque for the cost of the roofing and the cost of applying it. If any Bird Neponset Product ever proves defective in manufacture we will replace it. If a broader guarantee than this could be made we would make it.

BIRD NEPONSET PRODUCTS

N.B.—Write to our Building Council Department for free information concerning any building problem you may have to solve. Give full particulars and state exact dimensions. Write for samples of Neponset Products and we will give you name and address of your nearest dealer.

F. W. BIRD & SON, 501 Lottridge Street Established in U.S. 1795 **HAMILTON, ONT.**

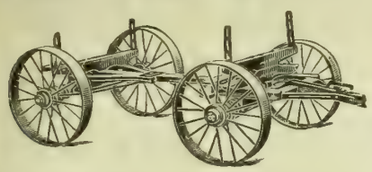
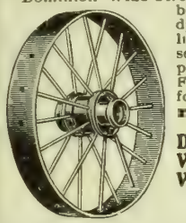
Buy This Wagon.



Dominion Wagons are strong, low loaded easier than high wagons. Changed to platform pattern instantly, easily. Halves labor. Saves time. Easy on horses. Easy on your pocket book. Built to **last**. Can't break. Can't rot Cuts repair bills.

Dominion Wide Tire Low Steel Wheels—best for stony or muddy roads. Cheaper, lighter than wood. No setting tires. Cold proof, Last a lifetime. Fit all axles. Write for free catalogue **now.**



Dominion Wrought Iron Wheel Co., Ltd.,

Orillia, Ont.

Shall We Sow Grain Thick or Thin?

One often sees the question raised in the agricultural press whether better results are obtained by sowing cereals thick or thin, and both methods find advocates who strongly recommend one or the other according to their personal experience. This divergence of opinion is natural because the problem depends on varying factors. It is impossible to lay down precise rules which are applicable to every case.

The character of the soil is undoubtedly the chief factor. If the soil is eminently suitable for the crop the seeds can be sown more sparingly than in cases where the soil is not so well adapted, and in this connection the natural fertility of the land and the nature of the previous crop have to be considered. Assuming a soil rich in plant food, it will produce stronger plants, requiring more space for their proper development. The growth of each single plant is freer and better, more room is allowed to the roots to find their supply of nourishment, and the more freely their leaves are exposed to the beneficent influences of sunshine and air. Therefore, in good soils a superfluous liberality of seed is so much waste, and indeed an injury to the crop.

On the othet hand, on poor soils and on soils not sufficiently prepared, lumpy, or subject to weeds, it is judicious to sow more freely. Similarly, if the ground is either very dry or wet in character, or subject to insect pests, seed should not be stinted.

Again, the quality of the seed is an important factor. Heavy, well-formed seed with good germinating power can be sown more sparingly than seed of an uncertain and inferior quality.

We should say also that the date of the sowing operation has an influence on the question. As a rule, early sowing needs less seed than a later sowing. In the firsye case the roots have more time to seek nourishment, and the plants may be expected to develop more strongly.

And finally the method of sowing must be taken into account. Seed broadcasted must be sown more thickly than seed entrusted to the ground by a drill. It is not possible to sow by the hand so evenly, nor is the seed deposited at a uniform depth. Some grains certainly remain on the surface and fail to germinate, so that the use of a sowing machine is a real economy.

A full and satisfactory crop does not by any means always follow a thick sowing. Consideration of all the circumstances must be given if the best results are to be obtained.

Halifax Prices.

GRAIN—Oats, 55c.

FEEDSTUFS.—Bran, $23.50 to $24.00; shorts, $27.00; middlings, $26.50 to $27.00; oil cakes, $2.15; gluten meal, $1.50 per bag; corn meal, $1.60.

DRESSED MEATS.—Beef (carcass), 9c to 10 1-2c; beef (retail), 15c to 25c; mutton, 8c; veal, 7c, lamb, 12 1-2c; pork, 11c.

HORSES.—Drafters, $250 00 to $350.-00; roadsters, $300.00; carriage, $175.-00 to $250.00.

DAIRY PRODUCTS.—Creamery prints, 32c; creamery solids, 31c to 32c, dairy prints, 26c to 29c; dairy butter; tubs, 25c to 26c; cheese, twins, 14c to 14½c; large 13c to 13½c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 19c; flowl, 11c; chickens, $1.25 to $1.50 pair; ducks, $1.25 to $1.75 pair; turkeys, 18c fresh goblers.

FRUIT —Apples, $2.00 to $1.00.

VEGETABLES.—Carrots, $1.15; potatoes, $1.10 to $1.25; turnips, $1.00; beets, $1.50.

MISCELLANEOUS.—Hay, $15 00 to $16.-00; straw, $10.00; wool, 21c to 22c; beef hides, 10c to 10½c; calf skins, 15c to 17c; sheep skins, 95c to $1.10; lamb skins, 10c to 15c.

MARKET REVIEW AND FORECAST.

BUTTER continues very scarce. It is practically impossible to get any good dairy, in either tubs or prints. In creamery the supply does not equal the demand, owing to the scarcity of dairy. Several lots of rolls have been brought in from Ontario this week, costing 28c landed here.

EGGS continue to come forward freely and are holding at the price quoted.

CHEESE.—Fooder cheese is now more freely offered and at lower prices.

STOCKS are light and will bring prices quoted.

St. John Prices.

MEATS.—Beef, 7c to 9c per lb.; mutton, 8c to 9c per lb.; pork, 10c to 11c per lb.; lamb, $2.50 to $4.00 each; veal, 5c to 7c per lb.

DAIRY PRODUCTS.—Butter, in tubs, 22c to 25c per lb.; butter, in rolls, 22c to 25c per lb.; butter, in prints, 24c to 26c per lb.

POULTRY AND POULTRY PRODUCTS —Eggs, 17c per dozen; fowl, $1.00 to $1.30 per pair.; turkey, 20c per lb.

VEGETABLES.—Potatoes, 90c to $2.00; turnips, 60c to 65c.

Butter and eggs are in good demand. The market is well supplied with veal.

Prince Edward Island Prices.

MONTAGUE dealers are paying 42c a bushel for oats, 22c to 25c a bushel for potatoes, 16c a doz. for eggs, 10½c a pound for pork, 22c a pound for butter and 8c to 9c a pound for hides.

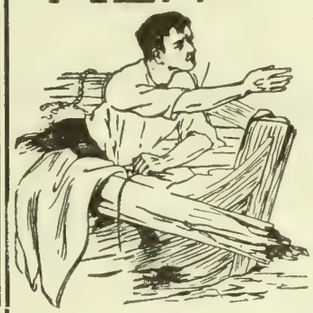
SOURIS MARKET PRICES :—Potatoes, per bushel, 28c; oats, per bushel, 42c; pork, per lb., 10½c; beef, per lb., 16c; butter, per lb , 27c; eggs, per dozen, 18c; hides, per lb., 3½c, and hay, per ton, $12 to $14.

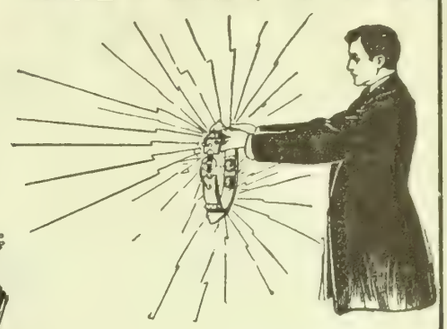
ALBERTON PRICES :—White and black oats, per bushel, 40c; butter, per lb., 17c; eggs, per doz., 16c; pork, per lb., 10c; hides, per lb., 8½c; loose hay, per ton, $10; pressed hay, per ton, $11, and beef, per qr., 7c to 8c.

IN CHARLOTTETOWN there is a general laxity in products in the city market. Quotations differ very little from those last reported. Fowl, ducks and chickens are quoted at 9c to 12c a pound, black and white oats at 40c to 46c a bushel and potatoes at 20c to 30c a bushel, in both the retail and dealers' prices.

Have any of our potato growers experimented with flowers of sulphur dusted over cut seed to prevent scab? Those who have tried it say the success has been nearly perfect. Their plan is to cut into a tight box and then sprinkle the sulphur in layers, and stir or shake until each piece is coated. Those who object to corrosive sublimate or formalin may find here a substitute. If any have tried sulphur let's have report of results through the Farmer.

"A LIFE SAVER FOR WEAK MEN"





Give me a man broken down from dissipation, hard work, or worry from any cause which has sapped his vitality. Let him follow my advice for three months, and I will make him vigorous in every respect as any man of his age.

I will not promise to make a Hercules of a man who was never intended by Nature to be strong and sturdy. Even that man I can make better than he is; but the man who has been strong and has lost his strength I can make as good as ever he was.

I can give back to any man what he has lost by abuse of the laws of Nature.

You Run No Risk in Using My Belt. I Take All Chances

Do you doubt it? If so, any man or woman who will give me reasonable security can have my Belt, with all the necessary attachments suitable for their case, and they can

PAY WHEN CURED

Dr. McLaughlin: Peterboro, Ont.

Dear Sir: I am very thankful to say that I feel much better, both in strength and health. My back is not like it was, for I can do a day's work now much easier than I could before using your Belt. I now wake up in the morning feeling fresh, not like before, when I had that languid feeling. I have more life in me now. I am well satisfied with the Belt. I only wish I had obtained it before. Yours Truly,

A. RICKARDS.

Every man should understand that physical power, large muscles and strength of endurance come from animal electricity. My treatment will pump every part of the body full of that and perfection will result.

It not only restores vigor and increases nerve power, but it cures rheumatism, pains in the back and kidneys, indigestion and constipation, and all troubles which result from weakness of any vital organs.

FREE BOOK—Cut out this coupon now and mail it. I'll send this book without delay, absolutely free. Call if you can.

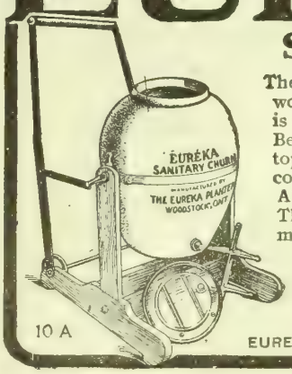
Write plainly.

While rejoicing at the remarkable interest in setting new orchards it will be well to bear in mind that the man who does not take care of his old trees will not properly care for the new, and that no young orchard can thrive when located near by or in connection with old neglected trees. If orcharding is to be made of any account the old trees must be cleaned up and the worthless stuff cut down and destroyed.

GIRL WANTED.—Good wages and steady work for a general girl. Apply to B. F. BLANCHET, Rothesay, N. B.

EUREKA

SANITARY CHURN



There's no comparison between the ordinary wooden churn and the "EUREKA". Barrel is stoneware—top is clear glass.

Besides being absolutely sanitary, the glass top enables you to see how the churning is coming along without opening the churn.

Also made with Aluminum top.

The "EUREKA" is the easiest churn on the market to operate. By tilting back the frame until the weight rests on the wheels, the churn can be quickly and easily moved—while the barrel remain upright.

If your dealer does not handle the "EUREKA," do not take a substitute but write us for catalogue.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

Barred P. Rocks.

Our claim to be the foremost breeders of this variety in Eastern Canada has been established by ten years of the keenest competition in the show ring with this class of birds. Our latest triumph at the Amherst Fair, winning, for the second time, the silver trophy for the best cock, hen, cockerel and pullet, of any variety, and the specials for the best shaped and the best colored bird of this kind, seals the fact. First cockerel, first pullet, first hen and second cock at Amherst means quality now. First cockerel, first hen, first pen and second cock at Halifax, all in one year, endorses it. Stock and eggs for sale. Satisfied patrons our aim

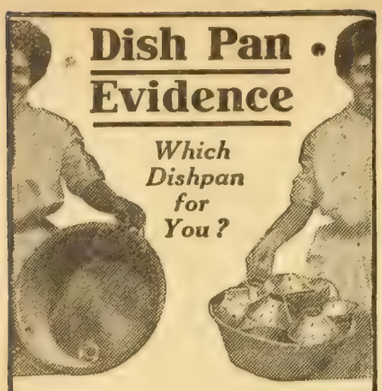
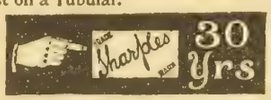
Dish Pan Evidence

Which Dishpan for You?



The practically empty pan contains the only piece used inside Sharples Dairy Tubular Cream Separator bowls. It is smooth, tiny, instantly removable. The full pan contains the disks from a single common cream separator — one of thousands of the common sort that are discarded for Tubulars every year.

The simple, sanitary Sharples Dairy Tubular is the only modern, easy-to-clean cream separator—has twice the skimming force — lasts a lifetime. The dishpans show one reason why every woman should insist on a Tubular.



The manufacture of Tubulars is one of Canada's leading industries. Sales easily exceed most, if not all, others combined. Tubulars probably replace more common separators every year than any one maker of such machines sells. Write for catalog No. 194

THE SHARPLES SEPARATOR CO.
Toronto, Ont., Winnipeg, Man.

P. E. I. Notes and Conditions.

Editor Maritime Farmer:—

After passing through one of the finest and most pleasant winters ever seen on the Island, we are now enjoying beautiful, spring weather fully two weeks earlier than usual. Our summer Steamers, which kept up communication with the outside world up to New Years, began their work again this spring the first day of April; and we were served fairly well with the two icebreakers, if indeed, they can be called such. other two months. After continuous appeals from the people of the west end of the Island to the powers at Ottawa to send one of the winters steamers to break through a bridge of ice at the mouth of Summerside harbor, thus enabling the summer steamer to ply at once, she, at last, was sent and after puffing and blowing and running through some of the thinner ice turned and steamed back to Charlottetown.

The summer steamer, "Empress," supposing the only barrier from Summerside to Point de Bute now broken, came up the Straits and cut her way into Summerside harbor, a fete which the new powerful Government icebreaker refused to do and ever since has made regular trips. It is quite evident that the Government would like to freeze up the western route all summer if possible.

The mild winter has been favorable for all kinds of stock and as a result, dairy cows are in great demand and at the auction sales are bringing good prices. Several of our co-operative creameries were kept running all winter and the prospect now is for an increased supply of milk during the coming summer. Those who have kept and fattened a good number of hogs the past winter have made good money. Pork at 11 cents per lb. and potatoes at 20c or less, and oats little better than 40c. should be well marketed in feeding them to hogs. Many farmers have had poor luck with their spring litters and young pigs are very scarce and high in price. The high price of the past season has induced farmers to keep more young pigs for this fall's feeding, but we hardly expect to see pork so high this fall.

Beef is also worth having this spring. 5½c to 6c live weight fed till June is the usual price to those who sold some months ago. Good horses are also in demand at high prices, so that the farmer can hardly make a mistake in feeding any kind of live stock for market. The poultry side line of farming is also receiving great attention just now. Eggs are worth more than double what they were ten years ago and we can get 14 cents a pound for dressed chicken as fast as we can get them fit to market. It is almost incredible to believe the great weight which some of the heavy breeds of spring chickens can be made to weigh in the fall. A chicken dressing eight pounds is not a rare thing now and some have even reached ten; if they keep on growing it loovs as though the duck and the old goose would have to step down and out, but still a good flock of geese in the fall are an ornament to any barnyard.

The farmers who got their potatoes off through the winter at 30c. per bus. have apparently struck it better than those who bought them at that price. Great quantities of potatoes are in the country everywhere and at the present they are not wanted at any price and the prospects are not at all encouraging; some think they may be wanted later on in June, but farmers who have hogs or cattle to feed them to have probably the best market they will have this spring. Oats have also dropped in price since the winter. First class recleaned seed oats are worth 45 to 48 cents, some who sold early got 50 cents.. Farmers were paid $1.50 to $1.60 by the merchants for good seed wheat and many are selling all out at this price and buying flour. We are now busy sowing our fields again. The new meadows look most promising and after such heavy warm rains we are almost sure of a full hay crop this summer. OBSERVER.

STOCK NOTES.

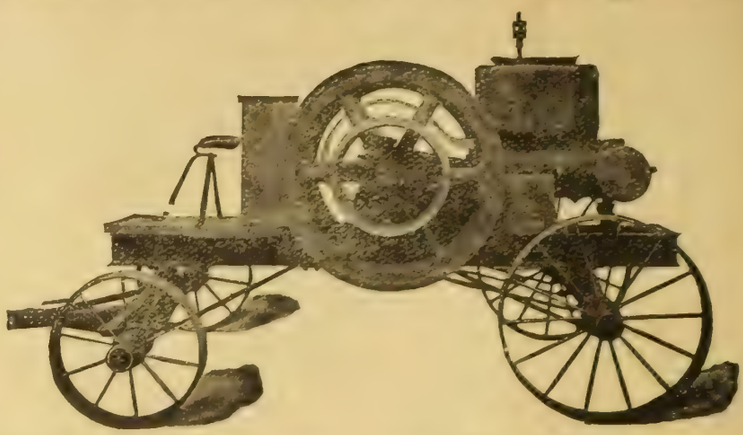
THE GILSON
"Goes Like Sixty."
Gas and Gasoline Engine.



All Sizes Stationary and Portable.
Has a World Wide Reputation as THE STANDARD ENGINE.

THE GILSON ENGINE is the highest development of gas engine construction. It is the result of tireless INVENTIVE INGENUITY, RIPE EXPERIENCE, and a fixed purpose to produce the BEST THAT IS MADE.

THE GILSON ENGINE incorporates the best features of all foreign and domestic engines, and besides possesses distinguishing features not found in others

THE GILSON ENGINE is noted for Reliability, Power and Durability. It will last indefinitely with ordinary care and be a constant source of satisfaction.

THE GILSON ENGINE is most ATTRACTIVE in APPEARANCE, EASY to OPERATE and VERY ECONOMICAL

Our reputation for producing the highest grade engines, for fair dealing and liberal, courteous treatment and Low Prices, is one of our most valued assets.

Ask for our large Catalogue; get our prices; compare Engines and Prices and you will decide in favor of the Gilson Engine, because it is the BEST and CHEAPEST as well

Do not allow a dealer or agent to sell you another make that is "Just as Good" as a "GILSON." Insist on having a "GILSON" and you will never regret it. Your dealer or agent makes more money by selling you an inferior machine, but what he makes, you loose.

Remember we absolutely guarantee every engine we produce.

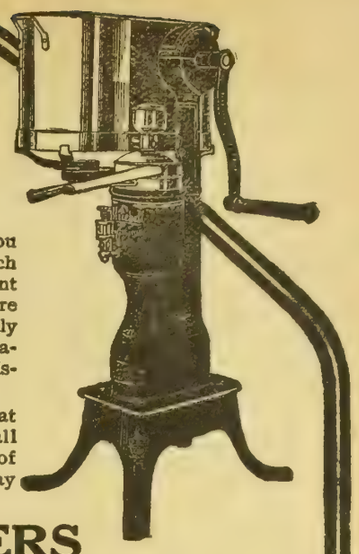
THE WAY TO GET FULL VALUE
From Every Pail of Milk With Least Labor



YOU are not making all the money you could make out of the cows you keep unless you use an I H C Cream Harvester. You know how much butter fat you lose if you skim the old-fashioned way—from 20 per cent to 40 per cent—not to mention the time and labor wasted. Such methods are out of the question for the farmer with the 1910 spirit of progress. It is equally poor business to use a cheap, out-of-date or makeshift separator. Such machines are hard to clean, hard to turn, last but a short time, never give satisfaction, are never worth the price.

The money-making dairyman is the man who invests in a separator that will skim to a trace; that is simple enough to be kept perfectly sweet at all times, so he gets quality cream; one that turns easily—so that any member of the family may skim without effort; one that will do the work day in and day out, year after year. For such a separator choose one of the

I H C CREAM HARVESTERS

Be sure to investigate these machines before you consider buying any other make at any price. That is all we ask. You don't need to be an expert to see that the design and construction of an I H C is more simple and practical than any other. The only one with dust and milk-proof gearing; most perfect straining device insuring pure cream and skim milk; frame entirely protected from wear by bronze bushings at all points; has largest shafts, bushings and bearings; simplest, surest, most economical oiling arrangement; flexible top bearing prevents vibration and keeps bowl steadied, no matter if power is unevenly applied; many other features equally superior to all other separators.

I H C Cream Harvesters are made in two styles—the Bluebell, gear drive—the Dairymaid, chain drive. Four sizes in each style. No matter how few or how many cows you keep, we can meet your requirements. See the International local agent; or write International Harvester Company of America at nearest branch house for catalogue and full information.

INVENTIONS Thoroughly protected by patent in all countries. EGERTON R CASE, Registered U. S. Patent Attorney, TEMPLE BUILDING, TORONTO Booklet on patents and drawing sheet on request.

P. H. Nugent, of St. Martin's, N. B., recently sold a pair of bay standard bred horses, full brothers, to Rev. Father Richard, of Kings County, for $800.00. These horses are five and six years old respectively, and weigh in the aggregate 2,357 pounds. They were first prize winners at St. John, N. B., Exhibition, last year.

Argentine and Australia Compete for American Meat Market.—The high scale of prices now prevailing for meats in the American market has had the curious effect of causing Australia and Argentine to compete for the business of supplying some of the meats used in New York. One shipment of 500 cars of frozen mutton were recently received in New Yorv from Australia, and these proved so attractive that two additional orders were at once placed, one for 1,500 and the other for 2,000 carcasses. Five New York firms are now, according to The Breeders' Gazette, engaged in selling Australian mutton in that city. The mutton sells at 2c. per lb. less than the native article. Representatives of the Argentine frozen meat industry have also been in New York, and have succeeded in placing a number of trial orders for meat from that country.

The Demand for Ayrshires.—Those who predicted a future boom in Ayrshire milk stock must be agreeably surprised at the early fulfillment of their prophecies, as already the demand has set in, and, it is said, to such an extent as to have outrun supplies. American and Canadian buyers, through their local agents, have been very active during the last few weeks, and have visited most of the herds where deep-milking pedigreed Ayrshires were likely to be got. These buyers are all after the one kind, viz., animals of heavy milking strains, and naturally their attention has been almost confined to the herds where milk records are kept. They are much more particular in their selection now than in the past, and, we understand have not been able to secure as many as they wanted. Breeders now recognize the value of retaining sufficient of the right blood so as not to deplete their herds, consequently the number of animals which can be spared for export just at present is limited. We hear of some high prices having been offered and refused, and it looks as if the £100 Ayrshire was likely to be much more common in the future than in the past. We know of one breeder who refused to break £100 for a bull calf; but as this animal has a wonderful milk-record pedigree, together with show points, it is to be hoped that he may be kept in Scotland to help to further advance the Ayrshire breed. Now that breeders fully recognize the value of milk records, and are preparing to supply the demand from overseas for the right sorts, we may expect foreign and colonial visitors to buy more fully as they gain confidence that their purchases will give them the desired result in filling the pail, and that the small-teated, tight-vesseled Ayrshire is a type of the past. Without doubt, the Ayrshire cow is the best all-round dairy breed in the world, and is the most encouraging to the enthusiasts who have held this opinion to find other countries recognizing their value. Every care should now be taken to see that nothing but good animals are exported, so as not to repeat the errors of the past, and when once customers can rely on getting cows to uroduce 900 to 1200 gallons a year Ayrshire breeders may expect to come nearer the high prices now paid for Shorthorns.—Scottish Farmer.

Vigorous Manhood.

Two "Health Belt Men." One 50 Years Old, the Other 30. Can You Pick Out the Younger?

I can show you how to restore your youth and how to keep it. A "Health Belt Man" CANNOT grow old; he must be young forever. Years count for nothing in this life, so long as you have great vitality. Weakness, Nervousness, Unmanliness are conditions to be laughed at by the intelligent user of my great appliance, for it gives, in abundance, all that vim, vigor and nerve force which the weakened system craves—Worn every night and all night for two or three months, it sends a great, warm, glowing volume of electricity into your body through the nerve centres at small of back; from the first hour's use you experience a decided benefit; there is a great, mysterious force which gets right to work. No drugs to be taken; no conditions imposed except that dissipation must cease. Help nature that much; the Belt will do the rest. It takes the weakness and kink out of your back; it drives rheumatic pains away from all parts of your body, you will feel and look young and strong again; woman and man noticing your physical change will be more attracted toward you on account of your new vitality and life; in two months you can experience the full vigor of perfect manhood, or you need not pay.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all the risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

Let Me send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature," and deals with various ailments common to both men and women, such as rheumatism, kidney, liver, stomach, bladder, disorders, etc. The other "Strength," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this city, take the time to drop in at my office that you may see, examine and try the Belt. No charge for advice, either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for any one who needs new vigor.

CURED OF CONSTIPATON

Mr. Andrews praises Dr. Morse's Indian Root Pills.

Mr. George Andrews of Halifax, N.S., writes:

"For many years I have been troubled with chronic Constipation. This ailment never comes single-handed, and I have been a victim to the many illnesses that constipation brings in its train. Medicine after medicine I have taken in order to find relief, but one and all left me in the same hopeless condition. It seemed that nothing would expel from me the one ailment that caused so much trouble, yet at last I read about these Indian Root Pills.

That was indeed a lucky day for me, for I was so impressed with the statements made that I determined to give them a fair trial.

They have regulated my stomach and bowels. I am cured of constipation, and I claim they have no equal as a medicine."

For over half a century Dr. Morse's Indian Root Pills have been curing constipation and clogged, inactive kidneys, with all the ailments which result from them. They cleanse the whole system and purify the blood. Sold everywhere at 25c. a box. 2

BETTER PRICES FOR YOUR BUTTER

The richness of butter depends on the pedigree of your cows.

The quality of butter depends on the churning.

MEN'S FASHION HINT.

Summer homespuns are going to be much worn by both ladies and gentlemen this year—at least this is the view of one of the Hewson Woolen Mill travelers who had an order book well filled with Spring business the other day.

R. S. Starr's Baron Majestic, the two year old pure-bred Clydesdale colt, son of Baron Primrose, which won first in his class at Amherst Horse Show recently, has been sold to P. L. Morse, of Berwick, N. S., for a handsome figure.

Chilled Meats From Australia.—A second consignment of chilled beef from Australia arrived in England last month. The vessel was on the way 67 days and still the meat was landed in perfect condition. It is believed this marks the beginning of a trade which may soon rival in importance the chilled meat industry of Argentine.

Live Stock Prices in Michigan.—A correspondent of Hord's Dairyman reports that at recent auction sales in Michigan a number of mares have gone up over $300, while a mare in foal fetched $335. Yearling colts are bringing $150. One Holstein cow sold as high as $95, and others $65 to $80, and a brood sow with seven young pigs sold at $60.

Donation to Breeding Bureau.—B. E. Chapman, of Chicago, has donated to the Canadian Breeding Bureau the ten-year-old stallion Robert G. Lansing, by Lamplighter—Lady Ballard, and the horse has been shipped to River Glade, New Brunswick, for the purpose of improving the breed of horses in that particular locality. He was a fast horse that went wrong in his ankles and tendons as a two-year-old after he had run a few good races at Louisville, St. Louis and other western tracks. He was a handsome inhividual, with a rich brown coat, stood sixteen hands two inches high and weighed 1,133 pounds when in training.

Elm Shade Berkshires.—J. R. Semple, writes:—The Elm Shade Berkshires have wintered in splendid condition and are giving good strong litters. A young sow purchased in Ontario last summer has just farrowed nine strong, evenly marked pigs, first litter.

Particular attention has been paid to the exercising of the brood sows during the winter, turning them out in the barn yard and feeding roots and whole grain on the ground, in consequence the pigs arrive strong and active and ready to fight their own battles.

The demand for breeding stock is lively and a very encouraging feature is that satisfied customers are repeating their orders and many new names are being added to the list.

The Prince Edward Island Live Stock Sale which was held at the Stock Farm, Charlottetown, on April 29th, was an unqualified success. Stock raisers and horsemen were present from all parts of the Island. Benjamin Carter, the Charlottetown city auctioneer, conducted the sale.

Among the sales were:—

One pure bred Clydesdale mare, sold to Major Allen, Covehead for $340.

One pure bred Clydesdale mare, to Leonard Wood, Mt. Albion, for $450.

Another to Amos Rodd, North Milton, for $210.

Clydesdale filly to Horace McKinnon for $115.

One span of drivers sold for $350 to Hammond Kelly, Southport.

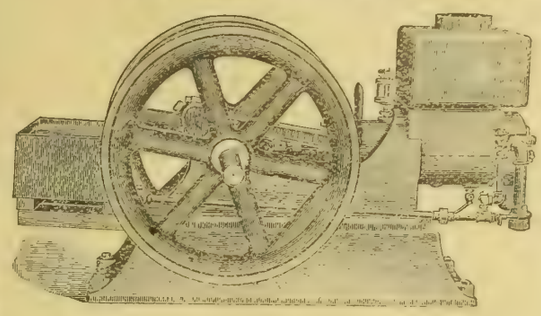
The farm horses sold at prices ranging from $145 to $180.

Pure bred Shorthorn cattle sold as follows: To Picton C. Brown, one for $80; another to John Andrews, East Royalty, $57; one to Bertram Younker, $81; one to George Wheatley, $73. A large number of young cattle sold at good average prices.

WE WANT AGENTS RIGHT AWAY!

In every section in the Maritime Provinces where a gasoline Stationary engine can be sold. The one we have to offer, which appeals most to farmers, is the

"Waterloo Boy"



Frost Proof Stationery Engine.

These Waterloo Engines are well and substantially constructed of the best material, by skilled mechanics, and are so durable that the makers have no hesitancy in extending to users their five years' guarantee. Engines are built on the interchangeable plan, all parts being made from jigs and templates, each and every part of the same kind being perfect duplicates, so in future years repairs that may be required can readily be placed without delay.

All the working parts are exposed to view and the duty of each part is readily understood by the user of the engine. The construction of these engines is such that they combine great strength and durability, yet it has been the manufacturers constant study to do away with all extra parts and simplify the construction as much as possible.

If you are looking for a good, reliable and up-to-date gasoline engine to handle—one which sells itself and leaves you a fair margin—write to-day for particulars.

H. J. P. GOOD, Mgr. H. A. PORTER, Sec't'y.

A. E. McLean, of Lot 16, P. E. I., has secured the famous Holstein bull, Artis John, from M. J. Leard, Kelvin. This splendid animal was imported last year and has never been beaten in a show ring. He weighs 2100 lbs. and was the grand champion of the Island last fall at the Provincial Exhibition, Charlottetown. He comes from the greatest milk producing family of Holsteins in Canada—and is the highest priced bull in the provinces today. Mr. McLean and the farmers in his neighborhood are to be congratulated on having secured this splendid animal.—Pioneer.

The PUBLISHER'S DESK.

Bigger Dairy Profits.—Knowing that our readers are always eager to learn how they may increase their milk profits these columns are always open to give them the best possible advice. We have just received a large Catalogue from W. A. Drummond & Co., of 185 King St. East, Toronto, which is full of suggestions for dairy farmers, large and small. The firm in question is one of the largest manufacturers of dairy supplies in Canada and judging from their catalogue we should say that quality and low prices characterize all the goods they sell. To mention only a few of their popular lines, Bterilac Milk Pail, Purity Cooler, Babcock Milk Tester, Automatic Scales, Milk Cans, Milk Bottles and that wonderful machine, The Root Sanitary Cooler—these are only a few of hundreds of useful and convenient articles listed in the large catalogue and we have no hesitation in stating that the majority of this firm's goods will make money for any man who owns one cow or more. In view of the increasing price of feed and the vigilence which is being exercised by the Dominion and Municipal authorities with reference to the absolute purity and sweetness of all milk supplies, our readers should certainly instal some of these profit-making implements. W. A. Drummond & Co. state that they will send a catalogue to any of our readers free, and we certainly advise everyone to take advantage of this offer, mentioning at the same time any particular thing they are in need of.

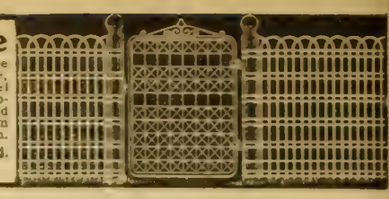
A Pioneer in the Roofing Business.—One of the pioneers in the prepared roofing business is the Brantford Roofing Company, Limited, and to this company must be given a large share of the credit for the success of the prepared roofing industry in Canada. The high quality of this company's products—the great satisfaction they have given—has created a feeling of public confidence in the merits of prepared roofing, and has won an enormous trade for Brantford Roofing in particular. The Brantford Roofing Company devote their entire energies to the manufacture of Asphalt Roofings exclusively, and as they have had many years experience in the roofing business, this speaks volumes for their belief in the superiority of Asphalt as a roofing material. This company state that the asphalt they use is an exceptionally high-grade of asphalt, which has been refined until it has become 99 per cent. pure. They also have their long-fibred pure wool felt made according to their own rigid specifications, as they say the ordinary commercial felt is not nearly good enough for the purpose. In addition to a thorough asphalt saturation the felt is given a heavy coating of asphalt into which is firmly embedded crushed feldspar asbestos fibre, mica and other materials noted for their fire-proofing and water-proofing qualities. At their immense factory at Brantford, Canada, the Brantford Roofing Company make nine different styles of asphalt roofing, and two thicknesses of saturated felt for sheathing or exterior surfacing. This line of surfaced goods can be used in any climate, and on pitch or flat roofs, or on the sides of buildings, and has been very successful in resisting the action of weather, acids and gaseous vapors, as well as a complete protection against flying firebrands and burning cinders. Like other progressive manufacturers, the Brantford Roofing Company are liberal advertisers, and their advertisements, many of which appear in this publication, are always interesting and instructive.

How to Select a Harvesting Machine.—This is a subject which should be of great interest at this time of the year. The long winter months are past. The season of activity is upon us. From now on until harvest time you will be busier every day. Now is the time to look over your equipment, find out what you will need, and then select the machine that in your judgment will be best adapted for your work. It is a subject that calls for careful consideration. If you do not choose wisely—you may find that instead of being prepared to make every moment cient, economical machine you have purchased "continual trouble." Every delay due to a breakdown, every moment lost by a bungling count at harvest time with an effimachine at harvest time means a reduction of your profits. It is the purpose of this article to call attention to a few points that you should consider carefully before buying any machine. In the fist place—you should consider carefully the reputation of the manufacturer and the record of the machine in the McCormick machines of the I. H. C. field. For example—the Deering and line are known quantities. The I. H. C. trade mark in the first place is a guarantee of quality—a seal of excellence. I. H. C. machines are known the world over for their efficiency. Deering and McCormick harvesting machines have proved their labor-saving, profit-producing qualities to millions of farmers in all parts of the world. They have a particularly good record for service on Canadian farms. They seem to meet the Canadian farmers requirements as no other machines do. They get all the grain no matter whether it is tangled, standing or down—in the quickest possible time. They have a strength and a wide ground. The Deering line comprises range of adjustment that adapts them to all conditions of grain and harvesting machines, binder twine, mowers, tedders, hay rakes and side delivery rakes, hay loaders, disk, shoe and hoe drills, cultivators, seeders, smoothing, spring tooth and disk harrows, land rollers, scufflers, Deering agents also handle gasoline engines, cream separators hay presses, wagons, sleighs and manure spreaders. The McCormick line is equally complete. This is another important point. For the wide variety gives you a sure opportunity of getting the machine best adapted for your individual use. The big demand for these machines permits their manufacture in such large quantities that the manufacturing cost is reduced to the lowest possible point—without sacrificing quality. In buying a machine bearing the I. H. C. trade mark, you are sure of getting a machine having the latest practical improvements. Every year finds the experts responsible for the design of Deering and McCormick harvesting machines in the field making notes and watching to see where any improvement could be made to increase their efficiency. Another question that should engage your attention now is the selection of binder twine. In choosing twine bearing the I. H. C. trade mark in sisal, standard Manilla, or pure Manilla brands, you are certain of satisfaction. The International Harvester Company has more at stake than selling twine. It is vitally interested in the successful operation of over a million binders and knows that no binder can work successfully with poor twine, and has therefore given the subject the most careful consideration. If you have not as yet made a selection—do not delay any longer. See the local I. H. C. dealer, or write direct to the nearest branch house of the International Harvester Company of America, at Brandon, Calgary, Edmonton, Hamilton, London, Montreal, Ottawa, Regina, Saskatoon, St. John, Winnipeg, Yorkton.

Peerless Lawn Fence

Is Strong and Attractive. All the wires are uniformly crimped, large gauge, steel spring wire, heavily galvanized and coated with white enamel paint. Never sags, never rusts. Improve your property with a Peerless Fence. Cheap as wood and more handsome and durable. Also full line of farm and poultry fence and gates. Write for information.

THE BANWELL HOXIE WIRE FENCE CO., Ltd.
Dept. K, Hamilton, Ont., Winnipeg, Man.



"Pedigreed" Cream Separators.—There is no questioning the value of a good cream separator. And there is no doubt but that a poor cream separator is just as poor economy as having none at all. In buying your separator, it pays to use the same business judgment you practice in buying live stock. In other words—buy a "pedigreed" cream separator—one with a record back of it—one made by a reliable manufacturer. You know that a "scrub" cow eats just as much feed and requires just as much care as a pedigreed cow. Yet the scrub cow doesn't pay half as much profit. It's the same way with cream separators. A "scrub" cream separator doesn't pay half as much profit—requires more attention than a "pedigreed" separator. So it pays to be careful in the buying. It pays to look who is behind the separator you buy. For that is your only real guide to making the right choice The further importance of choosing the right cream separator, is emphasized by the fact that the advantages of careful breeding and feeding may be spoiled by a poor separator. So, in reality, a cream separator is even more important than feed or breed. It isn't enough to get the biggest possible milk production. You must also be sure of getting the limit of butter-fat. Your separator must, first of all, skim to a trace. Second, it must be easy to clean. Third, it must be easy to turn, and fourth, it must be simple and strong in construction. Most separators claim all of these advantages. So we advise you to look to the manufacturer. Investigate thoroughly before you decide. In your investigations you will come across the I. H. C. line of Cream Harvesters backed by the International Harvester Company's reputation for quality and their immense buying, manufacturing and selling power. The I. H. C. line of Cream Harvesters merits your close investigation, for they possess many real advantages, besides remarkably close skimming, very easy cleaning, light running and simplicity and strength in construction. You will find that they are the only cream separators with dust-proof and milk-proof bearings. You will find in them a straining device that is perfection in itself—insuring quality cream and quality skim-milk always. You will note that the frame of an I. H. C. is entirely protected from wear, by bronze bushings and that the I. H. C. has the largest shafts, bushings and bearings, that they have the most positive oiling systems and that the flexible top bearing prevents vibration and keeps the bowl steady, no matter how unevenly the power is applied. And you can choose the size and style to just meet your needs, out of this excellent line. They are made in two styles—the Bluebell, gear drive—the Dairymaid, chain drive—and four sizes in each style. We suggest that you call on your local International dealer and get all the information you want, on just the cream harvester you need. If you prefer, write direct to the International Harvester Company of America, Chicago, U. S. A., for catalogs and any special information you wish.

A Fasinating Drama.—The peopling of the great Canadian West is a fascinating drama, whether we view it from the large or the small end of the telescope, i. e., from the point of the great railroad builder throwing a steel spine across the continent, or from the point of one little family unit finding its tree farm under the aegis of this transportation line. The line of the Grand Trunk Pacific across Canada is essentially the belt of homes. Who is it that answers the call of the wheat? The young, the brave, the hopeful, the helpful, says Miss Agnes Dean, in the March issue of the "Magazine of Commerce." The writing tools to write the drama are the strong arms of men and of faith possessed women. It is a good play for the world to watch. The first scene is enacted on the prairie farm where the virgin sod is turned under to a crop of wheat for the first time since creation's dawn. The second scene is the grain elevator, against the setting sun, and the waiting wheat train of Grand Trunk Cars. Our drama closes with the loaf of bread clutched in the eager grasp of the little child in some crowded city of the old world.—"Manchester (Eng.) City wews", March 19, 1910.

Greater Prince Rupert.—Mail advices to the Traffic Department of the Grand Trunk Pacific this week, show that there is great activity, both in new building operations and in the advance in real estate in Prince Rupert, which in another two months will complete its first year of existence. It is nothing unusual for a million feet of lumber to be delivered at Prince Rupert in a single week and it melts away as fast as men and teams can handle it. A number of lease-holders are starting to build wharves, and the new concrete wharf of the British Columbia Government will also be under way at once. The Grand Trunk Pacific is planning further large additions to its already extensive wharves. The British Columbia legislature late in the season, which has just closed, gave Prince Rupert a charter as a town, with special privileges and rights as to the control of municipal water and lighting privileges not enjoyed by other cities in British Columbia. The population of Prince Rupert believe that the inauguration of their own municipal government instead of being administered by commissioners, will mean a further stimulus to the already phenomenal, if not magical growth of the town.

THE MARITIME FARMER
AND
CO-OPERATIVE DAIRYMAN.

Directions For Making Spray Mixtures.

By Department of Horticulture.

SPRAY mixtures for the control of insects and fungi attacking plants may be divided into three principal classes: insecticides, fungicides and combined insecticides and fungicides. Insecticides are those sprays which are employed to control insects only; just as fungicides are for the control of fungous attacks. The two sprays are frequently combined in the same mixture to combat both insects and fungi.

INSECTICIDES. — Insecticides are grouped into two classes, according to the method employed in combating the insect. First, for those insects which chew their food and can be killed by a poison which is taken into the stomach, a poison such as arsenate of lead or Paris green, is used. Second, for those insects which suck their food from the plant a spray is used which will corrode their bodies or close the breathing pores. These are known as contact sprays.

INSECTICIDES FOR CHEWING INSECTS.—Among the principal chewing insects with which the horticulturist has to deal are the following: codling moth, canker worm, curculio, leaf skeletonizer, tent caterpillar, fall web worm, grasshopper, Colorado potato beetle; and for these insects arsenate of lead or Paris green may be used. While hellebore is preferable for the following insects when the fruits are nearly ripe; currant-worms, cabbage worms, caterpillars, and other insects attacking vegetables and small fruits. The use of arsenate of lead early in the season is recommended for all these insects, and white hellebore is used just before the ripening of the fruit.

ARSENATE OF LEAD.

Commercial—2	pounds arsenate of lead
50	gallons of water
	or
Homemade—10	ounces arsenate of soda
24	ounces acetate of lead
50	gallons of water

The commercial arsenate of lead is prepared for spraying simply by mixing it with water to make a smooth paste and adding this to the wayer in the spray tank, thoroughly agitating the mixture when adding the paste. The use of a barrel churn or a large sized egg beater in a round-bottomed kettle will assist in the rapid preparation of the paste.

Arsenate of lead may be made at home at a slightly less cost. For 50 gallons of diluted spray take 10 ounces arsenate of soda and dissolve this in a gallon of water (preferably hot) and in another gallon of water dissolve the acetate of lead. When completely dissolved pour the two simultaneously into the mixing tub containing the rest of the 50 gallons of water; stir well and the spray is ready. The use of wooden vessels is advised in handling these solutions.

If desired the chemicals can be dissolved separately and kept as stock solutions, and the arsenate of lead prepared as needed. For example, 31 pounds 4 ounces arsenate of soda dissolved in 50 gallons of water by suspending it at the top of the barrel in a coarse sack, and 75 pounds acetate of lead similarly dissolved in 50 gallons of water and thoroughly mixed, will give solutions containing sufficient material so that one gallon of each added to 48 gallons of water will give the strength mentioned in the formula. The main difficulty with the homemade arsenate of lead is that the chemicals used are apt to be of varying strength. The arsenate of soda is often adulterated with salt. In purchasing supplies of these materials it is well to get a statement of the quantities required to secure complete combination.

Two pounds of the commercial arsenate of lead or the homemade (when prepared according to the above formula) will prove effective for the usual sprayings, but when results are desired at once or the attack of the insects is very severe three or more pounds can be used. For stone fruits in addition to the two pound strength the use of 2 or 3 pounds of well slaked lime is advised.

Arsenate of lead is preferable to Paris green as an arsenical spray for it generally contains less free arsenic, injures the fruit and foliage less, is practically insoluble in water and therefore may be used at almost excessive strengths without serious injury to most foliage. It is very adhesive and is not as readily washed from the trees as Paris green. Properly prepared arsenate of lead, owing to its fine particles, remains in suspension longer and is capable of moreuniform distribution. Paris green is the stronger poison and while the same amount of poison will cost more in arsenate of lead the latter is desirable in orchard work.

PARIS GREEN.

4	ounces Paris green
1	pound lump lime
50	gallons water

Slake the lime carefully in a small quantity of water. When completely slaked add sufficient water to make a milky paste. Pour this through a fine strainer into the spray barrel or tank containing water sufficient to make fifty gallons. Mix the four ounces of Paris green with a small quantity of water and pour into the lime and water mixture through a strainer. The Paris green may be more readily and thoroughly mixed with the water if the two be placed in a bottle or jar and violently shaken for a few seconds before being added to the liquid in the spray tank. Thorough and constant agitation of the mixture during its application is necessary, as Paris green settles to the bottom of the tank in a few minutes if the preparation is left standing.

WHITE HELLEBORE.

1	pound white hellebore
50	gallons water
	or
1	ounce white hellebore
3	gallons water

Mix the hellebore with a small quantity of water and pour into the spray tank containing the required amount of water.

White hellebore may also be applied as a dust spray by mixing with 5 to 10 parts of flour or road dust, and with this, dust the plants when the dew is on, either early in the morning or late in the evening. White hellebore loses its strength very rapidly when exposed to the air, and should be kept in air tight receptacles. Material carried over from one year to the next is liable to be of little value.

INSECTICIDES FOR SUCKING INSECTS.—For those insects which obtain their food by sucking the plant juices the poisons used for chewing insects are of little value. Insects of this class require a spray which will corrode their bodies or stop their breathing pores. The efficiency of these sprays depends very largely upon the thoroughness of application, for the insect to be killed must be covered with the spray material.

This class of sprays is intended for such insects as plant lice, and other soft bodied sucking insects; among these are green apple aphis, wooly aphis, pear tree psylla, cherry aphis, such young scale insects as the oyster-shell, bark-louse, San Jose scale, scurfy scale and mealy bug.

LIME AND SULPHUR.

Homemade—15	pounds lump lime
15	pounds flour or flours of sulfur
50	gallons water

Commercial—There are many commercial preparations of lime and sulfur on the market and as the composition varies with the manufacturer it is impossible to recommend any particular dilution but in all cases the directions on the packages should be followed.

The method of preparation of the homemade lime and sulfur wash is taken from a circular on "Practical Treatment for the San Jose Scale", prepared by Dr. S. A. Forbes, State Entomologist. "Materials, 15 pounds of lime, 15 pounds sulfur and 50 gallons fairly soft water. For 50 gallons of the spray, heat 12 gallons of water in a 40 gallon iron kettle, mixing in the meantime, in a separate vessel, 15 pounds of sulfur with enough water to form a thin paste. Add this sulfur to the water in the kettle and bring the mixture to a temperature just below boiling. Then add 15 pounds of best lump lime, keeping cold water at hand to use as the ixture threatens to boil over. After the lime is fully slaked, boil for 40 minutes, with almost constant stirring. Then strain into a 50 gallon spray tank and fill with water, which had better be warm, although cold water will do. To prepare 100 gallons of the spray at a time, heat 20 gallons of water in the 40 gallon kettle, add 30 pounds of sulfur—previously reduced to a thin paste with water—and to this put 30 pounds of lime. Boil as before, and dilute to 100 gallons. Steam will be found more convenient to cook with than direct heat.

"Solutions of lime and sulfur which may be purchased ready for use after dilution may be substituted for the homemade preparation described above.

"*****Persons preparing or applying the spray should avoid getting it upon the bare hands or face as it is very caustic. The undiluted mixture should not be left in the kettle over night, as it is likely to harden and cake, and is then worthless. See that all barrels and apparatus are thoroughly cleaned before using the mixture in them, otherwise the nozzles are likely to clog. Thoroughly clean kettles, hose, barrels, pumps, and all spraying apparatus when the work with the wash is over for the season.

"Use this wash on the trees after the leaves are off, preferably in the spring before the buds have commenced to open. Never use the wash on

trees in leaf. Thoroughly coast the trees, being careful to cover the smaller twigs and branches and to get the mixture in all the forks and crevices."

KEROSENE EMULSION.

½ pound (chipped) hard soap
or
1 pound whale-oil soap
2 gallons kerosene
1 gallon soft water

To be diluted with water according to strength desired.

The soap is cut into small pieces and dissolved in the soft water heated to boiling, then remove the water from the fire and add the kerosene to the hot mixture, churning it violently at the same time. Pumping the mixture back upon itself for 5 to 10 minutes through a hand force pump is an excellent method of mixing the emulsion. Continue the pumping until a creamy combination is obtained which shows no free oil on its surface. This is a concentrated solution and must not be used on plants until further diluted as directed below.

For application to apple and pear trees in foliage, for green apple aphis, wooly aphis, pear tree psylla, etc., dilute one gallon of the emulsion with nine gallons of water. For cherry, plum and peach trees, and plants with tender foliage dilute with twelve gallons of water. For house plants dilute with fifteen gallons of water.

WHALE-OIL SOAP.

1 pound whale-oil soap
8 gallons water

Whale-oil soap is purchased ready for use and the spray mixture is prepared by dissolving the soap in boiling water and diluting to the required strength. This spray at the above strength is excellent for plant lice or aphis. The disagreeable odor of whale-oil soap makes it unsuitable for use as a remedy for pests on house plants.

FUNGICIDES.

A fungicide is a spray material which has for its active agent a chemical in which the spores of fungi aid in uniform distribution of the cannot develop, and a mediu to chemical. An example of a fungicide is to be had in Bordeaux mixture in which copper is the active agent, with lime to neutralize the effect and make it adhere to the foliage, and water to distribute it over the tree. Fungicides are designed to prevent or control such fungi as apple scab, bitter rot, black rot, mildew of the grape and gooseberry, tomato and strawberry rusts and other fungi of a similar nature. Injury to the foli age of plants following the application of Bordeaux mixture and other sprays is of common occurrence. Much of the injury reported or observed is preventable. The principal sources of injury as determined by observation are:

1. Use of improper or impure materials.
2. Carelessness in making the mixtures.
3. Improper and ineffective application.

The first two of these sources of difficulty can be entirely eliminated and the third greatly mitigated by reasonable attention and supervision. Formulas must be respected and small details of practice must receive attention in order to attain best results.

BORDEAUX MIXTURE.

4 pounds copper sulfate
4 pounds lump lime.
50 gallons water

To make small quantities of Bordeaux mixture for use in the home orchard, the equipment should be two tubs holding about 30 gallons each and a small slaking box. For the tubs oil barrels, cut in halves, are sufficient. Dissolve the four pounds of copper sulfate in the water by suspending it in a coarse sack in the top of a tub containing 25 gallons of water. Slake the lime in the box, being careful that only sufficient water is used to get a fine quality of lime putty without burning the lime. Strain this through a fine 30 mesh sieve into the second tub and dilute to 25 gallons. Then after stirring both the lime and copper sulfate, pour the two simultaneously through a strainer into the spray tank, stirring thoroughly as the two are being run together.

When large quantities of Bordeaux mixture are to be made it is well to prepare stock solutions of the copper sulfate and lime before the spray season opens. These stock solutions are generally made up so that each gallon of the spray contains 1 pound of material, although a strength of two pounds to the gallon is used at times. The stock solution of copper sulfate is prepared by placing 50 pounds of the crystals in a coarse sack in the top of a barrel containing 50 gallons of water, and a stock solution of lime is prepared by taking 50 pounds of lump lime slaked to a putty, and diluted to 50 gallons. The lime putty is made by slaking 50 pounds of lump lime in a shallow lime box, using care that only sufficient water is added to slake the lime and not allow it to burn, and after the violent action is over to allow the putty to stand a short time before adding the rest of the 50 gallons of water. The success of the Bordeaux depends so much upon the lime used that the following extract from Bulletin No. 135 is of interest. "The two common faults observed in practice are: the addition of too little water, which results in the development of too much heat and the 'burning' of the lime. In this case there are many small lumps that do not completely slake and will be thrown out when the lime is strained into the tank. The second fault is the addition of too large an amount of water resulting in 'drowning' of the lime. This, likewise, results in incomplete slaking, and therefore, a reduction in the actual amount of lime added to the mixture. In some cases where the lime is neither perfectly fresh nor of great purity these losses may so reduce the amount that the copper is not all precipitated and serious injury follows. Lime, during the process of slaking, should have constant attention; water should be added in small amounts as needed to keep the action even and to insure that perfect slaking which can be obtained in no other way. It is best to slake a definite number of pounds and when thoroughly slaked transfer to a barrel containing such amount of water as, added to the quantity used in slaking, will give a milk containing a definite quantity of lime to the gallon. Having the stock solutions prepared, the next step is dilution preparatory to mixing.

"The diluting tubs should each have a capacity in excess of one hundred gallons. A palm-oil cask of 250 gallons capacity, cut in half, will supply two tubs that serve the purpose admirably. We will suppose that the standard 4-4-50 formula is to be used and that the mixture is to be made in lots of 200 gallons. In one diluting tub, place 16 gallons of the stock solution of copper sulfate, made up 1 pound to the gallon, then add 84 gallons of water. The first lot should be carefully easured and the height at which it stands in the tub marked, so that in filling for succeeding mixtures, it is only necessary to fill to the mark. Thoroughly agitate the milk of li e and, if it has been made up 1 pound to the gallon, transfer 16 gallons to the other tub and fill up with water in like amount as for the copper sulfate solution and an equal quantity of milk of lime. This is on the plan of full dilution before mixing, which has been shown by experience to possess advantages over other ways of mixing, such as adding concentrated solution of copper to fully diluted copper sulfate, or combining the two ingredients in concentrated form and then diluting. The resulting mixture made by full and equal dilution settles less rapidly, is less frequently injurious, and attains a maximum of adhesiveness. These points of difference have been determined by field and laboratory experiments with mixtures made in the different ways, and we have no hesitation in urging equal and full dilution before mixing as being the best plan to follow. In mixing, equal streams may be conducted directly into a strainer supported over the receiving tank, or the streams may meet in a short trough which terminates on the strainer. Before starting the streams, the milk of lime must be thoroughly stirred and this agitation should continue until the mixing is completed, in order to insure uniformity in the combination."

Bordeaux mixture attacks iron and for this reason it is best to use brass or copper measures, and strainers, wooden pails and a spray pump with brass parts, especially where they come in contact with the mixture. Fresh Bordeaux is advised, for any Bordeaux mixture which has stood over night or settled thoroughly may prove unsafe.

LIME AND SULFUR FOR USE ON FOLIAGE.

1 gallon commercial material (mentioned elsewhere)
30 gallons water

Measure the water for the spray into the spray tank and add the lime and sulfur, agitating thoroughly. This spray has proven of value for use against apple scab while the trees are in leaf.

SELF-BOILED LIME AND SULFUR

8 pounds flowers of sulfur
8 pounds lump lime
50 gallons cold water

Place the lime and sulfur together in a barrel and add just enough COLD water to slake the lime, stirring constantly to prevent burning. Keep a piece of carpet or old burlap sack over the top of the barrel to retain all the heat possble. Watch the mixture carefully and as soon as an orange colored liquid starts to gather on the surface add the rest of the water. Strain through a fine sieve to remove the particles of lime, but work all the sulfur through. This spray is proving very satisfactory as a summer spray on the peach against the brown rot and scab.

CAUTION.—Do not use hot water or allow the mixture to stand after the lime is slaked and before dilution. In this spray we do not want the soluble sulfids (orange colored) to form, for these will injure the foliage and fruit.

COMBINED INSECTICIDES AND FUNGICIDES.

It is found desirable at times to combat the insect pests and fungi at one application of the spray and for this a combination of the insecticide and fungicide is used. This results in a saving in the cost of labor and time spent in spraying. The combinations given below are used with success in Illinois.

BORDEAUX-ARSENATE OF LEAD.

2 pounds arsenate of lead
50 gallons Bordeaux mixture
or
10 ounces arsenate of soda
24 ounces acetate of lead
50 gallons Bordeaux mixture

Prepare the commercial arsenate of lead by working into a smooth paste and add it to the diluted milk of lime. Prepare the homemade arsenate of lead according to the directions given under arsenate of lead and mix with the milk of lime. Then bring the fully diluted copper sulfate solution and the milk of lime together in the manner described in making Bordeaux mixture. Where a stronger poison is desired the arsenate of lead can be increased to 3 or 4 pounds. A more uniform distribution of the arsenate of lead is secured throughout the spray when it is added to the milk of lime instead of placing it in the spray tank.

BORDEAUX-PARIS GREEN.

4 ounces Paris green
50 gallons Bordeaux mixture

Mix the Paris green into a thin paste and add to the milk of lime and proceed to mix the Bordeaux according to the directions elsewhere.

LIME-SULFUR AND ARSENATE OF LEAD.

2 pounds arsenate of lead
1¾ gallons commercial lime and sulfur
48 gallons water
or
2 pounds arsenate of lead
50 gallons self-boiled lime and sulfur

Have the arsenate of lead in the form of a smooth paste and add to the lime and sulfur solution at the same time stirring the spray thoroughly. If a power sprayer is used it is advisable to keep the agitator working.

SPRAY PUMPS AND EQUIPMENT.

For the proper application of spray materials it is necessary that we have a well arranged place to prepare the spray. This will vary with the extent of the operations and the acerage to be sprayed, but should be ample. Small quantities of the spray can be prepared in large candy pails or small kegs, reducing the formulas in proportion to the amount of spray desired. The better the equipment the less troublesome and disagreeable will be the spray operations.

A good pump should be simple, compact, light, durable and have ample capacity to do the required work quickly and easily. A pump with few projecting parts, with brass valves and cylinder, and with an outside packed plunger, will prove the most satisfactory.

For use in the home garden, on the small bushes and trees, as well as in the greenhouse, there is no pump more suitable than some form of the Auto-sprayers or the bucket pumps. These pumps in brass can be obtained from any seedsman or florist for about $7.00 for the Auto-sprayer and for $3.50 or $4.50 for the bucket pump.

Where there are several large trees to be sprayed, the use of a larger pump will be desirable. The barrel pump will serve, where the acerage to be sprayed is three or less. These pumps are made to be fitted either in the end or side of a barrel. Usually a good kerosene oil barrel is used, with the pump in the end, for the pump is more easily operated at this height.

When the acerage to be sprayed is less than ten or more than three, a tank pump is more suitable. This is a double acting pump with a plunger of 2½ to 3 inches in diameter and a large air chamber so that a steady pressure of about 100 pounds can be maintained. These pumps are designed to supply two lines of hose carrying 4 to 6 Vermorel nozzels. A pump of this character should be mounted upon a tank holding about 200 gallons.

The use of a power sprayer will depend a good deal upon the capital, amount and price of labor and the acerage to be sprayed. Where there are ten or more acres to be sprayed during the season some form of a power outfit will be useful. Power may be obtained from the traction

of the machine, compressed gas or air, gasoline or steam. The two most used are the traction and the gasoline machines.

Where small fruits, strawberries, grapes, and plants of that type, are to be sprayed the traction machine is satisfactory. These machines have a pump driven by a wheel and the pressure is mantained by means of storage tanks. Special fittings are provided for spraying rows of berries or potatoes. These attachments are provided for use with the hand outfits when desired.

The gasoline sprayer can be obtained from different manufacturers at prices ranging from $275 to $400 for the complete mounted outfits.

Besides the spray pump the outfit for spraying will need hose, nozzles, extension rods, strainer, measures and barrels for the spray mixture.

The spray nozzle which is proving very satisfactory now is of the wide Vermorel type, of which the "Friend" is a very popular style. This form of nozzle is sold by all the dealers in spraying supplies underone name or another, among which are the "Simplex", "Mistry" and "Cushman". These nozzles will cost 75c to $1.00 each. The small type of Vermorel is still the most satisfactory nozzle for general use and these can be obtained from dealers in spraying supplies, as can the rest of the accessories needed in spraying.

The hose should be of high grade, 1 in. or ⅞ in. in diameter and 5 to 7 ply, and for general use lengths of 25 feet will be sufficient. Sherman clamps are the best to hold the hose on the couplings, especially where subjected to any strain. The extension pole is of bamboo, 10 to 12 feet long, and lined with brass or aluminum tubing; coupling are provided for attachment of the hose and nozzles. The cut-off valve should work with half a turn. For a strain work with a half turn. For a strainer, one with 30 meshes of brass wire to the inch will be the most serviceable; the style will vary with the capacity.

Taking the cost of the complete equipment into account of spray outfit for use in the home garden will cost $10 to $12, while the equipment for the barrel pump will cost $30.00. The larger outfits will cost more in proportion, for they will require a more extensive outfit for preparation of the spray.

Butter Defects and How to Correct Them.

The following classification of butter defects and means of overcoming them was prepared by M. Michels, formerly in charge of the Wisconsin Scoring Exhibitions, and published in Bulletin 182 of the Wisconsin station. It is intended as a ready reference that will aid the maker in locating the cause of the most common defects and applying a remedy:

A DEFINITION OF GOOD BUTTER.

Flavor should be rich, pleasing, creamy and suggest nothing objectionable to either the taste or smell. Body, should be firm and waxy. Color, should be even showing a luster and an oat straw shade unless the particular market wants a different color. Salt, well dissolved and just enough to bring out the highest flavor of the butter. Package, clean and neat in appearance.

BUTTER FLAVOR DEFECTS.

1. Curdy Flavors: Indicated by a sour cottage cheese smell and taste.

Causes: 1f Adding wheyed-off starters to cream. 2. Adding an over-ripe starter while the cream is at too high a temperature. 3. Ripening a very thin cream at a high temperature.

Remedies: 1. Do not use a starter that shows whey on top. 2. Never add a high ripened starter until the cream is cooled down to 65 degrees F. 3. Cream should test 30 per cent or more butter fat, a lower testing cream should not be ripened much above 60 degrees F.

II. High Acid Flavors: Indicated by an excessive sour smell and taste.

Causes: 1. Over-ripening of the cream before churning. 2. The use of an over-ripe starter. 3. Receiving part of the cream in an over-ripe condition.

Remedies: 1. Develop less acid in the cream before churning. 2. Do not use a starter having over 0.70 per cent acid. 3. Cream containing over 0.50 per cent of acid should not be mixed with sweeter cream, but churned separately.

III. Lacking Flavor: Lacking taste and smell.

Causes: 1. Churning the cream too sweet. 2. Too much washing of the butter granules. 3. By using a dead or inactive starter.

Remedies: Cream should not contain less than 0.45 per cent of acid, even when a light flavored butter is wanted. 2. When butter is churned at low temperatures, one washing or rinsing is sufficient. 3. Never use a newly prepared starter until it sours readily.

IV. Rancid or Old Cream Flavors: Smells and tastes like old cream or old butter.

Causes: 1. Over-ripening the cream. 2. Holding the ripening cream too long before churning. 3. Ripening the cream at very high temperatures. 4. Holding some of the cream or milk too long before churning. 5. Keeping the butter at too high a temperature after churning.

Remedies: 1. When cream is kept over night to be churned the next morning, it should not contain more than .55 per cent of acid. 2. Cream should not be cooled down after ripening with the idea that it will keep its, fine, creamy, acid flavor until churned several hours later. 3. Start ripening the cream below 68 degrees F. 4. Old or over-ripe cream or milk should not be mixed with sweet cream, but churned separately. Milk or cream, even under the most favorable conditions should not be kept longer than two days. 5. After churning, keep the butter in the refrigerator at a temperature of 50 degrees or below.

V. Oily or Greasy Flavors: Indicated by an oily and greasy taste and smell.

Causes: 1. Holding the milk or cream at too high a temperature before delivering to the creamery. 2. Ripening, churning and working when at too high a temperature. 3. Using a poor grade or too much butter color.

Remedies: 1. Hand-separator cream should be cooled to 60 degrees within an hour after separating. 2. Do not ripen the cream above 65 degrees F. churn and work at low enough temperature so that one washing of the granules will take out all of the butter milk, it will then be in such condition that the butter will not turn greasy while being worked. 3. Never use bad smelling color or one that has a sediment at the bottom; use no more color than is necessary to satisfy your trade.

VI. Fishy Flavors: Indicated by bad taste and fishy smell.

Causes: 1. Uncleanliness in handling the cream and milk at the farm. 2. Leaky cream or milk vats at the creamery. 3. May be produced by certain species of bacteria.

Remedies: 1. Keep separators pails, cans and tanks for cooling clean at all times. 2. Never use a leaky vat, dipper or can for handling milk or cream. 3. If produced by certain species of bacteria it is certain that they grow in dirt, hence cleanliness is necessary.

VII. Stable Flavors: A bad taste and cow stable smell.

Causes: 1. Uncleanliness in milking. 2. Keeping the cream or milk in or near a dirty cow stable.

Remedies: 1. See that the stable and cows are clean before milking and milk with clean, dry hands. 2. All milk should be removed from the stable as soon as milking is finished. Never keep the milk or cream near the stable or manure piles.

VIII. Bitter Flavors: Indicated by a bitter taste.

Causes: 1. Holding cream too long a time at low temperature before churning. 2. May develop in the starter. 3. Bacteria brushed from the cow's udder while milking.

Remedies: 1. Cream should not be held at well-water temperature more than two days. Bitter flavors are often noticed in cream which is hung in the well or set in the spring for three or four days. 2. Set the starter with a small amount of mother starter at 70 degrees F. rather than a large amount at 55 degrees. (One quart of starterline to 100 pounds of pasteurized skim milk is sufficient.) 3. Milk clean cows in clean stables by clean hands.

IX. Weedy and Food Flavors: Indicated by weedy and food smell.

Causes: 1. Cows feeding on weeds. 2. Feeding strong scented food just before or during milking. 3. Exposing milk in an atmosphere laden with objectionable food flavors.

Remedies: 1. By giving cows a plenty of good pasture feed they will not eat weeds enough to flavor the milk. 2. Do not feed silage, brewer's grain or slightly decayed feed shortly before or during milking. 3. Do not keep milk in the same room with feed of any kind.

X. Unclean Flavors: Unclean smell or taste.

Causes: 1. Dirty cans and milk utensils. 2. Dirty water may cause an undesirable aroma, but nothing objectionable to the taste. 3. Impure air and dirty starter may give an undesirable taste, but nothing objectionable in aroma. 4. When the judges fail to find words to describe a flavor, this expression is used as a last resort.

BODY OR TEXTURE DEFECTS.

I. Weak Body: Soft and weak when pressed with thumb or finger; sometimes coarse in appearance.

Causes: 1. Ripening, churning and working at too high temperatures. 2. Cream not cooled long enough before churning. 3. Too much moisture in butter. 4. Character of the butter fat.

Remedies: 1. Ripen, churn and work the butter at as low a temperature as practicable. 2. Remember that with cream churned right after being cooled down from 60 degrees, the churning temperature may have to be lowered to 50 or below, while cream kept at 55 over night may be churned safely at 57 or 58. 3. By employing the ordinary methods of washing and working not over per cent of moisture will be left in the butter. 4. Change the feed of the cows. This trouble is seldom found in the butter fat from mixed herds.

II. Greasy Body: No grain, dead in appearance.

Causes: 1. Over-churning of the butter. 2. Over-working. 3. Washing the butter granules in too warm wash water. 4. Churning and working at too high temperatures.

Remedies: 1. Stop churning when the granules are about the size of wheat kernels. 2. Work the butter no more than is necessary. 3. Never use wash water above the temperature of the butter-milk when drawn. 4. Churn at low temperatures so that the butter granules will not stick together while washing.

III. Body Showing Too Much Moisture.

Causes: 1. Stopping the churn when the granules are too fine. 2. Under-working the butter.

Remedies: 1. Churn granules to the size of wheat kernels. 2. Work but once and until smooth and waxy.

IV. Milky Brine.

Causes: 1. Churning at too high temperatures. 2. Over-churning. 3. Improper washing.

Remedies: 1. Churn at lower temperatures so that the granules will not stick together. 2. Churn until granules are about the size of wheat kernels. 3. Fill the churn with wash water about the same height in the churn as the cream occupied when the churning started.

V. Color: Mottled appearance.

Causes: 1. Uneven distribution of the salt. 2. Using too cool or too warm wash water. 3. Not enough moisture in butter when worked. 4. Churning too warm.

Remedies: 1. Distribute and work the salt evenly. 2. Have the wash water about the same temperature as that of the butter-milk when drawn. 3. Leave enough moisture in the butter so that the salt will readily dissolve while working. 4. Churn the cream at a temperature low enough to prevent the granules from sticking together and allow the butter-milk to be washed out, then salt is quickly and more easily distributed and dissolved. Streaked butter is simply a mild case of mottles.

VI. Color Specks: Tiny color specks which appear throughout the butter.

Causes: 1. Using a poor grade of color. 2. Allowing the color to become too old. 3. Keeping the color at too high a temperature.

Remedies: 1. Buy only the best grade of color. 2. Buy in small quantities. 3. Never keep the color near a radiator or boiler.

VII. Salting Defects: Indicated by taste.

Causes: 1. Too coarse, gritty. 2. Unevenly distributed. 3. Too low or too high.

Remedies: 1. Leave enough moisture on the granular butter and work sufficiently to dissolve the salt 2. Distribute evenly and revolve the churn a few times before setting rollers in motion. 3. Too little salt often fails to bring out the best flavor. Too much salt leaves a coarseness of taste that covers up the fine, creamy flavor so much desired in butter.

VIII. Package defects.

Causes: 1. Bad appearing, dilapidated package. 2. Badly trimmed and dirty on top or sides. 3. Butter not packed solid.

Remedies: 1. The package and covers must look neat and clean and not be too old. 2. Cut top of butter with a string or wire and wipe the dust out of cover before placing it on the tub. 3. Pack small amounts of butter in the tub at a time and use the packer after each addition. Strip the tub from the butter occasionally and note the appearance of the butter surface.

War on the Weeds.

Are you preparing to wage an incessant war against the noxious weeds in your fields this year? Study the life history of the weeds and then follow the most feasable methods for eradicating them. Different weeds will require different treatments for combatting them.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmer of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for dis. continuance is given.

The date after your name on the little green label on front Page is, in every case, the time which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser be said :—**"I saw" your adv. in the MARITIME FARMER.**

RATES FOR CASUAL ADVERTISEMENTS.

WHAT CAN WE AFFORD.

The following from a recent issue of the Maine Farmer is worth passing along:

"A short time since I heard a working farmer "say in all seriousness, "I can't afford a sanitary "barn, and if pushed shall have to go out of the "milk business." There is no question but hundreds "feel the same and the unjust and arbitrary require- "ments of the Boards of Health are largely respon- "sible for the decline of our dairy work. At the "same time every man wants just what the city "officials are aiming at, that is healthy, neat and "clean conditions in the barns. We are all learning "that what once sufficed will not answer today, and "for the reason the little seven by nine sleeping "room, opening directly from the living room, and "with but a single window is being discarded. "More air, more sunlight for the sleeping rooms is "now demanded. We are finding that sunlight is a "germ destroyer and pure air an invigorator and so "are opening up to receive the most of God's choic- "est blessing. This is as true in the barn as the "house and slowly is coming. The greatest obsta- "cle is the want of a clean, common sense idea of "what is sanitary and here the rules and construc- "tion placed on the same by the board of health, are "at fault. In one city it was required "that every "cow furnishing milk for that city trade should stand "upon a platform not less than eight feet long." "The man who made that rule either did not know "the length of a yard stick or had never been inside "a sanitary milk barn. This is only on a par with a "lot of the senseless stuff printed and sent broadcast "by those who assume to say what is and what is not "healthy.

"On the other hand every man may have a sanitary tie-up and produce normal milk, healthy and "below the bacteria count established. While the "King system is the ideal for ventilation, it must be "constructed by a skilled mechanic and even then is "not to be relied on. Any man can stop throwing "the manure out under the eaves, can whitewash the "tie-up, can put in long windows and use thin muslin "instead of glass, can sweep down the cobwebs and "keep the floor clean, can bed the cows, can wipe "down the cow's sides and udder with a damp cloth "before milking, and certainly can have his hands clean when he milks. The whole trouble with milk "comes after it leaves the cow's teats, and if condi- "tions are all cleanly and the milk is removed as "soon as drawn from the udder and put at once into "clean cans where it can be kept at a low temper- "ature there is no danger of trouble with any board "of health. These officials aim at a clean product "and this the farmer wants to produce. Sanitary "conditions are only clean conditions made healthy at "every step and this every man wants for himself, "his family and his customers. Cut out the sense- "less frills but make the tie-up roomy, sunny, clean "and sweet and good milk and more milk will fol- "low."

A BOER GIRL LEARNS FROM CANADA.

A young woman always optimistic, keen to notice all of an educative nature, and enthusiastic over anything Canadian, and not afraid to show it, is Miss Jeanette C. van Duyn, the dutch girl from Transvaal who is now studying at Macdonald College at St. Anne de Bellevue, and will go to Guelph Agricultural College during the fall term. This young woman represents the pioneer educating influence in the establishing of a system of domestic economy among the agricultural classes of the Dutch in South Africa. She has come to Canada as the special representative of the Agricultural Department of the new Government of the Transvaal.

"Dutch people, the women, especially of the farming classes, are most backward in everything pertaining to household economy," Miss van Duyn declared. "That is the reason I was sent here. I had read a great deal of what Canada was doing for her agriculturists at MacDonald College and Guelph, so I got my Government to take up the idea, and they commissioned me to study conditions. I will be in this country nearly two years, when I return to the Transvaal to teach what I have learned. My special object will be to organize a system of woman's institutes, which seem to be doing so much for the women who live on the farms of Ontario. It is these women of my country who need looking after; for all these years they have been pitiably neglected.

"Am I native Dutch?" she paused to answer the interjection. Then she laughed one of those infectious laughs. "Oh, yes. Call me a Boer. Indeed, when the war ended I could not speak a word of English. But I soon learned that it would be essential to my future; and I was one of the first to learn the tongue. Finally I got along so well that I was used as a translator of important Government documents.

"Canada is so lovely that I cannot realize it at all," she laughed in answer to a question. "I never saw snow until this winter. And, do you know, when I used to look out of my window in the mornings across the beautiful white fields and far up the ice-locked Ottawa River, all covered with the clear, white crystals, I had to pinch myself to make sure I was not in fairyland. It makes me want to keep on stopping here—for we have nothing that can compare with your scenic beauties. At least I have one firm resolve: The minute I return to my native land my whole ambition will be to start at once to save money for another trip, and soon, to Canada."

It is only ten years ago that Canada was cheering over the success of her soldier boys on the battle-field at Paardeberg. The Empire was in the throes of the terrible South African war. Yet within that short space of time a Boer girl comes here to copy our institutions for the benefit of the people whom we fought.

"The sentiment is all changed in the Transvaal now," she tells you. "We Boers cannot but appreciate the liberal way in which Britain treated us. When we were given our own parliament it was wonderful how differently people began to regard England. The old feeling of hatred is fast dying out. My people look upon England as their friend. Because England has done more to assist the farmer than was ever done in the past in our country. Of course there are some Boers in the backlying countries who still feel antagonistic, but every year this is being more and more overcome, when the benefits of England reach farther and farther inland. Even now I believe the British feeling to be strong enough to prompt our men to go out in Britian's cause like Canadians or any other of the colonies in defence of the Empire.

"Here at Macdonalds College, with so many hundred young men representatives of the Agriculturists of Canada, I cannot but note the advantages they have had over the Boer boy. He is years behind the times compared with the young Canadian.

"The war?" she echoed the question, and a seriousness came into her ever-happy face. "It was horrible. We felt so bitterly against our oppressors. We felt so crushed at defeat. You can never imagine it; no one can unless he is on the side of a great losing struggle. To feel the hand of the enemy getting tighter and tighter upon you, like some great octopus, until finally you are crushed in the awful grasp.

"I was in Pretoria throughout the war. We there felt so safe. Our town so snug, surrounded by kopjes, all fort-crowned, seemed to us quite secure. Then imagine our great surprise one morning—Oh, I remember it so vividly—the khaki-uniformed soldiers came swarming over the hills like locusts, into the valley of our town. We were prisoners! Oh, I shudder even yet. It was as an horrible nightmare. We could not but pity the poor soldiers. They were food crazy. They were ravenously starved. You know we Dutch people each have our own great family bake oven behind our homes. There is no bread peddler, like in Canada. That morning the Kaffir boy was baking our bread. The hungry soldiers saw him. They needed no invitation to eat. But they broke open the oven and snatched the still smoking bread and devoured it all. Strong as were our sympathies for our fellow countrymen, we took these men, our foes, and fed them with the best we had in our homes. Anyone would have done the same.

Miss Van Duyn is undoubtedly the popular girl of the college term. Save for a slightly noticeable accent, a somewhat broken English, there is little to tell the stranger that this young woman is Dutch. She is now quite Canadianized in views and manners. "Snowshoeing! It is great. Skating! It is delightful." Her only complaint is that that there is so much to learn that she will not be able to master all before her return.

Miss Van Duyn has proved one of the brilliant science students of Macdonald College this term. She has just been appointed by the Ontario Government to go on a lecture tour of the Women's Institutes of the Province during June. For a month she will study conditions in the Department of Agricture in the Parliament buildings, and with the fall term will enter Guelph Agricultural College.

Is there not a lesson in the foregoing article for the women of our Maritime Provinces? In last issue we sent forth a plea for more work along the line of Women's Institutes in Maritime Canada. It was shown how strongly the province of Ontario is organized for institute work. And now we find a Dutch girl from far off South Africa, in Canada for the purpose of learning Canadian ways re Women's Institutes.

We have an institution at Truro where special short courses in Domestic Economy are given every winter and yet how many of our young women do we find attending them? Not near so many as might attend. Our Maritime ladies are equal if not superior to any other on the face of the earth and we trust that each and every progressive girl and woman will strive to attend the short courses at Truro next winter and then we fieel confident organization will surely follow.

Last Session of the N. B. Committee on Agriculture.

The last meeting for the session of the Committee on Agriculture was most interesting and successful. Many practical suggestions were made and useful ideas advanced. Action by the Department of Agriculture upon the resolutions adopted will result in a larger interest and more practical results from the activities of the Agricultural Societies; and a most important advance movement was inaugurated in the recommendation that the Department conduct an experimental farm, even if only in a small way.

At the opening of the meeting Mr. Burgess moved, seconded by Mr. Sheridan, that the Department of Agriculture should provide for adequate supervision and encouragement of Agricultural Societies and inspection of their work and accounts, to ensure careful and systematic work by all Societies, and the accurate and prompt accounting of the monies they handle.

This resolution was unanimously adopted and precipitated a general discussion about the wisdom of the Societies holding annual or semi-annual fall fairs. Although no formal resolution was presented the following suggestions were approved by the Committee.

(a) That the dates and prize lists of all proposed exhibitions be submitted to the Commissioner for Agriculture.

(b) In the case of male animals or birds no prizes be given to other than pure breds.

(c) At least one judge to be furnished by the Department of Agriculture whose hotel expenses should be paid by the Society holding the exhibition.

(d) Facilities to be afforded visitors to see the judging of all live stock classes and the judges to explain their awards.

(e) All cheese and butter exhibits judged by the score card system.

(f) Prizes should be given to encourage school children in the growing of vegetables and flowers and in selection of seed grain.

(g) An evening meeting should be held when the judges should give addresses and point out the lessons to be learned from the exhibition.

Mr. Pender suggested that there should be sale days in each parish at least twice a year, where live soock, seeds, etc., could be brought together to the mutual advantage of buyer and seller, and that pamphlets upon different topics of agricultural information should be frequently printed and distributed by the Department of Agriculture.

Mr. Hubbard stated that it was the idea of the Commissioner for Agriculture that an assistant be employed in the Department who can speak French, and part of his duty will be to visit, instruct, advise and encourage the Agricultural Societies in French districts and the Deputy commissioner would do likewise among the English Societies.

The following resolution was adopted on motion of Mr. Pender, seconded by Mr. Leger (Gloucester) whereas, the various Agricultural Societies of the province in importing and placing live stock etc., frequently desire to sell such importations among their members by auction; and, whereas, these societies as well as private individuals who impart or deal in live stock find essential to success to employ auctioneers who have knowledge of the breeding and special value of live stock; Resolved, that it would be in the interest of the live stock industry to have legislation enabling Agricultural Society officers, or a man employed by them, to legally sell such stock by auction, and also to make it legal to employ special live stock auctioneers to sell, irrespective of where they may be registered in Canada.

Mr. Leger, Westmorland, thought that a start should be made by the Department upon an experimental or model farm for the province.

He moved the following resolution, which was seconded by Mr. Sheridan and passed unanimously:—Resolved, that the Department of Agriculture be recommended to make use, as far as possible, of the splendid facilities at the Provincial Institution at Fairville for agricultural experimental purposes, with special reference to increase of soil fertility; and that experiments be made during the present season in the application and use of commercial fertilizers.

A vote of thanks was extended to Mr. W. B. Dickson the chairman, on motion of Mr. Sheridan, seconded by Mr. Pender, as follows:—Resolved, that the thanks of this Committee be extended to the Chairman for the able manner in which he presided over the meetings of the Committee, and for the deep interest he has taken and is manifesting in agriculture in our province, as evidenced by the greatly increased interest in this Committee, and further shown by the organization of a large and flourishing Agricultural Society at Hillsboro due very largely to the energy and activity of our Chairman.

Report of the Dairy and Cold Storage Branch.

Everything looks favorable for dairy production during the coming season. The cows have wintered well and there is plenty of feed. The pastures are in excellent condition and show no signs of winter killing. According to present indications the grass will be fully three weeks earlier than last year. These are the conditions along with an early season, which will make for an increased output and a smaller percentage of "fodder" cheese and butter.

It is impossible to say what the development will be in the shipment of cream to the United States. Articles on the subject, emanating apparently from the produce trade in New York, have been going the rounds of the press during the past week promising a big development of this trade. These articles are evidently inspired with the object of influencing the butter market. The conditions are too uncertain to warrant the building "of a chain of creameries along the Canadian Frontier," as is suggested. Everything depends on the comparative prices of butter in Canada and in the United States This trade is not desirable from the Canadian standpoint, because of its uncertainty. The individual producer who receives a higher price for his cream than he could get for it in Canada will, of course, be satisfied as long as that condition continues, but the moment it becomes unprofitable to the United States importer the market is gone and the disorganization of the cheese factories and creameries, which must follow, if there is any large export of cream, will then be seriously felt.

The apple season of 1909—10 has been rather unsatisfactory to many engaged in the export trade. The crop was a fairly large one and the high prices paid in the fall induced growers and packers to market many apples of very inferior quality, making the total quantity marketed much larger than was expected. The high price to the consumer, coupled with poor keeping quality owing to the warm weather in the autumn, discouraged consumption in a very marked degree and the inevitable slump followed. The situation was made all the worse on the local market by the comparatively low price and large quantity of oranges offered. It has been very common during the past winter to find oranges being sold cheaper than apples in the same shop. Notwithstanding the slump in the wholesale market and the large quantity of apples yet undisposed of, the retail price has been maintained at a high figure in many cases for very inferior fruit. Much of the stock put away by retailers and jobbers in cellars and other unsuitable places has not kept well, and the apples offered for sale have presented a very unattractive appearance. Nothing so much encourages the sale of apples as a display of sound, handsome fruit of the right variety.

The experiments in the storage of apples which this branch of the Department has been conducting during the past winter, by authority of the Minister of Agriculture, has shown conclusively the possibility of keeping apples in a sound condition and without waste if placed in cold storage as soon as taken from the tree, no matter what the conditions are at harvest time. Seven car loads of apples were purchased in the orchards last fall and were removed to cold storage immediately after being picked. They have been carried at a temperature of 30 to 32 degrees all winter, and to-day at London, St. John and Montreal we have Baldwins, Greenings and Spies in perfect condition, crisp and juicy, showing no appreciable waste. Apples that were packed in barrels in the orchard last fall are being shipped now without re-packing. This saving will pay the extra cost of cold storage Cold storage of apples is not always so successful, for the reason that they are generally allowed to remain too long after picking. There is no use of depending on cold storage to preserve over-mature, bruised or imperfect fruit.

Full details of these experiments will be published in bulletin form as soon as the final results are available.

Robert Coyle, jr., of Colborne, Ontario, was recently fined $100 for altering the grade marks on a shipment of apples after it had been passed by a Dominion Fruit Inspector.

Arrangements have just been completed through this office with the different railway lines for a continuance of the iced butter car service. The service began on May 16th and continues until October 15th. The Department of Agriculture will, as in the past, guarantee two-thirds of the earnings on a minimum car at current tariff rates, plums $4 per car for icing. The cars are operated over regular routes on specified days every week during the period mentioned to pick up butter in any quantity. Without this service shippers of less than carlots would be obliged to ship in ordinary cars or pay charges for a minimum carload (24,000 lb.)

The question of cold storage has been much in the public eye during the past few months and some very stupid and senseless things have been said about it. Suggestions to limit the period of storage ignore the fact that the condition of the goods when placed in store is of infinitely greater importance than the length of the storage period. There may be abuses—there are in most lines of business—but the broad facts remain that the cold storage warehouse enlarges the market during the periods when surplus stocks are available and thus encourage production, and it is, after all is said, the law of supply and demand which regulates the price of food products.

J. A. RUDDICK,
Commissioner.

Report of the Seed Branch.

Complaints have been made that the object of the Seed Control Act were in part being defeated in the clover seed producing districts through farmers trading among themselves with seed of inferior quality. It is claimed with good reason that if this practice becomes at all general it will be detrimental to both farmers and seedsmen, as the sowing of impure clover seed must result in lowering the general quality of future clover seed crops. Investigations that have thus far been made by seed inspectors indicate that considerable seed is this year being exchanged among farmers, but the charge that this seed is largely low grade is not born out. In the average only one inferior lot is is to be found on sale out of every twelve farmers' lots that are offered.

There is a special reason why the trade among farmers is larger than usnal this season. Many of the retail seed merchants ordered their clover seeds in December and January and paid the relatively high prices which then prevailed. In February the offerings of clover seed were more abundant and the prices were reduced accordingly. This reduction in price of seed has enabled farmers to sell to their neighbors at a lower price than the retail seed merchant who purchased early in the season have had to charge. In the sale of timothy, red clover, alsike and alfalfa seed farmers are liable to prosecution the same as seed merchants, and an additional number of inspectors have been added this year to secure the observance of the Seed Control Act on the part of farmers as well as seed merchants.

Farmers who have to buy their supplies of grass and clover seeds continue to be humbugged by the term, "Government standard," which is used by seed merchants to indicate seed of a quality that is not forbidden from sale by the minimum standard of quality named in section 8 of the Act. Farmers have not as yet come to understand the difference between No. 1 seed as defined in section 7 of the Act, and which allows only twelve weed seeds to the ounce of red clover, and the so-called "Government standard," which is really second or even third quality and which allows as many as 52 weed seeds to the ounce of red clover.

The amendments under the Seed Control Act, which are outlined in the December Monthly, were assented to and became law on the 17th of March. Under the amended Act certain additional regulations are fixed by the Government in Council. By these regulations the vitality standards of the different kinds have been fixed, and, in addition, the number of weed seeds which may be tolerated in No. 1 timothy, red clover and alfalfa seed has been reduced to five to the ounce, and No. 1 alsike to ten to the ounce.

At a joint meeting of the executive of the American Seed Trade Association and the State Seed commissioners held in Boston last December it was agreed in principle that the most satisfactory regulations for controlling the grass and clover seed trade of the United States would be on the basis of definite standards for the different grades, and that all seeds offered in the wholesale or retail trade should be graded according to those standards. It was found however, that an agreement could not be reached as to the definition for the standards of the respective grades, and, in lieu thereof the American Seed trade Association recommended that the trade in general be required to brand their packages of ten pounds or over with the actual percentage of purity.

Nearly all grass and clover seed offered to the trade in Canada are sold under grade names which have no meaning to the consumer. Experience in administering the Seed Control Act has shown that it would be in the best interests of good seed men as well as of farmers if the system of grading which is now commonly adopted by seedsmen were made uniform and according to definite standards of quality, taking into consideration particularly the noxious weed seed content. No. 1 timothy, red clover and alfalfa might be allowed to contain five noxious weed seeds per ounce, which would include approximately 25 per cent of the crop produced, twenty per ounce for No. 2, which would include an additional 35 per cent of the crop produced, and not more than eighty weed seeds per ounce for No 3 quality, which would include an additional 25 per cent of the crop produced, leaving a balance of 15 per cent prohibited. To get the same proportion of the crop produced in the different grades for alsike, twice the number of weed seeds per ounce would have to be allowed for each grade. It can scarcely be disputed that terms such as No. 1, 2 or No. 3 have more meaning, when applied to quality of any commodity, than have the names of birds, animals or fish, which are now most commonly used by seedsmen.

(Continued on page 534.)

HORTICULTURE

Insects and Diseases Affecting the Strawberry.

There are comparatively few insects and diseases which cause serious injury to the strawberry and in this bulletin, only the most important are described. The information in regard to insects has been taken mainly from the reports and other publications of the late Dr. James Fletcher, formerly Entomologist and Botanist of the Experimental Farms.

WHITE GRUB: (Lachnosterna fusca, Froh.)—The white grub often does much damage in strawberry plantations and sometimes gives fruit growers a great deal of trouble. If, however, the life-history of the insect is known and proper methods followed, it may be controlled. In brief, the method recommended by the late Dr. James Fletcher, Entomologist and Botanist to the Dominion Experimental Farms, is to take only one crop of fruit from a plantation and then plough it up, thus preventing the insect from passing through all its stages and so destroying it. Land for strawberries should be prepared by growing some crop that the white grub will not touch, and thus offering no inducement for them to stay in the soil

As the growing of other crops which the white grubs are fond of, near the strawberries may be the means of introducing them to the strawberry plantation, the following description of the life-history of this insect and the general remedies suggested are given. These are taken from Bulletin 52, "Insects Injurious to Grain and Fodder Crops and Vegetables," by Dr. James Fletcher:

"White Grubs are the larvae of the May Beetles or June Bugs, so called from their great abundance in May and June, when they may be found in large numbers flying around trees and bushes, showing particular preference for certain kinds, as willows, oaks, ashes, plums, maples and lilacs. The eggs are deposited in the ground, one to three inches below the surface, and hatch in from ten to eighteen days. The larvae feed on roots during the remainder of the season and burrow very deeply into the ground as winter approaches, returning again the following spring and doing a great deal of harm by eating the roots of grasses and many other kinds of plants, particularly corn and potatoes, their injury being most noticeable in the second year after sod has been ploughed down. It is claimed by Dr. S. A. Forbes that a second winter and summer is passed as a larvae and that the grubs do not change to pupae till June and July of the third season, the perfect beetles issuing from the pupae two or three weeks afterwards, but passing the third winter in the pupal cells and emerging the following June. Thus three full years are consumed from the time the eggs are laid until the perfect beetles appear."

STRAWBERRY WEEVIL: (Anthonomus signatus, Say).—The Strawberry Weevil frequently does much harm by cutting off the flower buds, the stem being severed close to the bud. The grub of this insect feeds on the pollen of the flowers and after the female has laid an egg in the bud she cuts the latter off so that it may not develop. The unopened bud falls to the ground and the grub of the weevil developes inside it. There is only one brood of this insect in the year. The beetles appear in August and then hide away beneath moss or among bushes and remain in a lethargic condition until the following spring. The varieties of strawberries chosen by the female for egg-laying are those which produce much pollen, as it is chiefly upon that part of the flower that the grubs feed. Varieties of strawberries which are bearers of pistillate flowers only are not attacked; consequently when the strawberry weevil is abundant, growers will do well to plant a large proportion of pistillate sorts only, using enough plants of perfect flowering sorts as will insure the proper fertilization of the fruit.

As the Strawberry Weevil passes the winter in the mature beetle form, and flies to the strawberry buds just before the flowers unfold, when the work of the weevil is noticed in spring, it would be well, where it is practicable, to cover the rows of perfect flowering plants with cheesecloth until the flowers are well opened. Trapping the beetles, it is claimed, has produced good results. For this purpose, pollen-bearing plants should be planted in rows near the bearing beds, and when these are found to be covered with the beetles, the plants may be sprayed with the whale-oil soap solution, one pound in five gallons of water, or with the kerosene emulsion.

STRAWBERRY LEAF-ROLLER (Phoxopteris comptana, Froh.)—The Strawberry Leaf-roller has not proved very troublesome in Canada, but, occasionally, it does considerable injury.

The caterpillars of this insect fold the leaves of the strawberry by drawing the upper surfaces together and fastening them with strands of silk. They then eat away all the green inner surface of the leaves, giving the beds a brown and seared appearance. The first brood of caterpillars is found during the month of June, when most of the injury is done. There is a second brood in autumn. The caterpillars, when full grown, are about one-third of an inch long and vary in color from yellowish-brown to dark brown or green. The first brood turns into chrysalis in late June or in early July and soon hatches into moths which lay their eggs for the second brood in late July. The larvae of this second brood hatch and attack the strawberry leaves in late summer and early autumn. By the end of September the insect is again in the chrysalis stage in which it passes the winter.

REMEDY.—Spray with Paris green, 4 ozs. to 40 gallons of water, or with arsenate of lead, 3 lbs. to 40 gallons of water, before the leaves become folded. Several applications are necessary, as new leaves are appearing all the time and the hatching season of the eggs extends over a considerable period. Spraying should not be done while the plants are in full bloom, nor after the fruit has formed. If a bed becomes infested, the foliage should be burned, or raked off and burned immediately after the crop is harvested.

CUT-WORMS.—Cut-worms sometimes do much injury in the strawberry plantation, especially the climbing species. They do their destructive work at night and though the injury to the leaves or roots is apparent in the morning, the cut-worms have disappeared. They may usually be found secreted in the surface soil not far away from the plants they have injured.

REMEDY.—Whern either the climbing or non-climbing species is troublesome, or where injury is done to either leaves or roots, the most effective remedy is poisoning with a mixture of bran and Paris green, in the proportion of one-half pound of Paris green to 50 pounds of bran. The bran is slightly moistened before the Paris green is added so that the latter will mix better with it. This poisoned bran, of which the cut-worms are very fond, is scattered on the surface of the ground about the plants.

LEAF BLIGHT: RUST. (Sphaerella fragariae, Sacc.)—This disease does much injury to some varieties of strawberries by reducing the healthy leaf-surface and so lessening the vigor of the plants. When thus weakened, the plants are unable to develop fruit properly, the crop is much lessened and the quality of the fruit is poorer. Fewer and weaker runners are also made Some varieties are much more affected than others and, where this disease is troublesome, those should be chosen which are the least affected by it. This information is given in the description of varieties published in this bulletin. It has been noticed that strawberries are more affected by the leaf blight when grown on sandy loam than on clay. The first indication of this disease is the appearance of round purplish or reddish-brown spots on the leaves during early summer. By the close of the picking season and often during the middle of it, these have become very numerous. The spots, which are at first small, also increase rapidly in size and often coalesce, thus involving a large proportion of the leaf, which finally withers. As the spots increase in size, the centres become white and from this white portion are given off myriads of spores which are carried to other leaves and plants, thus propagating the disease. Later in the season, winter spores are developed from the same spots, but these are carried over winter in small sacs which are attached to the leaf. These sacs do not permit the spores to escape until spring, when they cause the first infection.

Bordeaux mixture will check this trouble if thoroughly applied. In order to control the disease it is necessary to begin spraying just when the leaves unfold in the spring, to destroy the winter spores. A second spraying should be made as soon as bloom has fallen, a third immediately after the fruit has been picked, and, if possible, a fourth later on. New plantations should be sprayed during the growing season at as frequent intervals as are necessary to keep the foliage covered with the mixture.

Some growers burn the foliage as soon as the picking season is over. The foliage is mowed off and then fired. An experiment was tried at the Central Experimental Farm to test the value of this method, twenty-nine varieties being burned, while a similar area of the same varieties was not burned. It was found that when there was an extra amount of litter lying on the rows, the crowns of the plants were somewhat injured by burning. The aftergrowth of the plants burned over was luxuriant and healthy, but rust soon developed. At the close of the season, however, the treated plants were much healthier than those untreated. In small plantations, a good plan would be to mow the foliage and after raking it off, burn it in piles where there would be no chance of injury to the plants.

POWDER MILDEW OF THE STRAWBERRY. (Sphaerotheca castagnei Lev.)—The disease known as powdery mildew is not common in this country, but in one locality in Ontario, at least, it has done considerable harm and, as it may soon spread, it should be referred to here. When this disease is bad, it covers the fruit with mildew, making it unfit for sale or consumption. The grower does not usually notice the disease until it affects the fruit, but as a rule it starts on the under side of the leaves, which eventually curl up, and in order to control it, it must be treated early, as the plants cannot be sprayed satisfactorily when the fruit is developing, although ammoniacal copper carbonate might then be used. For spraying the foliage, Bordeaux mixture may be used or flowers of sulphur in the proportion of one part lime and two parts flowers sulphur. It is important that the under side of the leaves should be well covered and even the soil, so that spores may be destroyed. These are scattered early in the spring from the tiny sacs in which they are contained during the winter. They soon germinate and attack the leaves. As this disease spreads only on the surface of the leaves, it is readily controlled if treated at the proper time.

The Brown-Tail Moth in Canada.

Although the Brown-tail Moth (Euproctis chrysorrhaea), which was introduced into Massachusetts from Europe about 1890, has spread rapidly into the adjacent eastern states, causing great destruction to fruit and shade trees and physical suffering to the inhabitants, and involving an annual expenditure of thousands of dollars, it was not until 1907 that the first winter web of the caterpillars of this insect was found in Kings County, N. S., and sent to the Division of Entomology. This discovery was an indication that the Brown-tail Moth had established itself in Canada. Realizing the serious results that would follow its spread in Nova Scotia, the Department of Agriculture for Nova Scotia instituted a campaign which has been continued against the insect, and many thousands of nests have been destroyed annually in Kings, Annapolis and Yarmouth Counties, which were found to be infested with the insect. This prompt action cannot be too highly praised. Stray specimens of the male moths have been found since 1902 in New Brunswick, but as yet no signs of the insect having gained a foothold have been observed in that province.

Early in 1909 the winter webs, which the young caterpillars spin and in which they pass the winter in colonies of several hundreds, were found in New York State on nursery stock imported from France. The Division of Entomology at Ottawa was advised of this fact and steps were immediately taken to have all European nursery stock imported into Canada carefully inspected for these winter webs, in which stage the insect is most easily distributed but also most readily destroyed. Over a million and a half plants were examined and nearly two hundred winter webs were found on French stock. This inspection which, in the absence of the necessary legislation, was carried on with the voluntary co-operation of the nurserymen importing the stock, is being repeated, and during the present season, which is now closing, over three hundred webs, representing probably several hundred thousand of caterpillars, have been found in more than two million plants inspected. With the co-operation of the Customs Department of the U. S. Bureau of Entomology and of the New York State Department of Horticulture, the Division is advised of all shipments of European nursery stock, and these are inspected at the points of destination. So far as we can judge this careful inspection, in which we have been assisted by the Department of Agriculture of the provinces concerned, has prevented the introduction of the moth in nursery stock in which manner it was first introduced into this continent. Owing to the absence of the parasitic insects which keep it in check in Europe, where it is common but only occasionally seriously injurious, it has spread with astonishing rapidity. Being carried chiefly by the prevailing winds, it has spread northwards into Vermont, New Hampshire and Maine, and is now within a hundred miles of the Canadian frontier. As a result of a thorough inspection of the infested region in Nova Scotia, the writer is of the opinion that its control is possible by a thorough and systematic inspection and the destruction of all the winter webs, and that by prompt action the insect may be prevented from spreading into the forest and wild thickets. The caterpillars feed on hardwoods such as oak, maple, elm, ash etc., in addition to cultivated and wild fruits and thorn. Its establishment in the forests would render control impossible.

Circumstantial evidence supports two theories to explain its introduction into Nova Scotia: the chief means appear to be vessels trading between such ports as Bridgetown, Bear River, Digby, etc., and the port of Boston. One infestation could be explained only by the remarkable fact that the moths are carried across from Massachusetts to Yarmouth Co., N. S., by the wind; this

"Acadia" Lime-Sulphur Solution

Manufactured right in the fruit growing district to supply the needs of the Valley. Although this is the first season "Acadia" brand has been on the market, it is being used exclusively by the best orchardists in Kings and Annapolis Counties. Write at once for price and full particulars to

T. L. HARVEY.
Wolfville, - - N. S.

has been found to occur, but practically all the moths so carried are males.

This insect presents one of the most serious problems with which the Division of Entomology is and will be confronted. In the Eastern States it was allowed to assume large and uncontrollable proportions before action was taken, with the result that it soon spread over several thousand square miles, and now the only hope lies in the establishing of the parasites which are being imported from Europe, reared and released. Several species have become established, and it is hoped that by these means the insect will be ultimately controllled, by which time, however, it is safe to prophesy that it will have reached and crossed the Canadian frontier.—By C. GORDON HEWITT, D. Sc., Dominion Entomologist.

To Preserve New Potatoes.

It may interest Canadian potato growers to learn that by a simple and cheap method of preserving new potatoes, which has recently been tried in this country, genuiue English grown varieties will hereafter be procurable in winter and early spring at prices which it is stated, will bring them within the reach of the ordinary housewife. Hitherto, new potatoes in the winter months have been looked upon as somewhat of a luxury, but the plan devised is that these potatoes, bought in the height of the cheap season, can be successfully preserved for consumption during the winter months and compete with the supplies then usually imported from abroad.

The method of preservation is extremely simple. Large quantities of new potatoes are bought in August, when the price per pound only averages from two to three cents. These are stored away in tin boxes and buried under the ground. In some places they are placed in silversand as an additional preservative, but this is not essential. Some months later, before their skins are set, they are dug up. A similar process is also stated to be in vogue at Teneriffe, where the potatoes are placed in peat moss litter in boxes and buried underground. When withdrawn their skins are not only tender, but they are claimed to be the equal in every respect to fresh potatoes.

In the process lately tried in England, the potatoes require no attention during the period of storage, and, after being preserved in this way for several months, will be found to be very palatable at Christmas time and in the early spring. It is said that they still wear the appearance of ordinary new potatoes, and, when eaten, seem to have lost but little of their original flavor.

Nitrate of Soda

The Modern High-Grade

Fertilizer

Cheapest, Cleanest

Odorless

Can be used anywhere on any crop

Convenient for use

Increases your farm values

$3.00 worth of Nitrate alone on an acre of Grass has given an increased crop of 1000 lbs. of barn-cured Hay.

Prime hay has sold for $25 per ton in New York this season.

The Bread and Butter Age,

The growing child needs more good food at frequent intervals than the adult. Nothing is better and safer between meals than a slice of the good home-made bread. Formerly graham or whole wheat bread was favored; but Dr. Woods Hutchinson, the prominent hygienic writer, and other experts, have pointed out that the coarser flours are really less easily assimilated and are inferior in food value to the best white flour.

"Beaver" Flour

is a product uniting the merits of the coarser flours with the delicate, white, appetizing qualities appreciated by children and grown people alike. It is not a crude mixture, but an exactly proportioned scientific blend of Manitoba Spring Wheat and Ontario Fall Wheat. The famous Manitoba No. 1 Hard contains the gluten and proteids which build bone and sinew, and we balance this with the right proportion of the best Ontario wheat, softer, whiter and richer in carbohydrates, to make a perfect food. For bread, cake and pastry, use BEAVER FLOUR.

Popularity of Box-Packed Apples.

Mr. J. M. Mussen, Trade Commissioner at Leeds, England, Writes:

"One of the most important changes which the past season's trade in Canadian apples has brought to light in this part of England is the greatly improved popularity of box-packed apples. Many merchants now declare themselves to be whole-heartedly in favor of this system of packing apples in bushel boxes. Not only are these boxes, they say, more conveniently stored on the ship, but they are easier to handle in their warehouses, and meet a long felt want in supplying the demands of small retailers who cannot dispose quickly of the large amount of apples contained in the ordinary barrel. Although, of course, the retail price of the apple is slightly higher than that charged for fruit in barrels, yet the attractiveness of the packing and the selectness of the apples themselves is declared to be usually found sufficient to counterbalance any disadvantage in this respect."

VANCO Lead Arsenate

(Made in Canada)

"VANCO" Lead Arsenate is the surest safe-guard against wormy apples. If the trees are sprayed thoroughly within a week after the petals fall, it will kill the newly-hatched worms when they try to enter the apple, and save the fruit.

"VANCO" Lead Arsenate is more effective than Paris Green because it sticks better and is not so readily washed off by rain.

It is safer to handle than Paris Green because it is in paste form instead of powder, and safer to apply because it never burns the foliage.

"VANCO" Lead Arsenate is easily kept in solution and does not clog the nozzles. It shows plainly on the foliage, so that it is easier to make a thorough job.

10c. to 13c. per lb. according to quantity.

"VANCO" Lime Sulphur Solution

is a clean, concentrated liquid—free from sludge—all active material. Contains more sulphur in solution than other brands. One barrel makes 12 for spring or 50 for summer spray.

$8.00 per bbl. f. o. b. Toronto.

In "VANCO" Spray Chemicals we introduce the idea of High Quality at Lowest Price. "VANCO" Chemicals are prepared by practical men, and have successfully passed Government analyses and practical tests.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Washing Dairy Utensils.

The importance of keeping all dairy utensils clean and sweet needs to be emphasized once more, at this, the beginning of another dairy season. Success in dairying means attention to details. With many dairymen, the "washing up" is not looked upon as being very important and, consequently, is often neglected.

Milk pails and separators should be washed and scalded at least once a day and better every time they are used. For washing, a brush is better than a dish cloth. The latter is not a sanitary article, and is a favorite harboring place for bacteria. A brush can be thoroughly cleaned, but a dish cloth can't, unless it is boiled after using. There are brushes made especially for cleaning pails, cans and separators, and every dairyman should have one.

In washing dairy utensils the first water used should be only lukewarm not hot; on the other hand the water should not be too cold. The work will be done much easier if some alkali powder is used with the water. A little commercial baking soda is as good as any. Put a teaspoonful or two into the water, and it will have a wonderful effect in brightening the pails and cans. Soda may be a little more expensive than some other substances that might be used, but it is always on hand, which is something.

But washing in lukewarm water, even if some alkali substance be added, is not sufficient. If one were to examine through a powerful microscope a milk pail after being thus washed, a whole army of living bacteria would be seen. These need to be destroyed before the cleaning or washing can be said to be completed. The simplest and best way to kill this germ life is to thoroughly scald the utensils in hot water. This will kill all germ life unless the pails or cans have seams or crevices that the hot water will not reach. Some, instead of scalding, will place the parts in a hot oven for a few minutes. This serves the same purpose, but it is not as safe a plan as scalding, as one is apt to leave them in the oven too long, when the solder melts and the utensils become useless.

After scalding it is not necessary to wipe tinware with a dry cloth. If rinsed in scalding hot water the pails will soon become perfectly dry and especially so if exposed to the sun. Sunshine is nature's best disinfectant and germicide. It is darkness and dampness that promote bacterial development, not sunshine. Every dairyman should have a regular drying place on the sunny side of the house and the dairy tinware should be kept there after washing. The parts of the cream separator should be placed there when washed.

J. W.

Use of Fat-Saturated Alcohol to Solve Difficulty.

Prof. E. H. Farrington, of The University of Hisconsin, writes as follows:

One of the important points in testing cream by the Babcock test is to measure the fat accurately after it is separated in the neck of the test bottle. The bottom of the fat column is approximately a straight line, but the top has a concave surface, or meniscus, which often occupies a space of nearly one per cent of the graduated scale on the neck of the bottle.

Considerable discussion has arisen as to whether the fat should be read to the top, the bottom, or to some other point on this meniscus, experiments have been made by the dairy division of the United States departments of agriculture for the purpose or locating accurately the proper point for reading the top of the fat column.

This uncertainty can be entirely overcome by dropping a small quantity of alcohol into the neck of the test bottle after the cream test is completed. The alcohol floats on the fat and changes its concave surface to nearly a straight line. This use of alcohol has long been known, but as alcohol dissolves fat, the practice is not to be recommended, as it reduces the length of the fat column somewhat and therefore gives too low a reading of the per cent. of fat.

USE OF ALCOHOL WITH TEST.

The suggestion has recently been made by Dr. Babcock that this solvent action of alcohol on fat can be overcome by first adding to the alcohol all the fat it will dissolve, and then pouring a small quantity of this fat-saturated alcohol on the top of the fat column in the test bottle. This method of reading the fat in cream testing has been in use for some time at the Wisconsin dairy school with very satisfactory results. The top and the bottom of the fat column appear as nearly straight lines, giving two exact points between which the fat can be measured.

The fat-saturated alcohol is prepared by adding about a teaspoonful of butter fat to six ounces of alcohol in the bottle. Warm and shake the bottle until the alcohol has dissolved all the fat possible; some of it will be left undissolved at the bottom of the bottle. It has been found convenient to remove the fat-saturated alcohol from the bottle by means of a glass tube which extends through the cork to near the bottom of the bottle. By placing a finger over the top and lifting the tube out of the bottle, a small quantity of the liquid can readily be transferred to the cream test bottle.

This fat-saturated alcohol should be used for reading the tests as soon as they are completed, while the fat is still liquid. A little shaking of the test bottle after adding the alcohol will sometimes make the line between the fat and alcohol more distinct.

Bovine Tuberculosis.

Bovine Tuberculosis is costing the United States millions of dollars yearly, not through the actual death of tubercular animals but by the tubercular animals infecting the

Simplicity of Construction means durability—easy running

The Frictionless Empire has *fewer wearing parts* than any other cream separator. For instance, it has no closed bearings on the spindle where other separators have at least one and generally two. The less parts the less wear—the less chances for getting out of order.

The EMPIRE Line of Cream Separators

You don't have to be a mechanic in order to take the Frictionless Empire apart and put it together again correctly. The Frictionless Empire is so constructed that each part is made to fit just one place and to go in that place in one way only. It is simply impossible to put the parts of Frictionless Empire together wrong.

The Frictionless Empire outclasses all other cone separators the same as the Empire Disc outclasses all other disc machines.

Whichever style of Empire separator you choose you are bound to be satisfied, for both are sold with a guarantee as good as a gold bond.

Some day you'll own an Empire—the sooner the better for you.

Send for our new 25c book. Most unbiased book on separators ever published. Tells the truth about the two standard methods of cream separation. We will mail you one copy free providing you tell us the number of cows you keep. Also name of this publication. Send immediately. Extra copies, 25c. Ask for book No. 66

There is an Empire dealer in almost every town in Canada. If there isn't one in your town write us direct for special offer. 6

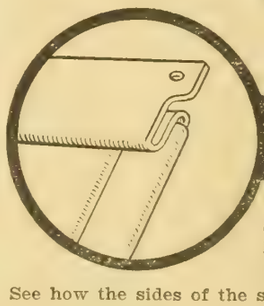
Preston Steel Shingles are safe-locked on all four sides



TOP LOCK

You can only get the safe-lock construction in PRESTON Safe-Lock Shingles.

Look at picture of our side lock. See how the sides of the shingles hook over each other. This is on the principle of the sailor's grip. It is utterly impossible for shingles locked in this way to pull apart. The heavier the strain the firmer the grip.

The top of a shingle is where the greatest strain falls. Now look at our top lock. It is twice as strong as our wonderfully secure side lock. Notice that it consists of three thicknesses of sheet steel. The top of our shingle is unaffected by strains due to settling of building or shrinking of sheeting.

PRESTON Safe-Lock Shingles are proof against rain, snow, wind, frost and lightning. The only way to get PRESTON Safe-Lock Shingles off the roof is to remove the nails one by one and unlock each shingle separately. When you put PRESTON Shingles on your roof they are on to stay.

PRESTON Safe-Lock Shingles are the only shingles made and galvanized according to British Government Specifications. Shingles galvanized according to these specifications are good for twice the service of shingles galvanized in the ordinary way. They are also the only shingles with a Free Lightning Guarantee.

Send today for our free booklet "Truth About Roofing." We did intend to charge something for this booklet. But we will send it free as a reward to all who cut out, fill in and mail the coupon to us. Do it right now. 5

The Foolishness of it

Spending hundreds of dollars in building a splendid home or barn and then deliberately allow it to suffer for paint.

Martin-Senour Paint

100% Pure, Preserves

It feeds the hungry open pores of the wood with pure linseed oil, lead and zinc—making the surface absolutely impervious to climatic changes.

It seals wood from dampness—prevents it from splitting, cracking, from sun and frost, blistering heat and blowing dust, which help the processes of decay and ruin. Good pure paint buys more than 100 cents worth of insurance against the ravages of time.

The ingredients of a pure paint are well known. In the main they are Carbonate of Lead, Oxide of Zinc pure Colors, well ground by specially adapted machinery, and thinned with pure linseed oil and pure turpentine dryer.

A building owner who fails to recognize *the great importance of selecting the right paint*, will see his property value decrease while he grows aged and peevish wondering why.

Notify us if your dealer cannot supply you, we'll gladly direct you where our paints can be had.

Montreal
Pioneers Pure Paint

healthy ones, thereby reducing their actual value.

If all of the tubercular cattle in the United States were slaughtered at once, the balance of the cattle would be worth more than the tubercular and healthy animals together.

It is every man's duty, in justice to himself, to determine positively that his herd is free from tuberculosis. Wiping tuberculosis out of the cattle of this country is too large a problem for a handful of people to undertake and for this reason I contend that we will never wipe tuberculosis out of the cattle of our country until the live stock owners are given the proper information, both concerning the nature of bovine tuberculosis and the tuberculin test. When this information reaches the live stock owner, I am sure that he will be more anxious to wipe tuberculosis out of his herd than any one else, owing to the fact that he is financially interested and he and his family first of all are consumers of the products of his cattle.

Supposing those who do not believe that there is such a thing as bovine tuberculosis or a reliable tuberculin test apply this simple, harmless test to their herd and if they find that there are animals in their herd that have reacted to the test, have such animals placed in one stable and those that passed the test, indicating that they are free from tuberculosis placed in another stable, keeping for their own use the product of the ones that have reacted and pronounced tubercular, and putting upon the market the products of those that have according to this test passed and found free from tuberculosis.

Live stock breeders, think this over carefully and be fair with yourself.

DR. DAVID ROBERTS.

A New Idea

In the West Indies people who have long worn cotton and linen clothing in the hot weather, are now using pure wool homespuns and find them most agreeable. The Hewson woolen people of Amherst, N. S., are developing this trade very successfully. Canadians might do well to wear more homespuns in Summer.

Your old Carpets will make you handsome Rugs. Write for booklet mailed free.—THE MARITIME RUG WORKS, St. John, N. B

Definite Gains From Cow Testing.

Editor Maritime Farmer:—

Mr. A. W. Haine, of Dewdney, B. C., writes as follows:—

"When we joined the cow testing association in 1908 we had 21 cows, aged between 4 and 7 years, with an average yield of 6,800 pound milk. In 1909 our 21 cows averaged 8,360 pounds milk. We have 16 pure breds and 5 grade Holsteins. I would not think of stopping weighing and testing our milk as I feel satisfied that if a dairyman looks well to the sire of his herd, and weighs and tests, his herd is bound to improve, and the hired men take more interest in their work. We commenced dairying 8 years ago with the intention of bringing our cows up to an average of 6,000 pounds milk each, which we did in about five years."

Such statements as the foregoing should prove inspiring to every dairyman. A fairly high standard of 6,000 pounds milk was reached in 5 years, and an increase of 23 per cent. has been added to that. Mr. Haine will probably be up to 10,000 pounds per cow soon. That is one particularly interesting feature of cow testing, ideals are realized, then those still higher are sought for, again with satisfactory results. What excellent herds could be developed if dairymen all over the Dominion would take up cow testing in real earnest.

C. F. W.

1. A cow's return for kindness is profit; for abuse, loss.

2. You have no more right to abuse the cow than she has to kick you.

3. When you go to milk the cows with a club in one hand and a milk pail in the other, you'll come back with little in the pail.

4. You cannot get more butter fat in the milk by pounding the cow over the back with the milking stool.

5. If after you kick the cow, she kicks you, thank her. It is simply a reminder that you have a bad habit, and, worse still, you are teaching the cow a bad habit.

6. As a general rule, when you see a cow kick, make up your mind that someone kicked or struck her first.

7. When the owner passes behind his cows in the barn and the animals fly first to one side of the stall, then to the other, with a wild blue glint in their eyes, make up your mind that the poor animals think that he is only another species of dog.

8. When you see a man step in between his cows to milk them and roughly shove the animal over to the other side of the stall with the yell "Get over, can't you," just watch the cow wind him one across the ear with her tail, and it serves him right.

FORESIGHT

Means Provident Care for the Future.

Is it FORESIGHT to WASTE money on a FLIMSY CREAM SEPARATOR because it is a LITTLE LOWER in PRICE? It may skim for a SHORT TIME, soon GETS OUT of REPAIR and is READY for the SCRAP HEAP in a YEAR OR TWO.

"Care for the future," means, select the STRONGLY BUILT MAGNET made by the CREAM SEPARATOR SPECIALISTS, the

PETRIE MFG. CO., Ltd., Hamilton,

whose GREAT SUCCESS has been attained by building this Cream Separator superior in every way to all other separators.

DO NOT TAKE our word for it, BUT COMPARE it, point by POINT, with any or all separators and you will find EACH PART in the MAGNET STRONGER and BETTER ADAPTED for doing the WORK FOR YEARS than the parts IN ANY OF THE OTHERS.

Here are the points :—

1st The square gear construction.
2nd The strong and rigid frame.
3rd. The double supported bowl. (MAGNET Patent.)
4th. The skimmer in one piece takes out all foreige matter leaving perfectly pure cream.
5th. Perfect skimming, the advertised capacity.
6th. Easy cleaning, clean within five minutes.
7th. Change of capacity in the same stand for a few dollars.
8th. Perfect brake. Saves time. (MAGNET Patent.)
9th Sanitary strainer on tank. (MAGNET Patent.)
10th. Safety. All parts covered
11th. Skims standing on the ground or any floor.

Our GUARANTEE COVERS EACH and EVERY POINT. Send for Catalogue.

Free to every Dairyman. Department E, under the management of a Graduate, will answer all inquiries in regard to Dairying, free.

Our 12 years' experience, as Dairy Specialists, is at your disposal.

Dairy Notes

Few farmers realize what it costs to be rough with cows.

Make a test and be convinced. Use the Babcock test when the cows are handled quietly and properly, and again when they are yelled at and hurried to the stable.

The loss following rough treatment will astonish most farmers.

A careful milker, quiet in his ways about the stable, is worth many dollars more in a single season than one who is brutal.

There is not a cow, no matter how poorly bred, that will not respond to kind treatment.

The more highly bred she is the more susceptible she is to these influences.

Stinting in the feed will never bring full production and profit.

Never allow a harsh, unfeeling man in the cow barn. It is not possible to give a cow too much care.

Profitable dairying depends largely upon getting cows to eat large quantities of feed.

To do this the feed must be palatable and healthful.

Clean the stables two or three times a day. Try it and see how much better the air will be.

Wall whitewashed stables look cleaner, brighter, and are more healthful than those that are neglected.

A close, poorly ventilated stable may be very cold. It takes plenty of pure air to keep cattle warm.

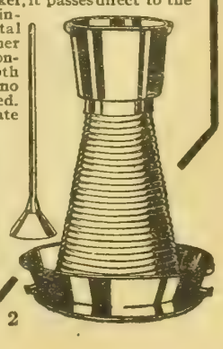
By all means the best way of getting dirt out of milk is never to let it in.

MAKE DAIRYING PAY BETTER

Strain your milk as it leaves the cow, not afterwards, and see that you strain milk only, not milk, dirt and bacteria. You can make pure milk an absolute certainty by using the

STERILAC SANITARY MILK PAIL

Note its clever construction. The funnel is detachable. As the milk falls on the slant towards the milker, it passes direct to the strainer into the pail. All dirt falling into the opening is caught on a deep metal shelf inside the funnel—not on the strainer—thus milk and dirt never come in contact. You can use ordinary cheese-cloth for straining. Capacity 14 quarts, no joints on the inside; it is easily cleaned. Price, $2.50. Used by all up-to-date farmers and dairymen.



PURITY MILK COOLER-AERATOR

Cools milk rapidly, within 2 degrees of running ice water, well or spring water, whichever you use. Rapid cooling and thorough aeration ensures milk keeping sweet for 48 hours and destroys odors. The milk flows through the perforated pail on top on to the corrugated body which ensures the milk running down slowly so that it is perfectly cool when it reaches the retainer pan. There are outlets at each side of this pan. This cooler is well made, has soldered seams, is easy to clean and simple to operate. Will last for years. Price, $6.50. Guaranteed as represented. Write for large catalogue of dairy supplies, FREE.

W. A. DRUMMOND & Co., 185 King St. E., Toronto

THEY THINK You Don't Know

Any one who thinks he can hide from you the fact that disk filled or other common cream separators are complicated and hardest to clean must think you never use your eyes. Any one who tries to convince you that disks or other contraptions are necessary in a modern separator must think you know nothing of facts.

Sharples Dairy Tubular Cream Separators

have neither disks nor other contraptions, yet produce at least twice the skimming force, skim at least twice as clean, wash many times easier, and wear a good many years longer than common, complicated separators.

That is why farmers all over the world call Tubulars "The World's Best", and it explains why Tubular sales exceed most, if not all, others combined and why Tubulars probably replace more common separators than any one maker of such machines sells. The manufacture of Tubulars is one of Canada's leading industries. Write for Catalogue No. 194

LIVE STOCK.

Bulls Running at Large.

Farmers who are trying to build up a herd of cattle and who live in districts where bulls are allowed to run at large are beginning to complain seriously. At almost every farmers' gathering in Canada resolutions are passed memorializing the Government to restrict the territory in which entire animals may be allowed to roam.

This action on the part of the farmers is indicative of two things. In the first place, it shows that there is a desire to breed up the cattle stock, and this cannot be done when every scrub bull in the district is allowed to run with the cows. It is manifestly true that, no matter how good the cows nor how good the farmer's own bull is, if his neighbor's scrub bull, or a bull of some entirely different breed, is allowed to serve his cows, his effort at improvement will be in vain. And then a farmer may have his cows enclosed within a pasture fence, which will not stand very long if a bull on the outside wants to get in. This desire for improvement is behind these resolutions for restricting the range of bulls.

This complaining also shows that there is a large element that are not giving much attention to their bulls and the improvement of their stock, else these bulls would not be running out. Of course this does not apply to strictly range conditions, for there it is necessary that the bulls be on the open range during part of the year. It is the farmer with the scrub bull that is not so particular whether the brute is kept in or not. But whoever saw a farmer that had a number one bull and let him run out to serve all his neighbor's cows for nothing? It is the poor bull that is being objected to all the way around, and it is the careless farmer who is letting him out and causing the trouble.

Now there is another feature about this bull business that is worthy of consideration. So long as bulls are given free range, just so long is it going to be impossible to eradicate contagious abortion. A little miserable scrub bull roaming around from one herd of cows to another can do more harm in spreading this highly contagious disease than all the good the whole force of government veterinarians can do in a much longer time. It is doubtful if abortion ever can be stamped out so long as bulls run at large.

In a great many districts there is considerable dairying carried on and consequently quite a few dairy bulls. The beef man hates these bulls like poison and for very good reasons. There is no reason under the sun why dairy bulls should be allowed out loose at all. The cows must be brought home to milk, and it is an easy matter to see when the bull is needed. A dairy bull is a prime essential in the dairy herd, but he is worse than useless for breeding up beef stock. There can be no excuse for letting such run at large.

It seems most unjust to hinder a farmer from improving his stock if he wants to do so, but that is what is being done when bulls are allowed uncontrolled range. The demand for an amended Entire Animals Ordinance is in keeping with the improvement in conditions generally.—N. W. Farmer.

Pure Bred Sire—His Value.

Following is a portion of an information circular recently sent out by the Blue Valley Creamery Co., to its patrons:

How many of you have dairy herds that will average more butter fat per cow than your father's herd did, or perhaps than did your grandfather's herd? Have you made any improvement upon your father's methods of handling his dairy herd? Are you taking any steps to insure the heifer calves you are raising being better milk and butter producers than their dams? If you are using a "scrub" or a "beef bred" sire and hoping to have a herd of profitable dairy cows, your results will certainly not be very gratifying.

The task of building up a profitable dairy herd must begin with the sire. Without a pure bred sire, with the ability to get calves capable of producing milk and butter fat economically, all other efforts to improve your dairy herd must fail. The skillful breeder of any class of live stock realizes the importance of having a properly selected sire to head his herd. The average dairyman, however, gives this important subject little thought and makes use of a scrub sire because of the idea that it is cheaper to do so, or because his father got along all right with a scrub sire and he, himself, has not given the matter much thought. The scrub sire and the unprofitable cow go hand in hand in retarding dairy progress; where you find one you generally find the other. It is not necessary that every farmer have pure bred cows of a dairy breed in order to have a profitable dairy herd for high grades are just as efficient producers.

The following shows very distinctly the rapidity with which the qualities of the sire accumulate in the high grade:

Generation	Blood	Percent. Improved	Percent Unimproved
1	½	50.	50.
2	¾	75.	25
3	7-8	87.5	12.5
4	15-16	93.75	6.25
5	31-32	96.87	3.12
6	63-64	98.43	1.56

This shows very well the truth of the often heard statement, "The sire is one-half the herd." It does

CAPACITY---DOLLARS !

A VITAL POINT FOR THE PROSPECTIVE BUYER.

To clearly illustrate this important question :—

To separate 100 lbs. milk (10 gals.) with a 350 lb. capacity separator, you must operate it about 20 minutes.

To do the same work on a 500 lb. capacity separator it takes but 12 minutes.

You Save 8 Minutes

in time? Yes, but that's not all. In wear? THAT'S IT. Eight minutes in wear every time you separate 10 gallons of milk.

The Capital

is small in appearance alongside of other makes of EQUAL CAPACITY because of its simple yet strong construction and its "easy to wash" bowl, separating 500 lbs. of milk per hour. Weighs less than four lbs.

That's Why.

The National Mfg. Co., Limited,

The Original "HALLOCK" Weeder.

The object of a weeder is to keep down the weeds, therefore, it resolves itself into this one fact: that a weeder should be used early and often, so as not to give the weeds a chance to grow. You will not injure your crops by working the ground directly over the plant or grain, but will do much toward increasing the growth and yield.

You can work them in dry or wet weather, they will not cut the roots of the crop, but cultivate just deep enough to retain the moisture just where it is needed. But, do not forget the old rule—Use the WEEDER early and often, and when you are all through with all kinds of other cultivators, our weeder will finish your job in No. 1 shape. Thousands in use. Write for prices and terms.

Send in your order now for the "HALLOCK" Weeder. Goods are now in hand, all orders will receive prompt attention.

not mean, however, that the same sire must be used throughout the six generations. This illustration is true whether or not a change in the sire is made. With the properly selected pure bred sire used on the common cows found in the average herd, the improvement will be much more rapid and the sire will be a great deal more than one-half the herd. His being pure bred gives him greater power to stamp his characteristics upon the offspring than can the grade cow.

Up-to-date dairymen are beginning to realize the value of pure bred sires in increasing the production of the herd and decreasing the cost of producing butter fat. Do not be afraid to pay a good price for a pure bred sire to head your herd and never buy a sire because the cost in dollars and cents is low, for you will surely realize some day that his actual cost was indeed very great. If he is a sire that will produce daughters that have milking qualities developed to a high degree, the cost should be of secondary importance.

Valuable information as to the importance of the sire in improving or injuring the productive capacity of the herd can be had from a study of the dairy records of the State Agricultural College of Missouri.

By comparing 10 daughters of a sire with their dams, it was determined to what an extent these daughters were influenced by their sire, that is, whether or not they were superior producers to their dams. It was found that 10 daughters of one sire averaged 216 pounds of butter fat yearly; while their dams average 234 pounds yearly. It can readily be seen that this bull decreased the average production of the daughters 18 pounds under that of their dams. With another sire that was used there was no decrease or increase, the herd being at a standstill. Another sire which was used increased the average production of 10 daughters 110 pounds of butter fat per cow over that of their dams. This 110 pounds of butter fat at an average price of 25 cents a pound, would make $27.50 that each daughter earned in excess of the earnings of her dam. Counting on the same basis 30 cows milked six years, we have $4,950 worth of butter fat produced by the daughters in excess of that produced by the dams. You can readily see what the great value of this bull would have been had he been owned by a small association of neighboring patrons. He would have been cheap at $1,000, while the other two bulls mentioned would have been expensive at $10.00 because they left the herd in a worse condition than they found it. There is no question but what many farmers are lowering the productive capacity of their herds every generation on account of their paying no attention to the selection of sires.

Investigations carried on in some Indiana herds by the Indiana Experiment Station showed that herds in which pure bred sires were used were producing butter fat on an average of 3¾ cents cheaper than herds which were ungraded. While the average profit per year from the ungraded herd was $19.62 a cow, that of the graded herd was $36.04 a cow. On a average the graded herd produced 64 pounds of butter fat per cow more than the ungraded herd. There is no question but that the purchase of a pure bred sire would be one of the best investments our patrons could make.

The Cow Due to Freshen.

It is not an uncommon occurrence to neglect the cow which is due to freshen, whereas if proper attention was given her up to this time, she should produce exceptional results. Give her sufficient and proper feed as this will encourage the development of a large udder.

A swollen udder after freshening would indicate that she is a good cow, because it is the large flow of milk which causes the distention of the udder. It is at this period that the average stock owner is apt to err in allowing the calf to nurse its mother, owint to the fact that the calf has a tendency while nursing to bunt the udder, thus causing increased irritation.

Too much stress cannot be laid upon the importance of caring for the udder, it being advisable to apply soothing applications in case same is unnaturally swollen or caked.

A mild tonic is often advisable where there is an unnatural swelling of the udder as it has a better effect than outward applications.

DR. DAVID ROBERTS.

There is hardly a farmer's daughter in Canada who does not know Windsor Salt.

It has been the universal standby for years.

Practically all the prize winners at the fairs have used Windsor Salt—last year, 95% of those winning cash, medals and premiums, made their prize butter with Windsor Salt.

If you have not been using Windsor Salt for butter making, get a sack and try it. You will then see why the prize butter makers use it.

7

Abnormal Appetite.

Cattle with abnormal appetites have a strong desire to lick the walls, dirt and filth that a healthy animal would have no desire for. This would indicate a derangement of the digestive organs.

If animals thus afflicted are neglected they will soon run down in flesh, drop off on their milk, and become a bill of expense rather than a profitable animal.

To overcome this trouble the animal should be given good, clean, nutritious, digestible feed and with same a tonic to regulate the digestive organs.

Oftentimes an animal thus afflicted is disposed of at an unreasonable small amount and if by chance this animal is purchased by one well versed in the care and treatment of such animals, is converted into a profitable animal at a very little expense.

THE HORSE.

Care of the Horse.

The horse is not only better housed, which has reduced the frequency of respiratory complaints, but he is better fed than formerly. There is still room for improvement—that is, room for better management—because preventable diseases associated with bad or injudicious feeding are still of too frequent occurrence. A lavish adundance or niggardly parsimony in kind or quality of the ailment may be equally bad management. Broken wind, which is most common among farm horses and ponies (both classes of horses the property of notoriously poor feeders), is invariably caused by feeding large quantities of coarse, innutritious, and badly saved hay, or permitting horses to eat their litter. To the unobservant or inexperienced there may appear but little connection between broken wind and inferior food, but there is no bettr way of causing this distressing and incurable complaint than by permitting the animal to take its fill of mouldy or dusty hay, or by habitually feeding it largely on such stuff. Feeding without reference to the nutritious value of the food or its quality, and supposing that when inferior stuff is used deficiences can be compensated for by an extra allowance, will be sure to end disastrously. If farm horses had more corn and less hay, especially inferior or badly-saved hay—which is frequently reserved for consumption by the team, while the better quality goes to market—there should be fewer broken-winded subjects among them. Laminitis — inflammation or "fever in the feet"—once very common, and still frequent in some stables, is invariably associated with dietic errors, particularly with the use of wheat, and, to a more limited extent, of barley as a grain food for horses. There are, of course, other causes, including long spells of idleness in the stable, over driving horses out of condition, and injudicious paring of the feet; but too much grain, and not enough work, both instances of bad management, are the most fertile cause.

WATERING.

Watering is closely associated with feeding; indeed, it forms part of any system of dieting. A restricted allowance of water is a fertile cause of impaction in horses fed on dry food. We have known it to be frequent in stables where water for the horses had to be carried from a distance, the attendance making one bucket do for two horses when they ought to be getting one each. It is by far the best plan to have water always standing in front of the horse, of which it can drink at will, but it must be kept clean and frequently changed. Horses so provided drink relatively less than those watered at irregular intervals. If there are insuperable objections to this plan, then water should always be offered previous to feeding, and the horse premitted to satisfy his requirements. Some horses play with water standing in front of them, and always have their surroundings saturated, and unless the supply and discharge are automatic, there is often negligence on the part of attendants to keep a clean supply. The quantity of water supplied to horses is of some importance, owing to its effect on the digestive and urinary organs. Cold spring water, which is often hard, is not the best for horses, who exhibit a marked preference for pond water, which has been softened and warmed by exposure to the atmosphere. Much depends upon what the horse has been used to, but, taken generally. hard water is bad. That the character of the water supplies has a great influence on the health and condition of horses is well understood—so well, indeed, that trainers of race-horses often go to the trouble and expense of carrying with them, to places where their charges are to run, the water to which they have been accustomed at home. Horses have no particular preference for dirty water, or for that from a pond receiving the drainage of the farmyard and buildings: but they like soft water Water from a clean pond, or well-stored rain water, is decidedly preferable to cold spring water, and horses supplied with the softer fluid look much better in their coats than those getting hard water. If the supply for the stable is from a deep well or underground pipes, the water, especially in summer, should be drawn and exposed to the atmosphere for some time before it is offered.

GROOMING.

In the mind of the stableman, grooming is inseparably associated with appearances. It serves purpose of much greater importance, so far as the health and efficiency of the animal is concerned. It stimulates the skin, removes dead hair, and also the dust and debris that would choke the pores of the skin and interfere with cutaneous respiration. The "grease" in the coat of the horse that is running out and feeding on grass serves a useful purpose in affording protection, and it is a good plan to refrain from grooming for several days the horse that is to be turned out; but the stabled and highly corn-fed animal needs grooming and plenty of it, to keep it in health and condition. Some diseases of the skin of the extremities—notably mud-fever, cracked heels and grease—have an intimate connection with stable management, and are invariably associated with the close clipping of the legs in winter and washing them on return from work and leaving them wet. These troubles are best avoided by clipping Irish or hunting fashion, and adopting the dry system of cleaning now practised in the best hunting stables.

Treatment for Balky Horses.

One of the most trying experiences in the training industry is to have a horse balk when asked to move a load well within his ability, says the Horseman. A horse that possesses a balky temperament is never safe in emergency, and the driver is always anticipating trouble with his charge. The incorrigible balky horses of the rural districts find their way to wholesale markets, where, under the test of hauling a heavy truck wagon on a paved street, with the wheels blocked, the vice is immediately discovered. If the animal has been sold as serviceably sound, and guaranteed a willing worker and cheerful puller, the buyer rejects his purchase and the horse is re-sold without any guarantee except clear title of ownership. Some horses have learned to balk by being overloaded and abused. Their courage has been overtaxed and they rebel disheartened at the task they are asked to perform. Other horses appear to balk from natural inclination and appear foaled full of innate stubborness. Balking, like wind-sucking, cribbing, weaving and halter pulling, is a vice developed by natural inheritance. In breaking young horses to harness too much caution cannot be observed in asking the youngster to pull light loads to begin with. Balkiness is an attribute of equine meanness that when it manifests itself is sure to appeal to the evil disposition of the teamster. To know that a horse is well, has been humanely treated, and is only asked to perform that which he can do easily and have him refuse to do it naturally incites a driver to punish the animal. Beating a balky horse does not appear to reform him from the vice, When exhibiting a demonstration of his balky disposition, the horse appears to be immune from the pain of punishment and stands beating without flinching. The animal appears to be under the influence of a spell, in which he would rather die than obey the voice of his master. The balky horse cannot be conquered by brutal treatment, but may be induced to pull by many devices intended to attract his attention from his resolution not to pull. To lift the forefoot and pound on the shoe, to put a handful of grass or dirt in his mouth, to give him a lump of sugar or an apple to eat have all proved successful in some instances in inducing a horse to pull. To pass a cord around the pastern and pull the forefoot forward until the animal has to move is also a means of starting a balky horse. An electric battery manipulated by the driver gives an animal a shock from a source that he does not comprehend and is the latest device in treating incorrigible horses.

In buying a horse always select one that appears intelligent and tractable. The "mean, ornery-looking cuss" is generally just as mean and "ornery" as he looks.

It would be an excellent thing if the idle stallion were hitched up and used to haul wood or wheat. The ideal way to treat a stallion out of service is to put him in harness and work him at ordinary work daily, and feed him as a work horse. The stud horse in this country is treated too much like the rich man's sons, too much indulgence and idleness for their own physical good. Both would be better for a little work.

North Dakota has a new stallion enrollment law. We have not seen it in full, but it demands that all parties standing or using stallions in that state for public service shall have the same registered by the newly created stallion registration board at the Agricultural College. All stallions must undergo a veterinary examination by an inspector appointed by the board. We would suggest that our own horse breeders' associations secure copies of this new law and see if there are any good ideas in it that we could adopt.

A Strong, Stay-Tight Connection Where Other Mowers are Weak

Seventy years' experience, plus a disposition to use the very best materials when it might seem more profitable to cheapen things, is why Frost & Wood Implements excel from the "Quality" standpoint.

Take, for instance, the connection between the Cutter Bar and Main Frame of a Mower. Others use Small Pins, that wear quickly, thereby allowing connection to work loose, and eventually "bang" the machine into a blacksmith shop. We use "large" Bearings for our "stay-tight" connection (see illustration). They fit accurately and there is no opportunity for wear, because Cutter Bar has no chance to work loose from Main Frame. No time lost on the field—no bills to foot.

Another example of Frost & Wood "Quality" is the Pitman Connection of Forged Steel and "the Ball and Socket Joint"—strongest, firmest connection on the market.

Roller Bearings, with heavy boxes to maintain them in perfect position, make the No. 8 run easier than others. Every connection is neat and accurate. The "Internal Gear" cuts out the necessity of a "flying start"—knives commence cutting with first forward step of horses.

The No. 8 Mower and its companion, the Tiger Rake, are on the top-most rung of the "Quality" ladder.

POULTRY.

Summer Egg Production.

We have been accustomed in the past to look upon egg production in the winter time as the most important feature of the egg business, but now the high price of eggs and the increasing demand for the same causes us to turn our attention to other periods of the year.

Egg production throughout the year might be plotted in a curve. It starts low down in November and December, rises to its height in March and April, in the natural hatching season, and falls off gradually throughout July and August until it practically ceases in the latter part of September and October. The only way to overcome the deficiency in the fall seems to be by the hatching of very early pullets. This is not practical for the farmer. He can, however, improve production in the summer and in the following lines we will endeavor to show how:

FIRST—THE STOCK.

Of course, we desire to have pure-bred stock. There is no excuse for anyone keeping a mongrel flock at the present time. The question of stock is not quite so important for summer work as it is for winter work, yet it is important. For the latter it is absolutely necessary that we have early hatched, fully matured stock, but for the former much of that stock that was not mature enough for winter work will be available for summer work. It does not as a rule keep it over, yet there is much of it in the country.

SECOND—THE HOUSES.

In the early days the hens roosted outside in the trees and laid when and where they pleased. We must provide them with light, airy, clean, well ventilated quarters. The curtain front house does this if properly tended. In the south it is often the custom to remove the roosts from the back to the front when the warm weather comes on, or a series of double roosts may be provided allowing the hens to choose for themselves.

The most important feature in summer egg production is cleanliness In many, many instances it is the presence of filth, insects, and disease that drives the hens out of doors. The houses must be kept clean and cool. The droppings must be cleaned out regularly and the litter must not be allowed to become damp and sour. Dropping boards should not be used unless they can be cleaned off every day. Where no dropping board is used, cleaning twice a week will do but oftener would be better. It is a good plan to scatter clean, fresh soil around where the droppings will fall, for soil is an excellent deodoeizer and disinfectant. When allowed to remain too long the accumulated droppings dry out and become excellent breeding places for lice and mites.

The litter on the floor is of importance. Straw or marsh hay may be used and should be used if it can be readily procured, but it becomes dirty quickly. Some use shavings or soil, but these are not very satisfactory if it is intended that the grain be fed inside. The house should be whitewashed. It makes the house much brighter, and light is one of the best disinfectants we have. Some object to the dust, but the dust is what is wanted. Lice and mites breathe through pores in their skin, and the most effectual way to combat them is to clog up those pores with dust, oil, etc. This is why whitewash is used on the walls and the oily disinfectants on the roosts and nests.

The drinking utensils, the troughs, the hoppers, the nests should all be kept clean. The nests must be cleaned from time to time and plenty of clean, fresh hay or straw added. Much profit is lost to the farmer by having dirty nests. The hens refuse to lay in them, the eggs are lost. With no litter in the nest many eggs are cracked or broken, their contents smeared over other eggs, and the nest material made foul and dirty. Such will taint the eggs every time and load them with bacteria which cause early decay.

THIRD—THE FEED.

The question of the feed is important. The amount of corn in the ration should be reduced in warmer weather. More wheat and oats may be used, preferably a little of both if market prices will allow. The hard grains may be fed on a clean piece of ground outside. Some continue to feed in the litter in the summer, which is good if the hens are closely yarded.

A dry mash should also be placed before them. It may be hopper fed and good results obtained. It may consist of varying amounts of several ingredients, but one composed of the following will give very fair results: 2 parts bran, 1 part corn meal, 1 part middlings, ½ to 1 part linseed meal, and 1 of beef scrap. It is well also to supplement the dry mash with an occasional wet mash, say from two to three times a week. A meat mash made thus: Boil some cheap meat till it is well broken up; take an ordinary 12 quart pail, place in it about 2 quarts of corn meal, pour the boiling liquid slowly over it. Stir till the meal has taken up all the moisture it can, then add about 3 quarts of bran and stir. It may take more in which case add bran until the whole has a consistency of brittle dough. If the birds have free range (and it is preferable that they should, for no one can get the best results from a bare yard), the use of beef scrap and green food will not be so necessary. If the birds are yarded some provision must be made for green food. Rape is very useful for this. If handled carefully and only the outer leaves removed, it will stay green and succulent for a considerable length of time. As a rule it is wise to supply birds with some shell forming material and grit even throughout the summer months. If they do not need it, they will not eat it.

The birds must have water. Watering once in every two or three days will not do. They must be watered daily with good fresh water placed in clean dishes. The dishes are apt to become slimy and ill-smelling. They should be scalded and rinsed out from time to time. The place where the water pail is set is important. It should not be set in a house where all sorts of dirt will fall in. It should not be placed in the sun where the water will become hot. The birds like a cool refreshing drink as well as a man, and the water should be placed in a cool, shady place.

FOURTH—SHADE.

Birds do enjoy a shady place in summer under the trees, in a raspberry patch, in an asparagus patch, or in the corn. They seem to enjoy a low thick shade the best, and if it is convenient either their house should be moved to the shade or the shade should be brought to them by planting the above mentioned crops.

Some one will say, yes, if we do this our birds will lay in such a place. They will not lay any quantity there if one provides proper quarters within doors. A clean, cool house, well ventilated, free from lice and mites, darkened nests with clean fresh litter in them, broody hens removed and shut up (nothing breeds lice so fast as a bunch of broody stuff, fresh water in clean dishes, and hens continually sitting on the nests), plenty of cooling food, range and green, a nice cool, convenient shady nook in which to spend the hot parts of the day. If people will but do this, take pains and have a sympathetic interest in those fowls, gather the eggs regularly, discard the cracked and dirty ones, keep the eggs in a cool, sweet place and market them often, they will get more eggs, they will get better prices, their eggs will become known in the community as pure, fresh and as germless as it is possible for them to be.—Professor W. A. Brown, University of Maine.

The poultry house should be frequently cleaned. The dropping boards should be sanitary and the hay or straw used to line the nests should be frequently changed.

Don't breed from any hen, duck, turkey or goose which has ever been seriously sick, even though it may seem to have recovered.

Nothing worries a sitting hen so much as lice, and she should be dusted once every week with some lice killing powder to kill the pests. In so doing, be sure that her plumage is filled to the skin.

There are many breeds and all have their merits. He has the best breed who gives it the best care and aims to secure the most good out of it. Feed, in this particular, has a great deal to do with success.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Unruly Member.

BY MARION HARLAND.

(Continued from lastissue.)

"Had you addressed your dissuasions to me, sir, my course might have been very different," replied Horace, with a searching glance at Cora. "I acted upon the impression that I had your cordial approval of my venture, and this mistake led me to greater lengths than I originally purposed."

"It was a mistake, and a singular one," said Mr. Manning. "Why, Cora, you—where has the child gone? I was about to say that she could have set you right on that head. There is no use lamenting over what is done and cannot be remedied. I am an intruder here, tonight, to say to you, my dear fellow, that my confidence in you remains unshaken—that I have not even the charge of imprudence to bring against you. You were a little precipitate, but that is of no consequence. Men of twice your years and experience commit greater blunders, are guilty of greater rashness every day." Here the old gentleman began to stammer and look embarrassed. "And furthermore, Horace, if you do not get well out of this quagmire, if all that you have goes by the board, I stand ready and able to help you to regain your place—an honorable one it is, too—in the mercantile world. Moreover" —hesitating yet more woefully— "don't make yourself wretched—that is, unhappy; I mean uncomfortable—with fancying any alteration in certain arrangements. You understand? I commenced life—my married life, ahem?—when I was pretty near the foot of the ladder. It's by far the best way."

This was a long speech for worthy Mr. Manning, yet Horace had no language, at its close, with which to thank him. Deeply affected, he wrung his hand, and his moistened eye and quivering lip told of gratitude too great to be articulate.

When Cora re-entered the room, he was alone and more composed. Into her ear he poured his acknowledgements to and praises of her father.

"But how strangely you misconceived his sentiments touching this luckless business!" he remarked, presently. "They appear to have been exactly the reverse of what you understood. How do you account for this?"

"Either I was dull or so perverse in my ideas of the subject that I did not and would not comprehend, or he is forgetful," answered Cora, readily.

And this was the woman who, not two months previous, had avowed so proudly, "To him, at least, I am no dissembler!" The broad, shallow steps of harmless evasion, unimportant exaggeration, and pardonable equivocation had prepared her slowly, but how surely, for sudden and deeper plunges into falsehood. The Father of lies appreciated his tool, and was master of his art. Horace had not the meagre satisfaction of knowing how full and remorseful was her participation in the trial of feeling and threatening of pecuniary loss that oppressed him. He saw that she suffered, and from some cause beyond his power to cure; and this begot in him additional care at a season when his uneasiness was already sufficient to crush the spirits and energy of an ordinary man.

While matters were in this state, he had a call from Dr. Merrill. This devoted man of medicine rarely stepped aside from the routine of professional life, unless incited to the extraordinary measure by business of an urgent nature. Upon this occasion, before seating himself, he broached the subject of his errand. Horace's amazement was profound when the theme was prefaced by his sister's name, and it grew apace when he discovered that a serious complaint was entered and sustained against one whom he had ever regarded as a model of discretion. But as the recital proceeded, he perceived, from his prior knowledge of the circumstances, that, if she had spoken more freely than was altogether consistent with prudence, she had said nothing unadvisedly. The Doctor's charge was to this effect: that Miss Miller had stated and reiterated publicly, as a fact, his ignorance of Constance Remer's danger, when every labored breath was throwing out the death-dew upon her brow; had reassured her friends, and, through them, the doomed patient, when they expressed solicitude at the result of her sickness; had allowed her to pass into the eternal world unaware, and without the last mournful privilege of saying "Farewell" to those who would always lament her silent departure.

"Now, sir," concluded the irate physician, "I never said that the girl would probably recover. I have not practised medicine—with some indifferent skill, as even my enemies grant—for twenty-five years, not to know consumption when I have to deal with it, hydra-headed though it be. I gave up all hope of the case in point before I had paid half a dozen visits at Mr. Remer's. You do not require to be told how far short I should have fallen of my duty, if I had openly proclaimed my conviction, and advised the parents not to waste more money, physic, and pains upon their idol. Until the world is as wise as doctors, we must work on, with what semblance of confidence we can assume, while the vital spark quivers in the body. But do you not see in what a light people will eye the physician who is as much the dupe of appearances as they are themselves? It is a mortal sin in him to mistake the slightest symptom. He ought to foresee the end from the beginning, in the most complicated malady. Is he not paid to do it? I never exchanged a syllable with your sister upon the subject of the deceased illness, nor do I guess who was her authority for the statement she has circulated of my judgment in the case. There was one who could have told her a totally different story, and the evidence of this person I am prepared to adduce at any moment. The afternoon preceding Miss Remer's death, I imparted my impressions—my certainty, rather—of her actual condition to Miss Cora Manning—"

"To whom?" exclaimed Horace starting from his seat. "I beg your pardon! Did you say Miss Manning?"

"I did. Chancing to encounter her on my way home, after the last visit I made Constance's sick chamber, I answered her inquiries as to her friend's health in the most candid style I could command; told her in so many words, that she was near her end; that it would not surprise me if she did not live through the night. She was shocked, of course, so visibly overcome that I had to warn her against betraying her alarm to its object, pointing out the evil effects of such useless revelation at that late hour. She acquiesced in my prudent suggestion and I left her at Mr. Remer's door. It is impossible that she should have forgotten the substance of our conversation. If you demand her evidence, I trust that she is enough my friend to afford it, at my request."

"It is unnecessary—quite superfluous," rejoined Horace, hastily. "I have heard all I want, and more."

Commanding himself by a strenuous effort, he pledged his word for the contradiction, and, if practicable, the suppression of a report so detrimental to the Doctor's professional pride and interests, and they parted amicably.

The wave that tears the breach in the dyke prepares the way for the surge of its mightier and more disastrous successor. Horace still sat over his neglected ledger, his head resting upon his hands, buried in the painful train of thought forced upon him by Dr. Merrill's communication, when a letter was brought to him. As he broke the seal mechanically, another missive fell from within it. He read the first. Gossips are proverbially thick-skinned, or magnanimously indifferent to the pickles they rub against in their quest after the truth, which, we may remark, in passing, is seldom "the whole truth," and still more rarely "nothing but the truth." Miss Healy's sensitive spirit made her an exception to the general law of imperturbability. She "had her feelings," she was fond of saying. Those who were acquainted with her idiosyncrasies hinted that she had her spites also, and that this class of emotions often reached a pitch of virulence and obstinacy exceedingly unbecoming in so public-spirited an individual, the pretended dispassionate benefactress of the community blessed in being her abiding-place. Horace had fairly earned a share in her rancorous recollection. Stung to the quick by his open disdain for her, as exhibited at divers times and in sundry places, especially and most offensively at Mrs. Williams' soiree, the aggrieved spinster had sought through her well-supplied arsenal for an instrument of torture that might suitably avenge her for the indignity offered. His love for his betrothed was his most vulnerable point, and this chimed in well with her inclination, for Cora, albeit several degrees less obnoxious than her lover, was by no means a favorite with this fastidious lady. In Fred Williams she found a not unwilling accessory to her plot of humbling both the haughty Horace and her who had, to the gentleman's notion, displayed inexcusably degenerate taste in receiving the devotion of his rival. The ci-devant beau had, fortunately for the success of their machinations preserved one memento of the juvenile engagement which, the reader may not be astonished to learn, had once existed between himself and Cora Manning. This souvenir, whether accidentally overlooked in the return of letters at Mr. Manning's command, or with-held purposely, was evidence unimpeachable of the fact and the character of said connection. It was nothing less than a letter penned in Cora's own hand, addressed to her boy-gallant, and glowing with all the inconsiderate ardor of a love-lorn maiden in her sixteenth year.

This was the effusion which Horace Miller's burning gaze now scanned; its every line branding with the grossest deceit and direct mendacity the being he had worshipped as near akin to angelic natures. Galling as its phrases of undisguised tenderness were to his proud, delicate spirit, this was as nothing in comparison with the blighting conviction that his idol was the basest clay—one for whom his pity must be mingled with contempt.

"If she had but told me! if she had owned the truth, were it a thousand times more humilating, I would have loved her all the same," he groaned to his sister, that night; "I said to her when I made inquiry about this early folly—for it was only a folly, Ellen—the fanciful dream of a sentimental school-girl. The whole sin was in its concealment, in the premeditated deception of him who hid nothing from her. I have not deserved this at her hands."

Ellen was much moved, but less surprised than her brother; the scales had not fallen so suddenly from her eyes. Feeling that all might as well be told; that the wisest and most merciful policy towards the sufferer was to complete his disenchantment by abundance of testimony, she related her story. To her, the scene in which Cora and Mary Chester had acted such different parts was but the commencement of similar developments, the key to incidents hitherto inexplicable, each illustrative of this heinous defect in the disposition and conduct of the misguided girl.

And thus Cora Manning lost lover and friend, gaining in their place a memory replete with wretchedness and shame unavailing; the blind commiseration of those cognizant of

HER PHYSICIAN ADVISED

Taking Lydia E. Pinkham's Vegetable Compound

Columbus, Ohio.—"I have taken Lydia E. Pinkham's Vegetable Compound during change of life. My doctor told me it was good, and since taking it I feel so much better that I can do all my work again. I think Lydia E. Pinkham's Vegetable Compound a fine remedy for all woman's troubles, and I never forget to tell my friends what it has done for me." —Mrs. E. HANSON, 304 East Long St., Columbus, Ohio.

Another Woman Helped.

Graniteville, Vt.—"I was passing through the Change of Life and suffered from nervousness and other annoying symptoms. Lydia E. Pinkham's Vegetable Compound restored my health and strength, and proved worth mountains of gold to me. For the sake of other suffering women I am willing you should publish my letter."—Mrs. CHARLES BARCLAY, R.F.D., Graniteville, Vt.

Women who are passing through this critical period or who are suffering from any of those distressing ills peculiar to their sex should not lose sight of the fact that for thirty years Lydia E. Pinkham's Vegetable Compound, which is made from roots and herbs, has been the standard remedy for female ills. In almost every community you will find women who have been restored to health by Lydia E. Pinkham's Vegetable Compound.

the punishment, and not the sin; the displeasure and distrust of the few whose esteem she most valued; the lasting reprobation of him concerning whom, and in whose behalf, she had sacrificed more of truth than for any other cause or creature besides. For was it not to screen their loves from the profanation of vulgar remark, that the lie of policy slipped from her tongue ere she was alive to its formation in thought? that she might shine brighter, stand higher in the respect of him and his, was not the tinsel lie of vanity paraded? to spare him a feather's weight of vexation, an atom of added care, had not the lie of affection been earnest and repeated? to escape his anger, to retain his love, was the lie of fright a whit less plausible and convincing than the rest? Truly, her labors had been neither few nor small, and here was their reward! The fly in the ointment had fulfilled its mission, and the once exulting possessor of the precious casket flung it from him with sorrowful loathing.

Would that the tale were all fiction, or that it treated of the only golden phial thus polluted into a rank offence to those who, in this age of gaudy coloring, and intense refraction, still cherish, as one of the holiest of sentiments, a genuine Heaven-commanding love of TRUTH, for itself and as it is.

THE END.

Jacassa's Journal.

By Mary W. Janvrin.

May 30th.

My name is Jacassa Selina Bowen; I am twenty-four, and unmarried; I am "literary"—that is, I have earned something of a reputation by writing for the magazines and popular light literature of the day. I was worn, physically, by my long winter's toil in the busy city, and I have come down to board and spend a quiet summer in this pleasant seaside, yet country farming-town of Ryefield. I shall not write much here, I opine; rather will I resign myself to the luxurious influences of nature which woo me to a luxurious, dolce far niente sort of laziness, I need as a reaction to the busy, brain-tensioned past. I feel, already, years younger than I did when I came here, and I have been in Ryefield but three weeks yesterday.

There is a positive refreshment in the very air around the farm-house, to say nothing of the quiet comfort of its scrupulously neat interior. The house is old and rambling, but well-kept, and unlike most country houses in general, has a long porch in front, covered with a luxuriant trained honeysuckle; and in the front yard, good Mrs. Hull tells me, by and by will bloom "daffies," and ladies' delight, and "pinnies," and poppies and hollyhocks. The entry is spacious, and the staircase is wide and turns with abrupt angles at every broad stair. On one side, below, is the closed parlor, with shuttered windows, a carpet with "set" figures, a long, wide old-fashioned sofa, a table placed exactly under the gilt-framed looking-glass, between the two front windows, chairs ranged around rather primly, and a mourning-piece and profile hanging the mantel. But I do not sit often in this room, though motherly Mrs. Hull begs me to go where I like and "feel at home," for the closed windows give it a sort of close, musty smell. Instead, I often bring down my sewing, of an afternoon, into the large, sunny, pleasant sitting-room, with its cheerful chintz lounge and comfortable rocking-chairs, its bright homespun carpet, green asparagus-plumes and hemlock-boughs in the fireplace, the tall eight-day clock in the corner, and the polished hun-

Keeps out large Animals—Keeps in the Chickens

We've put strength and stiffness into the PEERLESS JUNIOR Poultry Fence so it can stand the attacks of restless animals from the outside. We have made it close enough so small fowl cannot get through. It is made of much heavier wire than the ordinary poultry fence, well galvanized, therefore much more durable.

Peerless Junior the fence that saves expense

That heavy, No. 9, hard steel wire at top and bottom holds the fence taut and true without the necessity of fence boards and saving more than half the usual number of posts. That means considerable saving to you. Write for our printed matter about PEERLESS Fences. We make fences and gates for every purpose.

BANWELL HOXIE WIRE FENCE CO., Limited
Hamilton, Ont.
Dept. K Winnipeg, Man.

Bruce's Giant White Feeding Beet

Leaders of all tests at the Ontario Agricultural College, Guelph, since their introduction.

These grand Feeding Beets, introduced by us in 1900, combine the fine rich qualities of the sugar beet with the long keeping, large size and heavy cropping qualities of the mangel. The roots are clean and tops small, white flesh, solid, tender and very sweet, and on account of the bigger part of length growing out of the ground they are easily harvested. They will outyield all the other kinds of Sugar Beets and Mangels. The roots are the largest, handsomest, most uniform and cleanest of all Sugar Beets, and this, combined with their great richness and easy harvesting quality, makes them the "beau ideal" of a root for the farm. To show what a grand root we have and how it is capturing the trade, we give our sales—1900, 43 lbs.; 1902, 1954 lbs.; 1905, 4327 lbs.; 1907, 9800 lbs.; 1909, 21421 lbs. We offer in two colors, white and rose, each 1-4 lb., 12c; 1-2 lb., 18c; 1 lb.; 30c, postpaid.

Suffered Terrible Pains

From Her Kidneys For Nine Months.

For Backache, Lame or Weak Back—one of the commonest and most distressing symptoms of kidney inaction, there is no remedy equal to Doan's Kidney Pills for taking out the stitches, twitches and twinges, limbering up the stiff back, and giving perfect comfort.

A medicine that strengthens the kidneys so that they are enabled to extract the poisonous uric acid from the blood and prevent the chief cause of Rheumatism.

Mr. Dougald A. McIsaac, Broad Cove Banks, N.S., writes:—"I was troubled with my kidneys for nine months, and suffered with such terrible pains across the small of my back all the time that I could hardly get around. After taking two boxes of Doan's Kidney Pills I began to feel better, and by the time I had taken three I was completely cured."

Price 50 cents per box, or 3 for $1.25, all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering specify "Doan's."

59 Water Street,

St. John, N. B.

dred-legged table, whereon I had placed a few of my books in addition to the family Bible, "Baxter's Call," and the "New Hampshire Gazetteer," which lay there, and the high mantel-shelf, ornamented with a pair of bright brass candlesticks, and a trio of gayly painted plaster images ranged after a fashion whereof I read once in and old story—"a parrot, a puppet, a shepherdess"—"a parrot, a puppet, a shepherdess."

The long kitchen, extending the whole length of the rear of the house, save the buttery at one end, is a marvel of neatness, from the carefully scoured and sanded threshold of the back door to the red tiled hearth whereon Mrs. Hull stands on baking days, before the open-mouthed, glowing brick oven, to superintend the incomings and outgoings of the great loaves of cake, the batches of pies, and countless drop-cakes which find their way to her bountifully spread table, for my hostess serves me no meagre fare—stale bread, superannuated cake, the "fossil remains" of last week's steak converted into minced pies, nor the beverage yclept coffee faintly colored with feeble chalf-and-water cream, such as one must be content with at city boarding-houses.

Then, my own room is the spare chamber over the closed parlor, and the embodiment of my idea of comfort. To be sure, the smothering bed of live geese-feathers, which I tumbled to the floor, and good Mrs. Hull bore away, after my first night here at the farm, savored of rather too warm a welcome; but the snow-white valance and fresh dainty pillow-slips, the long dimity curtains swaying to and fro in the breeze that comes in through the raised window from the blooming apple-orchard below, the little round table upon which I have laid out my portfolio, writing-desk, and books, and where I am writing now; the great china pitcher crowded with pink and white apple-blossoms, whose fragrance is more delicate than Lubin's vaunted extracts—do not all these bring a vision of rest and comfort to the eyes that have long been used to the crowded city street and high brick-and-mortar walls?

And then, too, away beyond the acres of white bloom in the apple-orchards, beyond the green meadows and the farthest dark belt of forest, I catch a glimpse of the blue sea—the fresh, the beautiful sea that always brings me an inspiration! The sea and the forest! Byron never wrote two truer lines than these:—

"There is a pleasure in the pathless wood,
There is a rapture on the lonely shore!"

I have spent afternoons, in the long bright Maytime, among the woodland paths over yonder, gathering the fragrant pink and white trailing arbutus, the frail wind-flower, the pale anemone, and dark, glossy wintergreen; and often, when Farmer Hull harnesses his black horse for a ride to the vicinity of the beach, I beg for a ride; and while he talks and bargains with the fishermen, I walk along the ehge of the curling breakers, breatning the strong, damp sea air, watching the sea-birds dip their wings in the creamy foam, then stretch away over the waves, or gather white cockle-shells or brown "sailors' rattles" from the bare sand.

"I wish I could live on the beach," I said, the other night, to good Mrs. Hull, as I came home from one of these rides with her husband, standing and holding my hat by the strings, at the dairy door, where she was "setting" the evening's milk. "Yes, I do; I wish I owned a house right there on Boar's Head, where, all night long,

WALL PAPER and Kalsomine are unsanitary. They are ideal breeding grounds for disease germs.

A coat of Alabastine will destroy every disease germ on the wall. Vermin cannot exist on an Alabastined surface. Alabastine is the most sanitary as well as the most artistic and inexpensive wall covering.

It is a cement, and hardens with age. Its colors are permanent and will not rub off. They give that soft, velvety effect, which can only be produced by Alabastine. Anyone can apply it by following directions. A pail, water, and a flat bristled brush are the only necessities.

MESSRS BAIRD & PETERS, St. John, N. B.

OCEAN MILLS, Mount Royal and Lasalle, - Montreal, Que.

stormy nights, I could hear the solemn music of the waves beating against the foot of the cliff."

"I rather guess you'd begin to feel kinder solemn yourself, a-layin' awake two or three sich nights, and be a-beatin' round for some place where you could git a good comfortable night's sleep, Miss Jacassy," good-humoredly said Mr. Hull, who had overheard my remark, coming into the kitchen for supper.

"Oh, I'm sure, Mr. Hull, that the ocean would never weary me," I replied, deprecatingly; "I could listen to its voice forever. You don't know—" But I checked myself there, for I couldn't tell him why I dwelt so constantly on thoughts of the sea. "I shall be sorry when the time comes for me to go back to the crowded city again, never to look upon the sea, save the harbor crowded with ships, never to feel the lonely calm and rest of the quiet sandy beaches."

"Come, come, Miss Jacassy, you you forget mother's nice supper's waitin', and your ride ought to a' gin you a right sharp appetite. As for your goin' back to that stived-up city ag'in, I've my notions ag'in that, too, and ruther guess mother and I'll have to adopt you. Hey, mother, what do you think on't?" as Mrs. Hull made her appearance from the dairy. "Keep you as well as not, out here on the farm—no gals nor nothin' of our own, and 'Lisha, he's off a-lawyerin' in Bostin. I declare you have picked up right smart and rosy in jest these three weeks you've been here, and I don't know 'bout lettin' you go back to git pale and pindlin' ag'in." And the farmer kindly stroked my head as I sat down to table.

I could not eat much of the savory edibles the good man and his wife pressed upon me, for the emotions that swelled in my throat. I had met so little kindness these latter years of my life—there were so few who loved me—that the honest affection of these simple people made my heart very tender.

When I left the kitchen, at the close of the meal, I overheard Mrs. Hull remark to her husband: "Somehow, her talk about the beach puts me in mind of 'Lisha; he allers spends half his time down to the shore, when he comes home, you know, Amos. Now, I dare say she'll go and write a piece of po'try or something about it, and it'll read beautiful when it's printed."

Later, that evening, when I had come down to sit with Mrs. Hull, she brought from the parlor a daguerrotype-case and placed it in my hand. I opened it. I do not know that there was anything peculiar in the face that met me save that it was frank and manly in expression; but the eyes had a depth and a certain clairvoyance, if I may so speak, that seemed to read my own thoughts in mine.

"It is 'Lisha's picture," said Mrs. Hull, with a pleased motherly expression in her countenance. "He brought it for a present, last summer, when he came home. And it looks jest like him—jest so pleasant and good! He ain't handsome; 'Lisha never was; but he's a good boy, Miss Jacassy! I shall allers call him boy, I b'lieve," she added, smiling, "though he's—lemme see, 'Lisha must be twenty-seven, this spring. They say he's gettin' to be a great lawyer, off there in the city. Maybe you've heard of him; his pardner is Cyrus Harlow; they're 'Harlow & Meredith.' "

"I have heard of the firm," I answered. "You must be very happy in your son, Mrs. Hull," I said handing back the minature.

"Son! La, bless you, Miss Jacassy, haven't I told you? Why he's Amos's nephew, his youngest sister's child. But theo we took him when he was only seven—all alone in the world, an orphan—and he seems jest like our own. Amos wanted to make a farmer of him; but, somehow, the boy took to his books. And so I told Amos 'twant no use to go ag'in natur', and, if we had plenty of this world's goods, and the farm brought in more'n we ever should know what to do with, we'd better give 'Lisha a college education, and we did."

"But had you never any children of your own, my dear Mrs. Hull?" I asked.

She did not answer; but the hand that held the minature trembled and snapped the spring suddenly. She left the room, and presently returned from the parlor with one of the profiles, cut in paper, which I had noticed in the little gilt frame over the mantel; and, when I turned to look upon it by the flickering lamp-light, I saw a tear upon the glass. The outline was that of a youthful face, plump and rounded.

"This is all I have left of poor Mary, except some of her hair in my bureau-drawer up stairs," she said, in a husky voice. "It was taken years ago, before minatures were invented. She died when she was only seventeen; it was over twenty years ago. Oh, Miss Jacassy you don't know how that blow took hold of our hearts, Amos's and mine! He can't speak about her to this day without cryin', though nobody'd call Amos Hull a soft-hearted man. It was our trouble that first opened our hearts to 'Lisha, I suppose. Deary me! I hope, if you ever marry and have children of your own, you'll never have them taken from you! Nobody knows, except them that lost 'em, the loneliness of a sorrow-stricken mother's heart. I like to have young people in the house," she added, returning from the parlor, whither she went to replace the profile on the wall—that simple outline of features which, though mingled these twenty years with the grave-mould, still conjured to the mother's gaze a vision of her dead and gone seventeen-year-old Mary. "I like to have you here, for it seems like having Mary with us again. Somehow, you put me in mind of her every day; your laugh sounds jest like hers; though my poor Mary wasn't accomplished, and didn't have such great talents as you have, and couldn't have made a verse of po'try to save her life. But she was a good girl, and would have been a sight of comfort to Amos and I in our old age, if she'd a lived." For the good woman did not seem to think that her Mary might have left her for another home; to her she was still the seventeen-year-old girl whose pleasant laugh and smile cheered the farm-house. A sight of comfort! but God took her, and he knows what's for the best! 'Lisha now, he'd like your po'try and writings, I dare say," she continued, in a more cheerful vein, " for he's allers readin' some book or other when he's at home. I do hope he'll be at home this summer, if he don't stay long enough to go down to the beach; he seems kind of bewitched with the sea, and, if he comes while you're here, he'll carry you there as often as you want to go."

"Yes, indeed! and then you can pitch a tent there, and live till you're tired," said farmer Hull, good-humoredly, coming in then from his out-door duties. "But look here, mother, I got some nice fresh fish down to the shore, this afternoon, and we'll have 'em fried for breakfast. Miss Jacassy's better begin to larn to like fish, if she's goin' down to live by the sea."

WOMEN CURED AT HOME

Women's disorders always yield from the very beginning of the treatment to the mild, but effective, action of Orange Lily. Within two or three days after commencing its use the improvement becomes noticeable, and this improvement continues until the patient is completely cured. Orange Lily is an applied or local treatment, and acts directly on the womanly organs, removing the congestion, toning and strengthening the nerves, and restoring perfect circulation in the diseased parts. In order to convince all suffering women of the value of this remedy, I will send a 35-cent box, enough for ten days' treatment, absolutely FREE to each lady sending me her address. MRS. FRANCES E. CURRAH, Windsor, Ont.

cause it pleases me, the honest, well-meaning kindness of these good people; and it pleases me, the life of quiet content I am leading here in this season of rest. I shall try to put off all thoughts of the future and live in the present; to enjoy all and everything that comes to me, the fresh air, the birds and flowers, the woods, and the sea. I will lay aside my pen, now; but I may write more some other day.

June 15th.

I like to talk about myself in my journal, as I talk about other people on paper; so I will sit down, this soft, rainy, June day, while there is a cool, pattering sound among the leaves of the great elm at my window, and write out—as I do for my heroines—a history of my life.

I have hitherto written nothing here of my antecedents, save that I am twenty-four, and unmarried, I am "literary," and my name is Jacassa Selina Bowen.

"'Jacassy!' Where upon earth did I get that name?" honestly queried farmer Hull, the other day; and I will answer here, and more at length, too, than I did him then.

"'Jacassa!' Where upon earth was a Southron by birth; though I have no memory of her save of a beautiful, pale face lit by dark eyes of unnatural brilliancy, as she leaned against the back of her sick-chair, while colored nurses watched her, and my father leaned over her tenderly. This was in the early morning twilight of my childhood. She died soon after. I remember I wept passionately when they told me; and my father brought me back to his native New England home, to the care of his maiden aunt, Miss Selina Bowen, who, with nobody to love or cheer her loneliness in her old-fashioned mansion, received me into her heart and home, adding her maiden name to my patronmic, with the proviso I suppose, that I was to inherit all her worldly goods and possessions at her decease. I do not remember much of my father save that he possessed an erect, martial bearing, and used to gratify my girlish fancy by sometimes arraying himself in a fine uniform, for he was an officer in the American navy. When I was only six, he was summoned from his long furlough into active service; and, kissing me good-by, he resigned me to Aunt Selina. From that voyage my father never returned. A coup de soleil smote him on the deck of his

vessel in the Mediterranean, and he died shorly after. When the government ship arrived on our shores, a bulletin of his death reached us in lieu of himself, whom we fondly expected. It was weeks before I—a ten year-old child—could mention him without a burst of tears; but afterwards, in the cheerful life of girlhood, my violent grief was subdued. I think, though, it was in those days that I began to cherish my intense love and yearning for the sea. Before, I had thought of it only as the great water whereon my father's ship sailed; but, from the time they brought the news of his death, I thought of it as his grave. We did not live near the coast—Aunt Salina's little estate was inland—but I used to go into the garret, and, seating myself at the window looking eastward, gaze away to the dark blue belt of the far horizon and fancy it the ocean, with every white speck of cloud drifting there a floating ship. So sharp the picture outlined my mental retina, I saw the snowy sail and tapering spars—the deck where my noble father walked in his officer's uniform, with the star on his breast—I saw the great, red, fiery sun wheel high above his head, the angry darts that struck him, his fall to the deck with his hand to his head—the sailors bearing him down into his state-room—the slow lingering—the death—the burial at sea—all this passed before me, distinct as the features of a panorama. Then when Aunt Salina's voice summoned me to some light task or duty, I would bear away with me the same pictures to be thought of till nightfall and dreamed of in my sleep.

And at school, too, while the other children drew pictures on their slates, or played at "tit-tat-too" when the teacher's back was turned, or the boys aimed paper bullets at some fly-target on the ceiling, I would turn the leaves of my Olney's Atlas till I came to the map of Europe, and, guiding with my finger an imaginary vessel's track along the Mediterranean, then threading her way through the narrow Gibralter pass, up round sunny Portugal, and into the wild Biscayan Bay, "here," I would wisper under my breath to some confidential schoolmate, "just here in the Bay of Biscay, my father died, and the sailors tied a round shot to his feet and buried him in the sea!"

The sea! Henceforth it was a sacred shrine to which my heart was ever turning. No wonder I looked upon it with intensest yearnings—it held my father. Some would have said I should have thought of it but with terror and dread; but not so; I loved it. I used to believe that when the sailors lowered him down, in his bright uniform, and the great green waves parted to receive him, the mermaids took him in their long beautiful arms, and sung to him as they carried him down to their coral bowers; and I loved to fancy that one of them might have worn the face of my own dear mother. It was a childish belief; but it gave me infinite satisfaction.

But I will now write of other things. At fourteen, Aunt Selina sent me away to boarding-school. The dear old lady had but little book-knowledge herself, but she was pleased that the grand-niece of her care should have every advantage. I was tall at that age—as tall as I am now; and I had my mother's eyes.

At regular intervals for three years I went home on vacation visits; but I think I really enjoyed myself better at school with my books and companions than at the quiet mansion where Aunt Selina lived in her staid, though comfortable way. I was a favorite with all the girls at the seminary. There was one, Elsie Wentworth, my roommate, with whom I was very intimate. I think all young people—girls and boys in their teens—have what may properly be termed "a Platonic age", when all the poetry and sentiment of their natures come tumbling uppermost, effervescing like new root beer; and I suppose I was in mine then, for I fancied Elsie Wentworth and myself "congenial." We read poetry together, exchanged rings and locks of hair, and vowed eternal friendship. (En passant, it is over five years now since I have seen her!) I mention her particularly here, because, as you shall see presently (I am so used to writing for the good public that I fancy the "reader" must be somewhere behind the curtain), through her I first opened the chapter in my life I am now going to relate.

I have already said I am "literary," but not, like Byron, did I "awake and find myself famous," it came gradually; but there was a dim prescience of my future occupation in my school girl days. A poem, one of the many written in a pink-rose, sentimental mood saw light in The Young Ladies' Repository and Casket over the unique signature of "Jacassa," eliciting the admiration of all the seminary girls; but when, one day, Elsie Amantha Wentworth—I write her name in full—brought me a number of the Yale Literary and Scientific Magazine, published monthly by a class of juniors at Yale, confidentially imparting that her brother, Montague Livingstone Wentworth, was editor—when she brought me this and showed me "Jacassa's" poem copied, with complimentary remarks by the editor on "the fair and accomplished young authoress, who, if we mistake not, will make her mark" (query: her x mark?) "on the future song-literature of her land; giving evidence thus early of having quaffed from the Parnassian spring:"—when I

FREE SAMPLE CULVERT To FARMERS

Say you are interested, and we will gladly send you **Free** and postpaid a sample of the only **Practical** culvert and a handsomely illustrated book telling all about it. For drainage, road-repair, and a score of farm-uses there is no culvert so economical as this. Made of heavy **Billet Iron**; curved cold into half-sections. Then deeply corrugated---makes it five times stronger than smooth-surfaced pipe. Heavily galvanized with lead and zinc to make it proof against rust, dampness, decay, corrosion. Will outlast any other material.

LEARN ALL ABOUT THE MOST PRACTICAL and DURABLE CULVERT

PEDLAR NESTABLE GALVANIZED CULVERT

These pictures show how easily and quickly you can lay **Pedlar** Culvert. Comes nested, half-section within half-section---saving freight and cartage. Triple-thick **Flat** flange locking ribs on each side are clamped together by a simple tool---no bolts nor rivets needed. Joints are broken---**only** culvert you can do that with. Ends interlap. Will stand tremendous strains. Won't leak, nor buckle, nor crack from frost. **Cheaper than wooden culverts**

An Investment—Not An Expense

Investigate first. Send for the free sample and book. Then recommend this culvert to your township officials---push the Good Roads Movement---this culvert keeps roads in better shape. Use it, too, for any drainage about your farm---there's a size for every purpose. Railways use and approve it---and you know what careful buyers railways are! Investigate.

DR. WOOD'S NORWAY PINE SYRUP.

Is Specially Calculated To Cure All Diseases of the Throat and Lungs.

Coughs, Colds, Bronchitis, Sore Throat, Hoarseness, Croup, Pain or Tightness in the Chest; and all Bronchial Troubles yield quickly to the curative powers of this prince of pectoral remedies. It contains all the virtues of the world famous Norway pine tree, combined with Wild Cherry Bark, and the soothing, healing and expectorant properties of other excellent herbs and barks.

Nasty Hacking Cough. Cured.

Mrs. John Pelch, Windsor, Ontario, writes:—"I was troubled with a nasty hacking cough for the past six months and used a lot of different remedies but they did me no good. At last I was advised by a friend to try Dr. Wood's Norway Pine Syrup and with the first few doses I found great relief and to-day my hacking cough has entirely disappeared and I am never without Dr. Wood's Norway Pine Syrup in the house."

The price of Dr. Wood's Norway Pine Syrup is 25 cents per bottle. It is put up in a yellow wrapper, three pine trees the trade mark, so be sure and accept none of the many substitutes of the original "Norway Pine Syrup."

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

NO BETTER TIME for entering than just Now

St. John's summers are so cool, our position so elevated and our rooms so well ventilated, that we do not find it necessary to take a summer vacation, and we have good classes during the warmest weather.

Also, students can get more attention than in winter, when our rooms are crowded.

All For The Best.

"A little of life to worry,
A little of life to sing,
A little of wintery weather,
A little golden spring,
A little of life to struggle,
A little of life to rest;
And whether of one or the other
It is all for the best."

A Comfortable Farm.

When the early grass is springing
In the pastures on the hills,
And the nesting birds are singing
In the bushes by the rills,
And the orchard buds are swelling
Under springtime's gentle charm,
It is pleasant to be dwelling
On a comfortable farm.

When the summer breezes blowing
Gently sway the golden wheat,
And the time is near for mowing
Timothy and clover sweet;
When each one delights in giving
Help to save the crops from harm,
It is pleasant to be living
On a comfortable farm.

When the autum fields are browning,
Corn and fruit all gathered in
All the labor, richly crowning,
Filling barn and crib and bin,
Then there comes the time of pleasure
Peace and rest for mind and arm;
Then you know you have a treasure
In a comfortable farm.

When your winter fire is burning
On the hearth so bright and warm,
And the pleasant sounds of churning
Mingle with the howling storm—
When you hear the wild winds chiding,
But your heart feels no alarm,
Then thank God you are abiding
On a comfortable farm.

Brightening Up the Old Place.

The brightening up of a shabby farm yard, or set of farm buildings, does not depend entirely on the paint pot and brush. See what you can do with a few tools; the rake, hoe, hammer, pruning saw, and a few plants, or seed. Then if you can paint, by all means do so.

Rock piles and rubbish heaps are unsightly and it is not necessary that they should be so. In winter, nature covers them up, but in the spring she uncovers them again, and it looks as if she were reminding you that it was your turn next. Why not follow her example?

Throw some soil over the stones and rubbish; then some dressing, and a little more earth, and on one heap plant tall nasturtiums. An old leaky pail set into the heap near the top, and filled with water, now and then through the hot, dry weather, will help make the rubbish pile a thing of beauty. On another heap, should there be more than one, plant the delicate little Arabis (rock cress), for a border around the base, and then over the entire heap plant portulacas in mixed colors, and the mass of color will be beautiful, or if you prefer usefulness to beauty, plant squash seed.

If there are rough stone fences near the house, they may be made beauty spots by planting hollyhocks, golden glow, or phlox in front of them. If you like vines better, the wild cucumber vine (Echinocystis); or the variegated hop vine will produce a pretty cover. If in this case too, you prefer the useful to the beautiful, you will find the Japanese cucumber, or the scarlet runner bean, good climbers and very pretty.

If there are no shade trees near the house, and no piazza, make a trellis frame, no matter how rude; cover three sides with poultry netting, and plant vines on all three sides.

The top may be covered with a piece of canvas, if no regular roof has been provided. It may be made

You Can Afford to use 40c. Tea Just as Well as 30c. Tea if You Use 40c. Red Rose

A pound of 40c. Red Rose goes further than any 30c. or 35c. tea and it is distinctly superior in quality.

30c. and 35c. Red Rose Teas are good teas, so good that very many people say they want nothing better. But, if they would once try a package of the 40c. Red Rose they would use nothing else in future

Just think, five cups of 40c. Red Rose Tea will only cost 1c. One lb. makes over 200 cups. Not a question of affording.

large enough for the hammock, or just large enough for a couple of chairs and a stand on which "mother" can rest the dish, while she snaps the beans, or hulls the berries, and in the afternoon, it will be handy for her sewing or book.

On the Spoiling of Children.

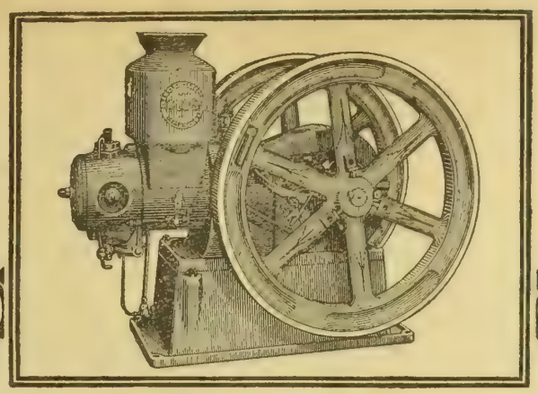
Teachers are almost invariably the object of bitter criticism, much or most of which is wholly unjust, and almost all of which could be avoided if parents would take the time for personal investigation. Most men are unable to get away from business during school hours, and mothers won't take the trouble. Was there ever a boy or girl, not under dicipline, whose eye did not light up with pleasure at the sight of a parent entering the school room? Was there ever a teacher who did not welcome a visitor who came not to blame, but to learn what was going on? It is ignorance of conditions which is responsible for much of the fault-finding. The real faults are seldom mentioned.

The truth is, we parents are selfish. We are neglecting our children and trying to salve our own consciences by blaming others. No matter how much money is spent, no matter how good the system of administration adopted, we are not going to get very far unless parents take hold and do more of their proper share of education. In reality the teacher is only the parent's helper. It is not wholly an ideal condition to have children in school at all. The home is where they should get their best education, and where they ought even now to get the most of it. The school of today is a rather crude invention for accomplishing the greatest good to the greatest number, and it is of value only as we supplement its work at home. That is where the trouble arises.

But while we are selfish, we are an affectionate people. We spoil our children. We let them do pretty much as they please, in reasonable limits, so long as they do not bother us. The intelligent parent who spends ten minutes a day with each child in loving discussion of matters which interest the latter is not likely to have much trouble. to say that the majority do not. Some parents do this, but it is safe Isn't the teacher hired for that sort of thing? But it is not wholly from a lack of time or inclination. In these days parents seem to have a feeling that they are not very good advisers for their own children, and have a sneaking hope that the schools will make up their own deficiencies. Until such conditions are changed there is going to be no improvement. From "What is Wrong With Our Public Schools," by Joseph M. Rogers, in April Lippincott's.

Putting Away Winter Clothing.

Among the many duties which demand the housekeeper's careful attention during the spring season few are more essential than the proper cleaning and putting away of winter clothing. There is nothing better for keeping the articles in through the summer than stout muslin or paper sacks and pasteboard boxes, which may be lined with paper and the cover and openings sealed together with strips of cloth pasted carefully over them. Then, too, it is best to enclose with them some strong repellant. The brushing given the garments or furs before they are put away does the greatest good, for if there are eggs already on the clothing a vigorous shaking and careful brushing is sure to remove them. If there is a piece of soiled woolen cloth left in the wardrobe or closet it will attract the moths and then they may ruin some nice article. Remove every article from closets and wardrobes and scrub every inch of the woodwork with hot borax suds, as this cleanses perfectly and then it purifies and disinfects, and when the wood is dry wet with spirits of turpentine. If there are any grease spots found on woolen articles that are to be washed wet them thoroughly with the turpentine. Leave it on for several hours, then rub between the hands and wash the garments in strong borax suds. This suds is excellent for washing the woolen blankets. After washing any woolen article through this suds rinse through two or three waters with a little borax in each, as all woolen articles washed in this way are left as soft and clean as when new. In fact, there is nothing better than borax and turpentine for keeping moths out of the house and away from all woolen articles. A good way to keep rugs or carpets free from moths, is to clean them thoroughly, then take a paint brush and brush all around the edges with the turpentine. In storing the woolen goods strew bits of soft cloth soaked in turpentine among them. This keeps insects away as well as the moth balls and the odor is not so disagreeable as that left by the moth balls. M. A. H.



Olds Engines

Send for our new catologue.

YOU can learn engine facts you really should know before deciding on your gasoline engine.

The catalogue proves why it is good judgment to own an Olds engine and be sure you have the most practical, most economical, most durable rather than to get a cheap engine and take chances on losing all it costs you.

Besides the highest quality of workmanship and material the Olds Engine has many special and exclusive features. Each one means a great deal to you.

1. Removable water jacket—may save you $100.00.
2. Seager Patent Mixer has not a moving part to wear or get out of order.
3. No gasoline pump of any kind to leak or be primed.
4. Cylinders and Pistons of special metal—ground to exact size.
5. Cylinder and head one piece—water cannot enter cylinder.
6. Safety Governor—positively prevents engine's running away.
7. Absolute guarantee—No REPAIR BILLS for the FIRST YEAR.

Tell me what you need an engine for and I will assist in selecting the proper size. Write the nearest office.

Using Rhubarb.

About the first thing that comes to our gardens in the spring is the rhubarb. It should be used more freely than it is because of its medical qualities. It is claimed that it not only aids digestion, but it is a foe to rheumatism and gout, neutralizing the uric acid in the system. Because of its health giving qualities, it is an aid to the complexion when freely eaten. There are so many ways of serving it, the housewives should avail themselves of recipes, and study out others for themselves.

Rhubarb sponge is an old dish. Line a dish with slices of stale cake, pressing them firmly around the side, then fill the dish with stewed rhubarb that is not too wet, sprinkle with sugar, cover top with more slices of cake, cover with a plate, weighted down for a few hours, or until the cake has entirely absorbed the juice. Serve with a nice custard. Stale bread may be profitably used instead of cake.

Clean, but do not peel, the rhubarb cutting into quite small pieces; put in an earthen dish, or porcelain-lined and as much sugar as wanted; set the dish in a moderate oven and let cook slowly until done. Very little, if any, water should be added, as the stalks make plenty of juice. Rhubarb cooked this way can be put into glass jars as soon as soft and sealed for later use.

Rhubarb Pie.—Wipe the stalks but do not peel; cut into half-inch pieces; lay in a pie-dish and sprinkle plenty of sugar over it; use but a very little water, cover with a nice crust-dough, and bake in a hot oven for half an hour; serve hot.

As the season advances, rhubarb may be made into jelly, marmalade or jam; or it may be canned with cold water—no cooking; or it may be canned after heating until soft in an oven. Jelly is better made later in the season, when the plant is not so tender and juicy, as it will require less cooking.

"BANK SHARES BOUGHT AND SOLD.

American Securities Co., 627 Confederation Bldg., Toronto.

Constipation is the root of many forms of sickness and of an endless amount of human misery.

Dr. Morse's Indian Root Pills,

thoroughly tested by over fifty years of use, have been proved a safe and certain cure for constipation and all kindred troubles. Try them.

25c. a box.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Construction of Wharf at Shediac, N. B.," will be received at this office until 5 00 P. M., on Thursday, May 26, 1910, for the construction of a wharf at Shediac, Westmorland County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department, at the office of E. T. P. Shewen, Esq., District Engineer, St. John, N. B. Goffrey Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster at Shediac, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, with their occupations and places of residences. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, made payable to the order of the Honourable the Minister of Public Works, for the sum of two thousand one hundred dollars ($2.100.00,) The cheque will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender,

By Order,
NAPOLEON TESSIER,
Department of Public Works,
Ottawa, April 26, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

PILES CURED at HOME by New Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

read this, then, indeed, I began to imagine that the "divine a—atus" was surely mine by right.

"Oh, Jacassa, you must see my brother Montague!" said Elsie. "He's splendid! Such an airMso distingu! just like a novel hero. I do wish he'd come here—how the girls would envy us him! He wears his hair long, and Byron collars, and he dotes on 'Childe Harold!' I know you and he would be congenial! You see I've written him all about you; and what do you think, darling?" and, with a mysterious air, she took from her pocket a little pink note, redolent with jockey-club, and superscribed in a delicate, running chirography:—

"To
THE FAIR JACASSA.
Helicon's Fount.
By Pegasus's Express.

And this was the commencement of my acquaintance with montague Livingstone Wentworth, this pretty, flattering note, worded so faultlessly and interspersed with poetic quotations—a snare set by a heartless sentimental college fopling, to entrap a silly-headed, equally sentimental school-girl.

(Continued next issue.)

Physical Strength and Mental Keenness.

Few of us appreciate the tremendous influence of the physical body upon one's general mentality. The mind is credited with such a vast influence over the body as to be actually able to cure serious chronic ailments, and I am firmly convinced that it does possess such a power in a few instances. The value, for instance, of cheerfulness and hopefulness can hardly be too strongly emphasized. The value also of a strong determination to accomplish certain results is rarely properly appreciated. I am fully confident that the influence of the body upon the mind is almost equally as great. In other words, a diseased body cannot possibly create that particular quality of blood which is necessary to thoroughly nourish the brain. Therefore, the brain, and the entire nervous system are affected by this impoverished nourishment. Even when every effort of the mind is made with a view of counteracting influences of this kind, you can well understand that the mind would not have the same power as if it were supplied with a different quality of nourishment. A weak body, for instance, cannot endow one with strong determination. The weak body usually means a weak will.

It is clear that any effort that might be made for the purpose of thoroughly developing the body in all its parts, will also enable one to secure rich rewards from a mental standpoint. With a more powerful body you are endowed with a greater degree of mentality. You will have what might be termed more mental force. You will have more "driving power" behind you mental efforts. Your conclusions will be more firmly fixed and you will be more capably equipped to fight for them in the arena of existence.

Retaining Youth.

Whether you are forty or fifty, or even seventy, you can be young. You can actually secure the return of youthful powers. Of course, this cannot be accomplished in a day or a week. But those who are passing or who has already passed into old age can be promised renewed youth.

Do not bother for a minute about the theory of germs in the intestines as the cause of failing bodily powers. To be sure, diet may have a great influence in shortening one's life, but it is not germs in the intestines

A MAN'S BOOK.

A PRIVATE TREATISE, WITH ILLUSTRATIONS, RELATING TO DEBILITY, ITS CAUSE, EFFECT AND HOME CURE.

Let Me Send It to You FREE.

Here is a little volume of cheer and helpfulness which all men young or old, can read with great profit; it contains much valuable information of a private nature, is fully illustrated, and represents the practical knowledge I have gained from forty years of actual experience in giving help to upwards of 100 000 enfeebled, nervous, discouraged men. Just a postal card with your name and address and the book will be forwarded free, sealed, by return mail and with it, as well, I will enclose a full description of my new 1910 model Electric

Health Belt.

If you need new strength, this wonderful appliance must appeal to you. It generates a pleasant, exhilarating currant instantly felt, though it can be made any degree of strength from mild to strong by simply turning the needle of the current regulator; worn nights while you are sleeping, it pours quantities of health-giving, soothing electricity into your sick, weak nerves; you get up mornings feeling bright, strong, full of courage and ambition; it takes all the weakness and pain out of your back; it is a great remedy for your kidneys, bladder, stomach, liver and other vital organs; it cures rheumatism in all parts of the body; it is a courage-giver of the highest order; it brings new strength where weakness exists; it will restore you to vim, rigor and true manhood as sure as night follows day; it makes you feel young and look young; you will live longer for its use; you can throw away all drugs and commence to live as Nature intended you should—a man among men, healthy, happy and vigorous. I can send you thousands of testimonials if you care to see them. Here is a sample Cure:

"Your Health Belt cured me of Nervous Debility, Lost Vigor, Kidney and Bladder Troubles after all else failed.
"CHARLES L. SNELL,
"Middleport, N. Y."

In all instances I concentrate the full positive current at small of back; it thus enters the system at the nerve and vital centre,

passing thence through the different weakened organs, giving them new life and force. You can get the Belt.

ON TRIAL UNTIL CURED

PLEURO-PNEUMONIA AND BRONCHITIS

Brought Mrs. Baker to Death's Door. Father Morriscy's No. 10 Saved Her.

Of the many hundreds of cures wrought by Father Morriscy's No. 10 (Lung Tonic) few are more remarkable than the saving of the life of Mrs. John S. Baker, of 164 Rockland Road (North End), St. John, N.B. She wrote on Oct. 16, 1909:

"I wish to express my gratitude that I am living to-day, saved from the grave by Father Morriscy's No. 10 (Lung Tonic). This time last year I had pleuro-pneumonia and bronchitis, and had been given up to die, and had my lungs tapped in the City Hospital, and never expected to walk again; I was continually getting worse every day. I came home from the hospital, and everyone was watching fo me to die. I tried everything but there seemed to be no cure for me.

"I began taking Father Morriscy's No. 10, and the second day I could eat without pain. I used 22 bottles of No. 10, as I was run down right into consumption, and for six months was just a shadow until I began to use it, and now I am in good health, and surprised most of my neighbors by gaining so quickly. I feel it my duty to publish it everywhere I can, as with all I can say I cannot recommend it too highly—it was a life saver to me, and I am very thankful to recommend it, as it is worth all it is said."

Father Morriscy's No. 10 is very different from the many preparations that simply relieve a cough. No. 10 relieves the cause of the cough, restores the membranes of throat and lungs to a healthy condition, and tones up the whole system, giving strength to resist future attacks.

Trial bottle 25c.—regular size 50c. At your dealer's or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 92

A Windsor Lady's Appeal.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painfull or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Welancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. Wy book, "Woman's Own Medical Adviser," also sent free on request. Write to-day. Address Mrs. M. Summers, Box m 309, Windsor, Ont.

that actually cause decay. It is simply and solely the harboring of dead cells. Now how can we get rid of these cells? There is only one way to entirely eliminate them from the body and that is through the activity of the muscular system. Do not pay the slightest attention to that senseless twaddle to the effect that when you are fifty or sixty years of age you should cease all physical effort. Conclusions of that kind are simply the maunderings of vapid brains. Activity means life. Activity is always a part of youth. To liven up and make youthful the tissues throughout the entire body, every muscle of the body must be brought into thorough activity at fairly regular intervals. It is not necessary for you to make laborious work of your exercises. Make them as pleasurable as possible. But you must not for one moment divert from the main conclusion that to retain the suppleness and activity of youth every part of the body must be used. It does not make a great deal of difference what system of exercises you may adopt so long as you give reasonable attention to the necessity for spinal strength. In fact, many recreative exercises can be used in order to bring about the desired effect.—Bernarr Macfadden.

The Teeth And How to Brush Them.

Always brush the upper teeth from the gum down and the lower ones up. Brushing them across is said to loosen them, and besides it does not cleanse the teeth so effectively. By brushing the teeth vertically, from the gums up or down, as the case may be, the bristles remove whatever may be lodged between the teeth.

The under side of the teeth must be treated even more carefully than the surface, for neglect will allow the tartar to gain a firm hold thus making professional service for its removal a necessity.

The choice of a tooth brush is of more importance than is generally supposed. Choose a brush, the bristles of which are not too stiff. as hard bristles are apt to cut the gums, which sometimes causes serious mouth sores. Those with uneven bristles are superior to the ordinary brush. The raised bristles at the end of the brush enable the user to get into the "cups" of the broad teeth used for crushing the food, at the back of the mouth. Particles of food find these teeth good resting places and as a result we find that it is nearly always these teeth in which cavities first appear.

Hints on Massage.

Massage, to be effective, should not be given without having previously bathed the face with hot water so as to open the pores and soften the skin; in which state it readily receives the nutriment contained in the cream or oil with which it is massaged.

After a thorough massage, the flesh is, of course, softened, and an astringent is necessary to close the pores and give firmness to the skin. This prevents the formation of surface wrinkles. Cold water is a good tonic and should be used plentifully. Among other good astringents are camphor water, white wine and tincture of benzoin, ten to twelve drops of which are enough for a basin of water. Another good astringent lotion is made by pouring one-half pint of white wine vinegar over one ounce of dried rose leaves; let this stand for a week, then strain, and add one-half pint of rose water; apply it by dipping a soft cloth into the lotion and wiping the face with it, or add one tablespoonful of the lotion to a glass of rain water and wash the face.

Facts About Diseases of Children.

There are, of course, numerous causes for the intestinal diseases from which children most frequently suffer. As a rule, however, they are due to overeating, improper food or partially masticated food. The fermentation of the contents of the stomach and intestines under such circumstances often produce poisons that are inimical to life and health. The nervous system naturally recognizes the presence of this foreign material, and endeavors to eject it, and the symptoms that follow as a result of this endeavor, indicate the presence of intestinal disease.

In the majority of cases intestinal troubles in children are brought about through the use of unripe fruit, decayed vegetables or other impure foods, although irrating medicines are sometimes liable to cause unfavorable symptoms. Chronic constipation will in many cases produce disease, because of the poisons that are frequently created by this unnatural condition. A blow or strain may sometimes cause catarrh of the bowels. In a few instances extreme exposure when the constitution is debilitated, congestion of the heart, kidneys, or liver may also cause intestinal troubles. The reason for these symptoms is that the poisons which cause these diseases find lodgment in the bowels. Imperfect mastication and indigestion are also fruitful sources of these troubles.—Bernarr Macfadden.

Brantford Roofing

passed the experimental stage many years ago

FULLY fifty per cent. of the concerns manufacturing ready roofing have come into existence during the last few years. Their products are therefore in the experimental stage. Their brands have not been in use long enough to determine their actual value.

Now, Brantford Roofing passed the experimental stage many years ago. It is made by a company which was one of the "pioneers" in the roofing industry. It has a record of many years of satisfactory service behind it. It is worthy of your FIRST consideration when selecting a LASTING roofing material for your home or barn.

On request we will send you a list of those who have roofed their buildings with Brantford Roofing in your locality. Then you can see and learn for yourself how satisfactory Brantford Roofing has proved with your neighbors.

You have your choice of three styles of Brantford Roofing—ASPHALT (silicia finish), RUBBER (smooth finish), CRYSTAL (mineral surface). All three styles have a 99 per cent. pure Asphalt saturation.

Get our Free Roofing Book and Samples. Then choose the style you decide is best adapted to your particular job.

Cabbage Salad.

Two large raw eggs well beaten, six tablespoonfuls of cream, one-half teaspoonful salt, six tablespoonfuls of vinegar and a small piece of butter. Put on the fire and cook, stirring constantly until quite thick. Have a half head of cabbage chopped fine, sprinkled with salt. Add to the dressing when cold two tablespoonfuls of cream and pour over the cabbage.

Putting Away Woolens and Furs.

Many a housekeeper packs away her furs and woolens with fear and trembling, not knowing what may be their condition when they are unpacked in the fall. In many cases there certainly is reason for this fear because the articles have not been thoroughly cleaned. If moths or their eggs are left in the folded articles, there is sure to be a large colony of larvae, which will eat their way through the woolen and fur articles in the vicinity. On the other hand, if closets and other receptacles are made absolutely clean, and then treated with some insecticide, and if the garments are made perfectly free from insects and their eggs, the housekeeper can go away away with an easy mind.

When ready to put away furs, feathers or woolens, have some clean sheets or cotton bags. For garments that are to be hung up, the bags are better than sheets. Have the closets or boxes made clean as directed. Brush the furs, and shake well. Hang in the sun for several hours. If you have a suspicion that there are eggs in the furs, comb each piece of fur well. Pin the articles in the sheets, and on the sheet pin little wads of cotton batting, dampened with oil of cedar. Paint the joining of the boxes with oil of cedar, then line with paper. When the box is full, cover with paper, put on the regular cover, and put away in closet or storeroom.

Feathers and woolen garments are treated like furs. I am sure that if these instructions are followed, no kind of insect will appear in either closet or box. The odor of oil of cedar is very strong, but passes off in a few days when there is thorough ventilation. Of course, it is important that this odor should be retained in closets and boxes, and for this reason they must be closed tight. Oil of cedar makes a reddish-yellow stain which is hard to remove; therefore it should not come in contact with the clothing. The sheets used should be kept solely for packing purposes.—Maria Parloa, in Ladies' Home Journal.

Feeding the Sick.

I would like to place in every household a discourse of how not to tempt the invalid. I would like to impress every person with the necessity of giving the digestive organism a complete rest while suffering from acute disease. This rule must be followed if one expects to recover speedily, and without needless suffering. Disease is prolonged, the system is weakened, and death is far more liable to ensue, if this policy is not adhered to. Let the invalid wait for an appetite, let this desire for food be strong and even intense, and when he can enjoy every morsel, then, and not until then, is he really ready to assimilate food of any kind.

Do not tempt a reluctant appetite. Do not force the stomach to digest food for which it has no need. Thousands of suffers have been sent to early graves through self-poisoning of this sort. When you eat without appetite you are simply poisoning yourself. You are filling the blood with all sorts of effete matter, the elimination of which often results in the appearance of serious symptoms of some disease.

There is a mystery about human life, and the wonderful processes that are associated with the various phases of disease, that even the most skilled physician knows little about. A physician stands beside a sick-bed; he sees the patient there struggling for life; he sees the vital spark fast fading away. At such a moment, if he is possessed of intelligence, he realizes his impotence, his inferiority, his inability to understand the great mysteries there before him.MBernarr Macfadden, in Physical Culture.

2 Two Pairs of Hosiery FREE 2

You pay the same price for the hosiery you are now wearing as you would for Pen-Angle Guaranteed Hosiery. Yet it isn't nearly so serviceable as Pen-Angle. We are so positive of this that we doubly guarantee Pen-Angle Guaranteed Hosiery to wear longer than any other cotton or cashmere hosiery, we care not what make or brand.

This is Our Double Guarantee

We guarantee the following lines of Pen-Angle Hosiery to fit you perfectly, not to shrink or stretch and the dyes to be absolutely fast. We guarantee them to WEAR LONGER than any other cashmere or cotton hosiery sold at the same prices. If, after wearing Pen-Angle Guaranteed Hosiery any length of time, you should ever find a pair that fails to fulfill this guarantee in any particular, return the same to us and we will replace them with TWO new pairs FREE of charge.

Buying hosiery on this plan you cannot lose a single cent. If Pen-Angle Guaranteed Hosiery fails to fulfill the guarantee in any particular we bind ourselves to give you back, free of charge, twice as many pairs as you pay for.

The largest hosiery mills in Canada stand back of this astonishingly liberal guarantee. It will be fulfilled to the last letter.

Remember, the wear is not the only thing we guarantee. The fit, the comfort, and the permanence of the dyes are also guaranteed. Could you ask for more?

Pen-Angle Hosiery is made by an exclusive patented p ocess. It is the only Seamless Hosiery, made in Canada, that has the shape knitted into it.

The ordinary way to make Fashioned Hosiery is to stretch it into shape while wet. Such hosiery loses its shape after one or two washings. 48

Ask your dealer to show you Pen-Angle Guaranteed Hosiery. Our guaranteed lines have a guarantee slip in each box. Pen-Angle trade-mark is on the hosiery, too.

If your dealer cannot supply you, state number, size and color of hosiery desired and enclose price, and we will fill your order direct.

FOR LADIES.

No. 1760. Black Cashmere hose. Medium weight. 2-ply leg. 5-ply foot, heel, toe and high splice, giving strength where strength is needed. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1150. Cashmere hose. Medium weight. 2-ply leg. 4-ply foot, heel and toe. Black and colors. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1720. Cotton Hose. Made of 2-ply Egyptian yarn, with 3-ply heels and toes. Black and colors. Box of 4 pairs, $1.00; 8 pairs, $1.50.

FOR MEN.

No. 2404. Medium weight Cashmere half-hose. Made of 2-ply Botany yarn with our special "Everlast" heels and toes, which add to its wearing qualities, while the hosiery still remains soft and comfortable. Black and colors. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 500. Winter weight black Cashmere half-hose, 5-ply body, spun from pure Australian wool. 9-ply silk splicing in heels and toes. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 330. "Everlast" Cotton Socks. Medium weight. Made from 4-ply Egyptian cotton yarn, with 6-ply heels and toes. Black, light and dark tan. Box of 3 pairs, $1.00; 6 pairs, $2.00.

WARRANTED HIGH PENMAN'S GRADE UNSHRINKABLE

Respect Your Stomach.

Develop a respect for your stomach. Such a policy will in every case yield splendid dividends. Unless you treat your stomach with respect, unless you feed it intelligently, if not scientifically, you cannot expect the blood-making process to be properly completed.

In strength-building one must first learn the importance of limiting the amount of food to what you actually need. Many persons live to eat. Now one should eat to live. By following a policy of that kind you can actually increase your length of life from ten to forty years. You may consider this statement exaggerated, but if you will study the science of diet, and heed the plain conclusions that will come as a result of such study, you will be compelled to admit the accuracy of this statement. The body is fed by the blood, it is nourished from the blood. The blood-making process begins in the stomach, and when you overfeed this important organ, and continue to overfeed it, various poisons are absorbed into the system through the defective digestive process that thereby results. One might say that nearly all diseases begin in the stomach and might also say that disease continues in the stomach. It helps in the process of making impure blood, blood that contains all sorts of poisons. This vile stuff is sent coursing through the body, and under such circumstances some have the incomprehensible audacity to wonder why they are not well. In many instances they might more reasonably wonder why they are alive.—Bernarr Macfadden.

Consumption Book FREE

This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1554 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

Report of the Seed Branch.

(Continued from page 521)

During March 1,570 samples were received at the Ottawa seed laboratory for purity or germination test. Of these about twenty per cent came from farmers. Of the 553 samples of red clover tested for purity 211 graded No. 1, 184 were saleable under the Seed Control Act but not first quality, and 56 were prohibited. Of the 264 samples of alsike tested, 103 were No. I, 127 saleable and 33 prohibited. Of the 216 samples of timothy 201 were No. I and twelve were saleable. Of the 74 samples of alfalfa 51 were No. 1, 17 saleable and five prohibited. Two of the red clover samples, one of the alsike and one of the alfalfa were sent in for germination test only and were therefore not tested for purity.

GEO. H. CLARK,
Seed Commissioner.

Feeding the Chicks.

Feeding now claims attention. I do not know of any other subject connected with poultry that has, from time to time, been more criticised or written about than that of the feeding of chickens. Every breeder has his own particular feed or system, and many are very careful lest any word they may let drop reveals any of their knowledge. Each thinks his own system the best, but whether this is so or not, it is hard to tell. Some believe in the dry feed system, whilst others would not have it at any price. Some believe in the no water theory, and others are dead against it.

Both systems have their advantages and disadvantages, as I know from experience, having tried both systems. I do not think I shall try the dry feed syste again, though I am rather a believer in the no-water theory for the first five or six weeks of the chicken's existence, provided they can be put on a grass run when they are turned out-of-doors. I do not think the feeding need vary much for the first ten or twelve weeks, for either hard or soft-feathered Bantams. Practically the same food will do for one or the other.

The first feed, which need not e given for the first twenty-four, or even thirty-six hours, must be composed of hard-boiled eggs, and here the clear eggs taken from under the hen at the time of testing the same comes in useful. They must be chopped up fine and mixed with bread crumbs. I find the machines used by canary fanciers for grinding eggs useful. Some fanciers I know do not altogether approve of giving hard-boiled eggs, but prefer the bread being soaked in the raw eggs.

However, either system will do, and this should form the staple diet for the first few days, varied with plain biscuit soaked in milk. At the end of four or five days good quality broken rice, dried off with thirds or any of the advertised chicken meals can be given. Rice will, to a big extent, counteract any signs of diarrhoea, rather a troublesome ail...ent amongst chickens. The way to cook rice is to put it either in a pan or earthenware jar, and cover with milk or water. Cook slowly for about three-quartes of an hour, and see that it does not clog together, bur remains in single pellets. The meal then easily adheres to it. Cook only sufficient for one day, and it is then more sweet and wholesome.

For the evening feed, canary seed or some of the dry chick foods can now be introduced, and as the chickens increase in age, dari, groats, wheat, millet and a little hempseed can be given. Occasionally, for one of the meals during the day, bread and milk, can with advantage, be given, this being a very good pick-me-up, especially when the chickens are making a lot of feather.

For the first fortnight the chickens should be fed every two or three hours. Little and often is a motto that should be obeyed in chicken rearing. One cannot feed too early as soon as daylight appears, and many are the fanciers who late, and very late, go round with lamp and corn bucket to give their pets the last feed of the day. It certainly pays to attend well to the growing stock.

After the first fortnight a certain amount of weaning can take place, so that at the age of three months, four or five meals a day will suffice, and this number should continue for another couple of months, when the normal number of three will be found sufficient.

Green food should be given from the very first, and a small amount of finely chopped meat may occasionally be given. Fine flint or sand grit must always be within reach, this being a very important matter and it is wonderful to see the amount the little creatures will devour. Flowers of sulphur or a little linseed may now and then be judiciously added to the food to help the chickens in their feathering. I prefer the linseed to be boiled, or allowed to steep in water for twenty-four hours before being given.

Keep the coops and runs in clean condition. If the floor of the coop is of wood keep it well sanded or covered with chop or peat moss. Dust the hen at least once a week with insect powder, and at the same time examine the chickens for ticks, etc. These pests will be found on the head, under the wings, and near the vent, and prevent the chickens from thriving. There are many remedies for the keeping down of these insects, a few of them being vegetable oil of tar, sweet oil, weak solution of paraffin, etc. Theiplaces infested should be touched with any of the remedies mentioned.—H. Inman, in Feathered World.

Portable Poultry Fence.

I have made a substantial, convenient and useful portable fence from 48-inch poultry wire netting. Anything that will make a sufficiently strong stake will hold it up. With an iron bar I make holes about 8 feet apart around the lot where I want my new poultry yard to be. Stakes are driven firmly into these holes. Then a fourpenny nail is driven into the stakes for the wire to hang on.

In hanging the fence, I start at one corner and unroll the netting until I arrive at the starting point. If there is more wire than I need, I leave it on the roll. Then I begin to hang the netting on the nails, which are only partly driven in, stretching the wire as I hang it. Plastering laths I then nail over the netting to the stakes with two or three fourpenny nails, whose heads are allowed to protrude just enough so they can be drawn with a hammer when I want to move the fence again. If one roll of wire is not enough, I overlay a second roll and proceed as described. The unused part is wired or tied with string to prevent it falling down and becoming unrolled.

When the season closes, and I wish to put the poultry in permanent quarters, the nails are drawn, the wire rolled up, the stakes pulled and all laid away for another year. I never cut a roll of netting except for a permanent fence.—S. X. A., in New England Homestead.

Amatite ROOFING
NEEDS NO PAINTING.

MOST ready roofings require special painting and coating, and unless this is done regularly, you are sure to have leaks and trouble right along.

If you use Amatite, nothing of the sort is required. You will have real roof protection WITHOUT PAINTING of any kind.

Amatite is made to stay waterproof and give protection year after year, without any thought or care on your part.

FIRST—Because it is waterproofed with Coal Tar Pitch.

SECOND—Because it has a real Mineral Surface.

Amatite, owing to these features, is the most economical roofing made. Its first cost is low, and you are SAVED all future expense for repairs or paint because it will need neither.

If you haven't seen Amatite, write for a sample to-day. From it you will very quickly understand why it doesn't require painting; why it does not leak; and why it saves you money.

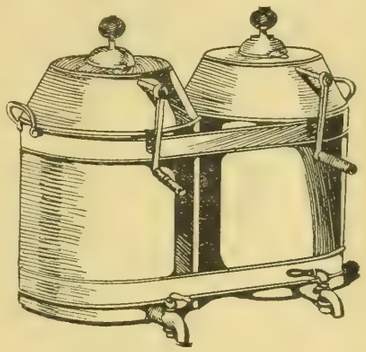
A 'BOON and BLESSING'

You can banish the drudgery of wash day, and can clean your clothes more thoroughly without rubbing, in shorter time and with less than half the water, by using—



McKuen's "PERFECT"
Washing and Boiling Machine.

Colored clothes, fine fabrics and flannels can be cleaned with the same ease in a "Perfect," which can be used in the smallest kitchen on a gas, oil, wood or coal stove, without inconvenience. The 'wear and tear' in washing clothes on a "Perfect" is unnoticeable and the machine is quite easily operated. Send for booklet describing how the "Perfect" works what and it will do! Its price is within the reach of all Also manufacturers of the "Perfect Vacuum Cleaner.

THE PERFECT MFG. CO., Guelph, Ont.

AGENTS WANTED.

We are also manufacturers of the **"PERFECT" Vacuum Cleaner.**

It Pays to Paint Farm Buildings.

The prosperity of the farmer is generally reflected in his farm buildings. These can and should be attractive to the eye. It must be confessed, however, that in most cases barns and outbuildings are a blot on the landscape. This is not as it should be. Paint would right matters. Farm buildings neatly painted are a source of pride to their owner And this extra touch add substantially to the value of the farm.

All agree that buildings look much better when painted. The question we want answered is, "Does it pay?"

It may not pay, directly, to paint our barns. In fact, its preservative effect on ordinary rough siding would scarcely pay for the paint. On new smooth siding it would pay. Indirectly it does pay, however, no matter what the siding. Well painted buildings add to the value of the farm, a sum far in excess of the cost of a coat of paint.

Let us look at it in this way: Consider two communities in close proximity to each other. They are equal in every resuect, save that in one community the buildings are all painted, while in the other they are not. Farms in the former instance will invariably command more money Prospective buyers cannot but be attracted to such a section. The business man knows the value of attractive surroundings.

There are several brands of ready mixed paints on the market which are satisfactory. These should be used by those who have had no experience in mixing paints. Those who plan to mix their own paints should heed the following suggestions: Avoid cheap oil. Use good pale-boiled oil even if it costs a few cents a gallon more. If raw oil is used, dryer must be added.

When we have decided to paint, the question arises, "How shall we apply it?" The ordinary method of hand application is familiar to all. In recent years, the spray pump has been recommended as a cheap and efficient means of painting outbuildings. It proves quite satisfactory. The spray covers the surface well, though somewhat unevenly, and it is necessary to brush it if a good job is desired. This brushing is easily accomplished by means of an ordinary whitewash brush to the side of which a long handle has been attached.

The advantages of the pump as a means of painting are that the paint is applied quickly and cheaply. This practice has its disadvantages in that fully one-half more paint is necessary and one does not get the fine gloss possible when the paint is applied by hand and well rubbed in.

Where a pump is to be used for applying the paint, the cheap, cold water paints are probably preferable on account of waste. For purposes of whitewashing, the pump is always ahead of the brush.

When selecting a color, it is well to remember that red will look well longer than any other shade. A coat of paint every eight or ten years will keep the buildings looking well. —Farm & Dairy.

Hints on Hatching for Back Yard Poultry Keepers.

Love for experimenting prompts one to try one's luck at hatching and rearing chicks; and few hobbies provide so much pleasure for so small an outlay. Having decided upon the breed you intend to keep, do not hatch more chicks than you have convenience for. Some fanciers make a practice of hatching two broods, although they have only accommodation for one lot. They are, they say, then on the safe side if they should be very unfortunate with the hatches, or if the quality out of one be not up to expectations, or if they get a large percentage of cocks.

Never put all the eggs in a special sitting under one hen; put them under two broodies and make up the full sittings with some from your own pen or of a cheaper quality, because if you are unfortunate with one half-sitting you still have the other half to fall back on.

Have the nest in readiness before the hen or eggs, so that you do not have to fit up a makeshift nest in a hurry. A suitable nest can be made in a box 18 in. square with a strip of wood nailed across the front to keep the nest in position inside; or you may make a loose nest in some dark corner or secluded spot, as the hens prefer semi-darkness for their maternal duties. The nest itself should be made of soil, and the centre scooped out, but neither deep nor shallow. The soil should be covered with litter—hay, straw, or chaff—and such a nest should throw off sufficient moisture for shells of average thickness. Place some dummy eggs in the nest and put the hen near at night-time. If she is a stranger the nest will be strange to her, so be patient. She will then, if very broody, glide on the eggs to settle down. Cover her up and leave her for twenty-four hours.

Some people let the broody hen come off the nest at pleasure, but personally I prefer to know when it is off and on. Remove her next day (but night for preference), and substitute for the dummy eggs those you intend her to sit on. See that she is provided with heat-giving food (Indian corn is suitable), and that she comes off daily for about fifteen minutes for exercise, food and water. Sprinkle a little insect powder on both hen and nest, as this will check vermin, which thrive during the hot weather.

The eggs should be tested about the tenth day, and all clear ones removed, instead of wasting the hen's time and energy on eggs that would never hatch. When the time has expired you may reasonably expect some chicks, which should be hatched out dry and strong, be removed in a lined basket near the fire, as the part-hatched and weakly ones will have a better chance. Remove broken shells and feed the hen by herself when the hatch is complete, or she may be off searching for food for the chickens, which they do not require for at least twenty-four hours. Stale bread crumbs and hard-boiled egg chopped fine should be the first meal, after which they can be fed on any previously proved successful system. Feed a little at a time, but often, gradually increasing the quantity of food and the time between meals.—Hidlander, in Poultry, England.

YOUR OPPORTUNITY

for securing a **Right Start** in business life is offered through a course at this reliable, old-established and progressive school. Open all year. Write for prospectus.

The electrically-welded, solid-piece frame gives strength and stiffness to

Peerless Farm and Ornamental Gates

We build Peerless Gates to last a lifetime—handy, convenient and attractive. They remain staunch and rigid through all kinds of rough usage. The frame is made of heavy steel tubing electrically welded into one solid piece. The Peerless Gate, like the Peerless Fence, saves expense because it never needs repairs. We also make poultry, lawn and farm fences of exceptional strength. Write for free book.

THE BANWELL HOXIE WIRE FENCE CO., Ltd., Box K, Hamilton, Ont., Winnipeg, Man.

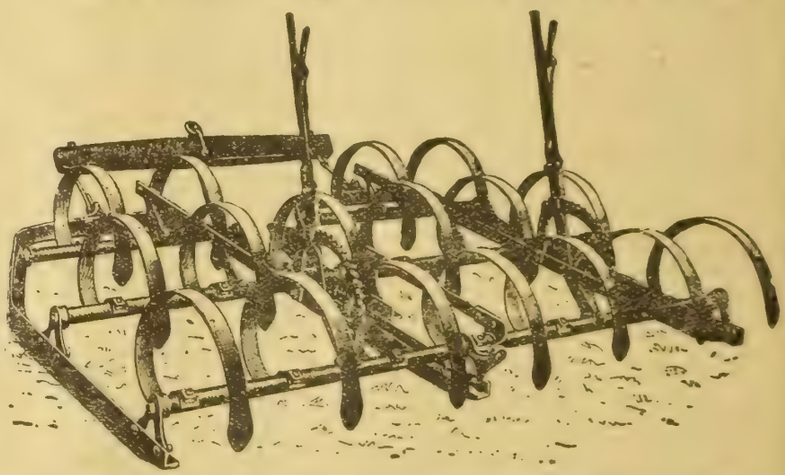
The above cut of the four row sprayer illustrates how one man may quickly and thoroughly spray large fields of potatoes.

This Row Sprayer can be attached to any pump and any style of cart or wagon. No trouble from clogging nozzles.

Manufactured By

R. B. WESTHAVER, Mahone Bay, N. S.

Lever Spring Tooth Harrows



The finest harrow made. Teeth can be adjusted in the field to any depth, and work regulated as required. Saves largely on labor and does more effective work than any harrow on the market. Highly recommended by progressive farmers who have them in use.

This cut shows teeth thrown up for dumping rubbish or for transportation. Made in sizes 11 tooth, one section; 15-tooth, two-section; 17-tooth, two-section; with 1 1-4″ or 1 1-2″ teeth. Made by

Bailey-Underwood Co., Ltd., New Glasgow, N. S.

Concrete Tanks

Not only on the farm, but in the creamery as well, there are indisputable advantages in a water tank which is both easily cleaned and durable. In both these respects, and in many more concrete tanks seem to fill the bill perfectly. A bulletin has been issued as No. 23 by the Association of American Portland Cement Manufacturers of Philadelphia, Pa., which fully describes the uses of concrete tanks and gives full details for their construction. The advantages of concrete for tank construction are summarized as follows in the bulletin:

Materials necessary for construction are easily obtained.

Concrete tanks are easily built.

They can be built anywhere.

They need no repairs.

They will not rot and are practically everlasting.

They do not dry out if left unfilled.

They do not crack owing to extreme changes of temperature.

They will fit any space desired.

They are vermin-proof.

They are sanitary.

They are artistic.

Charlottetown Prices.

GRAIN—Wheat, none sold except imported for seed; oats, 36c to 45c; barley, Island grown for seed, 80c to 09c; buckwheat, Island grown for seed, 70c to 90c.

MISCELLANEOUS—Hay, pressed $10.50 to $11.00; straw, $5.50 to $6.00; wool, 32c cash, 25c trade; beef hides, 9 1-2 to 10c; calf skins, 12c; sheep skins, 90c to $1.25; young pigs, $7.00 to $8.50 pair;

Trade in produce has been quiet and there is not very much farm produce moving

Potatoes are very quiet and shippers are not able to place any quantity and farmers are busy at other work and the low price does not tempt them to haul. We think there is not a large stock of McIntyres held by farmers as they did not keep well, but there is quite a lot of reds, which do not sell well in the local markets.

Hay is firm and demand fairly good. Oats are quiet and very few moving, the farmers are not hauling any and buyers are not able to realize cost for what they have in store and the trade is at a standstill and in the mean time the trade is being supplied with western oats. Eggs are plentiful and prices are working downward but not fast enough to please the buyers. Some Maritime farmers have hay men through the Island buying and buyers have held prices up and complain that they are not able to realize cost on some hay held on hand. Crop conditions are favorable and the planting is well undrweay.

How to Value a Boar.

A subscriber who has been reading the Swineherd and is somewhat confused in reference to reaching the boar's value, asks us regarding the same and whether prizes won determines this question.

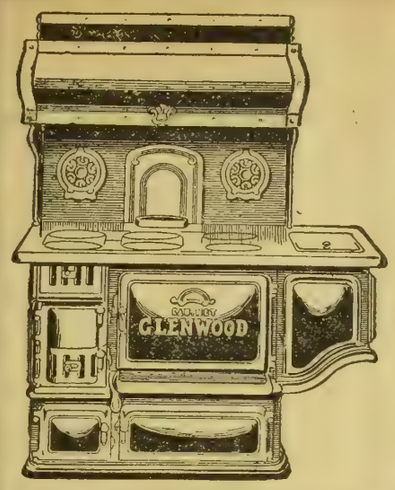
In reply we can say that sometimes boars have been great prize winners yet have been valueless afterwards as breeders. Of course, these are exceptions, for them to fail as breeders. No matter how high they have been sold or how great have been their winnings if they are failures they become discredited. The most valued prize that any boar can win is one that is given him on his production or on boar and get. It is one on which appearance of the boar himself does not count, but it is his work that counts and it is this work that gives him his value. This is the most honorable and most valuable prize that any boar can get, and one that determines his standing among the great boars. A good deal of this also depends upon the enterprise of the breeder in bringing the facts to the knowledge of the public, because value to some extent in great breeding boars is sentiment or opinions formed by the mass of breeders. The breeders and judges and the more convincing you can present their value and the more and valuable breeding work done.

It is dimcult to make a boar very popular until after his get have won prizes or the breeding is pretty generally known to be of show stuff and, therefore, good sellers. And when a hog is able to do this they are pretty certain to find their way to the fairs. has not advertised his good points good points in favor of a boar, the greater is the demand for the breeding of the boar, because it is made public by the enterprise of the breeder in getting the publicity and attention directed to his boar. There may be another boar of equal value but people do not know it, through lack of enterprise of its owner. He

It does not do to take the statement of one breeder in forming your judgment upon what is the best and most valuable animal, but look to the facts that are the basis of the statement. Make an investigation yourself. See what he has done, and whether the things that he has done are really of such importance as to give him the standing that is claimed for him.

Everyone is to a certain extent prejudiced in favor of their own if they believe in them. The most valuable boar is the one that can do the most valuable work and then is made public by his enterprising owner. He is one that is earning the greatest salary for his breeder.—American Swineherd.

The following is recommended for galled shoulders: Take half ounce each of sulphate of zinc, sugar of lead and pulverized alum; put into a quart bottle or self-sealer can; fill with water, shake thoroughly and bathe the sore part with it.



If You Want Your Meals Cooked Right You Must Have a Stove That Will Cook Evenly.

That is just what The Glenwood Ranges will do. The flue strips are evenly divided. The oven damper is sure. The heat is even around your oven and you will have satisfaction. The Glenwood Ranges have been tested and proven what they can do and we guarantee every range we put on the market. If you have not one of our ranges in your district, write some of your friends in St. John and ask them what they think of the Glenwood Ranges and write us and we will send you prices and cuts of our stoves. We make all our Glenwood Ranges in St. John. When you buy one you are booming St. John, and when booming St. John you are helping New Brunswick and the Maritime Provinces in general. Buy a Glenwood Range.

McLEAN-HOLT & CO., 155 Union St., - ST. JOHN, N. B.

AFTER DRUGS FAIL== I'LL CURE YOU.

Go try them all; drugs, dope, patent nostrums and doctor's concoctions, and after you have found by experience that none of them will help you, then come to me and I'll cure you, Nature's way.

I've quit asking people to come to me first; to do so would save them many a dollar and lots of useless suffering, but experience is the best teacher and the only thing that will really convince a skeptical mind.

The time is near when doctors who use drugs will have to abandon that system of treatment for the natural treatment, electricity.

Why, there's Prof. Osler, a world-famed scientist, who said recently that most drugs are worthless.

Dr. Albert Leffingwell, of the American Humane Association, says that the average length of human life would not be diminished by an hour if all the drugs of Christendom were dumped into the sea—barring, perhaps, half a dozen.

How does electricity cure, you ask. By helping Nature. Nature will cure you if she has the power. Electricity is that power. Understand that your machinery is run by electricity. The stomach, heart, liver, kidneys and digestive apparatus are run by electric energy, which is created by the digestion of food in the stomach. Most sickness and chronic disorders can be traced to the failure or breaking down of one of these order. The reason any part fails to do its work is because its supply of electricity is insufficent. Restore that force and pain and sickness will disappear.

Electricity is nerve-food—nerve-life. It makes vigorous men out of weaklings.

I have the only successful method of applying electricity. It has taken me twenty years to perfect my applicance, and I know what I can do.

My Electric Belt is worn while you sleep. Just put it on and turn on the current. There is no shock or burn; the only sensation is a soothing glow.

I have testimonials from people all over the Dominion, who have found health in my treatment. You won't believe these letters, but they are bona fide.

Dear Sir,—I write to le you know that your Belt has cured me, and I am entirely satisfied with your treatment- I gave it to my sister to wear, and she, too, was entirely cured, after being treated by many different doctors, and also being told that she would have to go under an operation, to which she would not consent- She used your belt and was entirely cured.

JOHN W. THIBAULT,
Bruce Mines, Ont.

Dear Sir,—I have worn your Belt for a month, and find that it is doing me great good. My stomach trouble is better, and I also feel stronger in every way. I am well pleased with the Belt.

THOMAS COPELAND,
Lakefield, Que.

Electricity is a lot cheaper than a course of drugging, besides it cures where drugs don't.

Call or send for my free book, read it over and then use your own judgment.

I GIVE IT FREE !

Get my 84-page book describing my treatment, and with illustrations of fully developed men and women, showing how it is applied.

This book tells in plain language many things you want to know and gives a lot of good, wholesome advice for men.

Save Fence Posts

Fence posts are too dear now to be thrown into the ground without any extra preparation. They soon decay and are useless if they receive no treatment of preservative. This decomposition of the post is caused by low forms of life which are technically called fungi. These plants live on the posts and sap the "life" out of them. This allows the moisture to get into the posts which softens the wood for further growth of the fungi. Any preparation which will prevent growth of these fungi will serve as a preservative of the posts. One of the simplest and cheapest of treatments that can be applied is to mix lime with water to the consistency of whitewash. If you can have a place where the solution can be kept hot, so much the better. Dip the part of the post which will be under ground into this, and allow it to remain there for five minutes. If at all possible it would be well to immerse the whole post for the five minutes instead of underground part only. Posts treated like this have been known to be sound after ten years even when the ground was water-soaked.—Canadian Farm.

Canker

Canker in horses is a diseased condition of the foot, much more serious than thrush and although it, like thrush, usually begins in the frog, it soon extends and involves the whole of the sole and sometimes even other parts of the foot.

SYMPTOMS.

The frog bcomes large and spongy and covered with matter of a cheesy appearance and of exceedingly offensive smell. Sometimes the discharge is watery but very abundant and always of a vile odor. This disease is more likely to occur in heavy horses, especially where the feet are large and weak.

A novice should never attempt the treatment of a pronounced case of canker. It is the work of a professional man and even in such hands is often most difficult to manage. It is almost always necessary to cut away the whole sole of the foot and as the result of such an operation necessitates a protracted period of nursing as well as of professional attendance it will be found that in many cases the value of the animal would not warrant the expense incurred and it would prove more profitable to destroy the patient than to treat him.

Milk Thickens When Boiled

A subscriber writes: "Can you tell me why it is that when we boil our Jersey's milk it thickens. She will not be fresh for two months. Is her milk fit for use?"

In milk there is a substance called albumen which resembles the white of an egg and which, like it, coagulates when heated to anywhere near boiling point. It is this that scalds on the tin if the first water used in washing dairy utensils be hot. For this reason we always advise rinsing milk pails, etc., with warm water before washing them with hot water.

In normal milk the percentage of albumen is so small (only about three-fourths of a pound to 100 pounds of milk) that it will not, if sweet, coagulate. However, colostrum, or the milk of a cow just after she freshens, contains a very high per centage of albumen, often twelve to fifteen per cent. Such milk will readily thicken when heated on account of this percentage of albumen. Cheese and butter makers often take advantage of this fact to test milk, where they suspect a patron of sending the milk of a new milch cow too soon.

The reader will readily understand that where a cow continues to milk too close to her time of again freshening, her milk may reach the stage where it contains such a high percentage of albumen that it will thicken when boiled. In such cases it is best to put a cow dry as early as possible. Furthermore, a cow is better of this short rest to enable her to recuperate for her next milking period.

Beware Imitations.

Ruberoid Roofing

(TRADE MARK REGISTERED.)

You have no roof troubles when your house is covered with RUBEROID Roofing, which is weather-proof, sun-proof and fire-resisting.

RUBEROID Roofing resists sudden changes from hot to cold—the kind of changes that cause other roofs to crack and warp.

There are more than 300 imitations of RUBEROID, which is an evidence of its merits. Inferior articles are never imitated.

You can always identify it by the picture of the RUBEROID man on the outside of the roll and the word "RUBEROID" stamped on every few feet on the underside of the material.

RUBEROID costs less to maintain than shingles, tin, slate or any other ordinary roofing.

FREE ROOFING BOOK.

For your name and address we will mail you an instructive book on roofing—"All About Roofing."

Ask your dealer to show you a sample of the "17-year-old" RUBEROID roof. This sample was cut from a roof laid in 1892, and exposed to the weather for 17 years. If your dealer does not happen to have a sample, write to us direct and we will send you one by mail.

To Prevent Growth of Horns

For several years caustic potash has been used throughout Canada to prevent calves from growing horns. The following method has been very successful:—

The caustic potash should be applied as soon as the "button-like" horns can be felt, after the calf is three days old. If postponed the operation may give unsatisfactory results. To apply the potash, the hair is removed from about the horns close to the skin. The potash is moistened slightly and rubbed over the skin which covers the points of the horns until the skin is white.

It is not necessary to rub the skin until blood comes, as this will cause unnecessary soreness. One such treatment is usually sufficient to prevent the growth of the horns.

The following precautions should be taken: The caustic should be wrapped in heavy paper to protect the hands of the operator; the caustic should not be moistened too much, so that the liquid will run down the side of the calf's head, for this will cause unnecessary pain; the calf must be securely fastened so that the head may be held still to avoid applying the caustic anywhere except over the horns. One stick of caustic potash, if preserved in a tightly-corked bottle, will serve to dehorn many calves.

Midsummer Agricultural Meetings.

It is proposed by the Commissioner for Agriculture for New Brunswick to have speakers in attendance at the following places on the dates mentioned to give demonstrations and lead discussions at afternoon meetings and to address evening meetings. The subjects to be taken up are Soil Cultivation, The Judg-

OUR DIAMOND JUBILEE YEAR

PAQUET GUARANTEED CLOTHES

Made to Your Measure, But NOT Custom Made

THIS looks paradoxical, but it's none the less true for all that. What's more, we can prove it to your entire satisfaction, and stand ready to refund your money, if you are not ABSOLUTELY SATISFIED with your Clothes when they arrive.

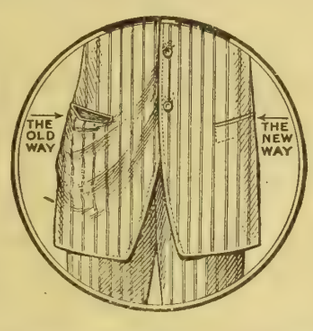
PAQUET Guaranteed CLOTHES, as their name implies, are GUARANTEED to fit you perfectly. All Ready Made Clothes are cut and made up to fit AVERAGE types, not REAL men. That's why they don't fit YOU. And they can't be MADE to fit, either, without being all ripped up and recut—a very expensive undertaking, and, therefore, out of the question.

PAQUET Guaranteed CLOTHES are cut to fit BEFORE they are made up at all. That's why we can GUARANTEE them to fit PERFECTLY. Our new style book tells all about our method of Clothes making. PAQUET Guaranteed CLOTHES are GUARANTEED to be the best value in Canada to-day at from $10.00 to $14.25—worth $13.50 to $20.00.

The Suit Illustrated

is made from absolutely PURE WOOL, navy or black serge, best Indigo Dye, thoroughly shrunk and absolutely guaranteed to keep its color. The workmanship is unexcelled in this country. The real value is $13.50. Our special price, PREPAID, to any part of Canada..... $10.00

Sizes 36 to 44 only. Larger sizes 75c per size extra.



The Suit Illustrated

The Famous "BARTELL PATENT" Pockets

are used in all our garments. This is a feature well worth considering. BARTELL PATENT Pockets will not sag nor gap and will retain their shape permanently. This feature not only greatly improves the appearance but adds to the life of any garment. BARTELL PATENT Pockets are to be found only in the highest grade Clothes, which is one of our reasons for adopting them for use in the making of PAQUET Guaranteed CLOTHES.

ing of Horses and the Judging of Dairy Cattle. Each meeting will be placed in charge of the Agricultural Society of the District and it is suggested that a picnic meeting be arranged so that those in attendance may get their suppers on the ground and then be on hand for the evening meeting.

A small piece of land, about a quarter of an acre, which will have been plowed and harrowed, will be used to demonstrate cultivation and horses and dairy cattle will be brought in for judging. Men of long practical experience and expert knowledge will conduct these meetings:

Tuesday, June 14—Andover.
Wednesday, June 15—Glassville.
Thursday, June 16—Centreville.
Friday, June 17—Debec.
Saturday, June 18—Harvey.
Monday, June 20—Hoyt Station.
Tuesday, June 21—Armstrong's Cor.
Wednesday, June 22—Greenwich.
Thursday, June 23—Queenstown.
Friday, June 24—Kingston.
Saturday, June 25—Sussex.
Monday, June 27—Elgin.
Tuesday, June 28—Havelock.
Wednesday, June 29—Hillsboro.
Thursday, June 30—St. Anselme.
Friday, July 1—Sackville.
Saturday, July 2—Shediac.
Monday, July 4—Buctouche.
Tuesday, July 5—Rexton.
Wednesday, July 6—St. Louis.
Thursday, July 7—Fords Mills.
Friday, July 8—Napan.
Saturday, July 9—Bathurst.
Monday, July 11—Balmoral.
Tuesday, July 12—Doaktown.
Wednesday, July 13—Stanley.
Thursday, July 14—Bear Island.
Friday, July 15—Campbell Sett.

The above list is not final but any changes will be announced.

Keep these dates in mind and do your utmost to make the meetings held in your vicinity a decided success. Bring your boys and girls and together work for the advancement of agriculture in your locality.

To further the interest in this work the Department is asking that the members of the Agricultural Societies and their friends, accompanied by their wives and children bring lunch baskets and have a social lunch together on the grounds after the demonstrations are completed and thus occupy the time until the evening meetings are held.

267 Eggs in 365 Days

is the wonderful and unbroken record made by the Barred Plymouth Rock Hen,

Columbia

who was the foundation of the greatest Egg-producing and Prize-winning strain of Plymouth Rocks in the world to-day. Weight of females, 7 to 10 pounds; males from 8 to 11 pounds. Eggs for hatching for sale every month in the year and a few choice breeding birds on hand now, as we are practically done hatching this season.

For prices and photos apply to the Originator and Breeder of this wonderful strain of fowl. Satisfaction guaranteed.

Card of Thanks and that Kind of Thing.

Bloomfield Farm.

The undersigned beg to thank their friends for their very liberal patronage in the past which we trust has been mutually satisfactory and at the same time to say that we are still in the "running" at the old stand, with Ayrshires, Guernseys, Shropshires, etc. etc. Our specialties just now in stock for sale are 4 Ayrshire bulls, ranging in ages from 8 months to 18 months, purebred and registered. 1 Guernsey cow 6 years with calf at her foot, two days old. Heifer, this cow is a very superior one in every way and of the higheat registry in the Dominion. Also 20 Shropshire lambs, pure bred season 1910 and fine ones. Likewise, 4 pure bred Coolie puppies 4 weeks old. Would be pleased to hear from prospective buyers whose requests will have our prompt and best attention.

John McDonald & Son,
Bloomfield Farm. - Shubenacadie, N. S.

Shorthorns For Sale.

One pure bred bull 8 months old. one pure bred heifer 8 months old, one pure bred heifer 2½ years oldt one pure bred cow 4 years old. The first two are sired by Emma's Fashion. The last two are in calf by Emma's Fashion. Apply to

CHAS. B TAIT,
Oxford, N. S.

Chester Whites.

I am now booking orders for some choice Chester White Pigs, both sexes. Can furnish pairs not akin.

Correspondence solicited.

WM. ERB, - Sussex, N. B.

Kyle's Rhode Island Reds.

Buy your Rhode Island Red Eggs for hatching from me. My Reds are imported from the United States and were winners at Sussex Halifax, Fredericton and Amherst Winter Fair in 1909. Prices on application.

Thomas S. Kyle,
Sussex Corner, New Brunswick

Maple Grove Ayrshires

I have for immediate sale several young Bulls fit for service, many of them prize winners at the recent exhibitions. Correspondence solicited. Prices reasonable.

M. H. Parlee, Lower Millstream, N. B.

GLENVIEW FARM.

Guernseys, Jerseys and Poultry

We are offering one yearling Jersey Bull and Calves of both sexes, Guernsey Bull Calves, under 6 months of age. Eggs for hatching from the following birds: Barred Plymouth Rocks, White and Buff Wyandottes, S C. Brown Leghorns and S. C. Rhode Island Reds. Send for Poultry Catalogue.

WALTER McMONAGLE & SONS,
Long Distance 'Phone. Sussex, N B

For Sale.

Ayrshire Bull Calf "Hill Grove Matchless" (30207) a promising young bull of good dairy type, his dam is a fine large cow a prize winner and a heavy producer. Also a few splendid heifer calves of last August and September. For particulars, write

JAMES BARRETT,
Hill Grove Farm,
Crouchville, St. John, N. B.

The PUBLISHER'S DESK.

A Book Worth Reading Twice.—Books issued as an advertisement are often handsome and sometimes interesting. Rarely, though, are they both at once in any such degree as is the latest product of The Pedlar People of Oshawa, those "advertisers in plain English" with whose straight talks most of our readers are familiar. This progressive house has just issued a new edition of their famous booklet "Roofing Right", which is elaborately illustrated from actual photographs of farm buildings in all parts of the Dominion that have been roofed with Oshawa Shingles to the satisfaction of their owners and occupants. The new "Roofing Right" contains forty-eight pages, magazine size, and is as complete a treatise on the merits and faults of all kinds of roofing materials as has probably ever been put between covers. When one has read it through there is little left to guess at on the question of roofing. The book is written in a frank, plain spoken way and must prove valuable to anyone interested in the choice of roofing for any building. We learn that the Pedlar People have a few copies remaining of the large edition recently printed, and we suggest to our readers the wisdom of applying at once for this valuable work, which is sent free and postpaid on request to any subscriber of this paper who mentions it when making his request. When writing ask for Booklet No. 17.

The Kawartha Lakes.— When Samuel de Champlain was leading the Hurons through the beautiful Kawartha Lakes he fancied the butternuts and other low trees were orchards set out by the hand of man, so picturesque and charming were the shore-trees laced and laden with running grapevines. And to this day, through the farmer has made his home in the "Highlands" and the picturesque war canoe of the Indian is gone from these waters, the shadowy shores of Wawartha Lakes are still beautiful to behold. Owing to the high altitude of these lakes, nearly 1,000 feet above the sea level, the air is pure, and laden with health-giving and soothing balsamic odors from the pine and spruce-clad hills—it renews physical vigor, restores the nervous system, invigorates the mental faculties, and gives a new lease of life. To those who suffer from hay fever, the Kawartha Lakes are a haven of heaven-given relief and security. Easy of access (three hours from Toronto by the Grand Trunk Railway), profuse in its gifts, and diverse in its attractions, having its fashionable resorts, and its delightful facilities for "roughing it." Why not throw business to the janitor for a month, cast care to the dogs? and when you return from the "Bright Waters and Happy Lands" (the English rendering of the Indian word "Kawartha") you will be a new creature, fortified for another year's trials.

BEE-KEEPING PAYS

best under modern methods. Large profits from small investments. Any one can learn and get fair crops of honey first season. Books of instruction, Bees, Queens, hives, sections and comb foundation at lowest prices. Price list free. E. L. COLPITTS, Box 10, Petitcodiac, N. B.

Homestead Farm

Has one of Canada's leading Holstein Herds. Have won more prize money in the last five years than all other Maritime Holstein herds combined. Have more officially tested cows than any other herd in the Maritime Provinces and more high records. 6 cows over 20 lbs. butter in one week and some of those close to 24 lbs. Our champion cow at the Winter Fair has no official record while the fourth prize cow has a 23 lb. record.

We have a lot of young stuff to sell of the very best breeding. You can't afford to miss this. A few cows cheap. We also offer a few ewes (not bred) lambs of 1909.

Our Clydesdales are in splendid shape, and we can part with the two foals of '09.

No. 1 Stallion.—Dam, Soubrette, Imp., by Labori, champion at Halifax, 1909; 1st prize 1908. No. 2 Filly—Dam, Pink Rose, Imp., by Up to Time, 2nd at Halifax 1908; 3rd, 1909. Both are sired by Handy Andy, Imported by Marmion out of a Baron's Pride mare. Write or come and see us.

LOGAN BROTHERS, - - Amherst Point, N S.

BELLEVUE STOCK FARM.

Ayrshire and Shorthorn Cattle.

Bellevue won female championship and all of the herd prizes in Shorthorns, with every animal our own breeding. In Ayrshires we have held the male championship for two years. Write for prices or call and see us. We breed our winners and sell them too.

C. A. ARCHIBALD, Proprietor, - - TRURO, N. S.

AYRSHIRE CATTLE, YORKSHIRE AND BERKSHIRE PIGS.

We have for immediate delivery some choice, young, pure bred Berkshire and Yorkshire Pigs. Also have some fine Ayrshire pure bred stock.

These all are of exceptionally high goods. Prices reasonable. Correspondence solicited.

THE S. H. WHITE CO., LTD., - - Forest Glen, N. B.

Cobequid Farm Holsteins For Sale.

Two bulls fit for service from record of merit dams. Three heifers two heifers two years old, and two heifers one year old, bred to Hellon Dekol's Prince. Three young cows, bred to Sir Rooker Posch Artis. Several bull calves from three to six months old. Come and see them.

SAMUEL DICKIE - - - Central Onslow, N S.

SHORTHORN BULLS FOR SALE.

I have, for immediate sale, eight very nice Durham Bulls, from two to fifteen months old. They were sired by a bull imported from Hon. John Dryden & Sons and are out of excellent cows. Write us your needs. We can supply them and will give you good satisfaction

Why and When to Underdrain.

By F. L. Fuller, Truro, N. S.

IN view of the preceding articles on this subject, a few words relative to the kinds of soil which should be drained and the reasons why may not be amiss. Furthermore, lest some readers may be carried away with the prospects of profits as set forth in the preceding records and, without due consideration, be led into an extravagant and unprofitable system of drainage, we may add some of our own experiences and urge readers to carefully consider the matter before making large expenditures.

As the kinds of soil that need draining and the reasons for the same cannot be discussed separately we will state some of the reasons and then apply them to our existing conditions.

1. It deepens the soil in which plant roots grow.
2. It allows air and heat to enter the soil.
3. It enables manure to act more beneficially.
4. It lengthens the season.
5. It permits of tillage operations being done more easily.
6. It enables plants to resist drought.
7. It prevents washing and consequently, increases production, which is the most important of all.

Water is the most important factor in plant growth. It is the vehicle which carries all food from the soil to the plant. An eminent agriculturist has said that if he could control the supply of moisture he would have solved the greatest problem of plant growth.

Take for example any of our farm seeds. The three essentials necessary to start a plant are: moisture, air and heat. In a soil completely saturated with water we can have no air, and consequently cannot even begin to grow a plant. As air and consequently heat are admitted to the soil when the free water is withdrawn, it is, therefore, evident that the most important essential to plant growth is within man's control. Furthermore, the extent to which this moisture can be controlled at a cost below the value of the increase of crop caused thereby is the measure of man's success in underdraining.

Scientists tell us that water occurs in the soil in three forms, viz., free water,—that which appears when a hole is made in the ground; film or capillary water,— that which may be compared to what is held by a sponge, and hygroscopic water,—that which cannot be separated from the soil particles except by artificial heat. Of these, only two kinds are of much practical importance to the farmer—free water and film water. I shall endeavor to point out the necessity of getting rid of free water to a depth of about three feet, and retaining all the film water possible above that depth. For accomplishing this two-fold object, underdraining is the most important and practical means.

It may be well to consider here for a few moments the source of supply and demand of moisture in agriculture. It is a well-known fact that all farm crops use much more water than that which falls on the surface during an average growing season. In 1905 experiments were conducted at the Ontario Agricultural College, Guelph, by planting wheat, oats and barley in crocks set in the earth in such a manner as to catch all the rainfall. Water was added when the plants showed signs of wilting, and the result was that during the time the wheat was maturing, 10½ inches of rain fell, and 12 inches of water had to be added. While the oats were maturing, 8 inches of rain fell and 13¼ inches were added. While the barley was growing, 8 inches of rain fell, and 10½ inches were added. Thus we see that these crops, during the period of their growth, used approximately two and one-quarter (2¼) times as much water as fell in rain. It is stated that the plants did not grow as large and strong as those under actual field conditions. We are, therefore, safe in assuming that field crops used as much, or even more, than those in the experiment. Therefore it is evident that if we are going to grow crops successfully, we must handle our soil in such a manner as to retain a large amount of the spring and autumn rainfall. The season of 1905 was a very dry one in Ontario, therefore the same experiment was tried in 1906, which proved a very wet season. The result was that, although moisture was much more abundant, the plants did not use nearly as much as during the dry season. This, we presume, was due to the fact that there was much less evaporation through the leaves. This experiment also went to show that in a wet season a large amount of water was carried away by drainage.

It is a well known fact that excessive water standing in the soil for 48 hours or more is very injurious to plant life. We, therefore, see that, in addition to being compelled to retain a large proportion of the spring and fall rains, we have to make provision to get rid of the surplus quickly. For combining these conditions, underdraining is the great remedy and for some soils, at least, is the only remedy.

It is a matter of common knowledge that soils which do not suffer from excessive rains also resist drought well, the reason being that the soil is of such a nature as to retain large quantities of water and has good natural drainage. If we study the condition of these fields, we find that they are composed of a comparatively loose soil in which the particles are neither too fine or too coarse. Take, for example, two tubes and place exactly the same quantity of soil in each, making the soil as compact as possible in one and leaving it loose in the other. Add water carefully to these until the soil is completely saturated, when you will find that the tube with the loose soil contains 35 per cent. more water than the tube with the compact soil. It will also be observed that any surplus water added will drain away much more quickly from loose than from compact earth. In many of our fields these conditions can be obtained by a proper method of cultivation. For our fine clay soils, however, underdraining is the only remedy. These soils hold water so tenaciously during our cold spring weather, and are so seriously injured by working when too wet that the only time when they could be improved by cultivation is during the time when they must be growing crops if they are going to yield any return. These soils also suffer severely from drought for when the weather becomes hot and dry they lose water rapidly by evaporation. As they lose water they shrink, causing numberless cracks or fissures to form on the surface. These fissures admit air and increase evaporation, themselves becoming large and deep, breaking the roots of plants, which, owing to unfavorable conditions, were compelled to stay near the surface, and exposing them directly to the air thus destroying all possibility of a profitable crop. From these soils underdrains take off the surplus water and permit seeding to be done several weeks earlier, an important consideration when a short season is one of our chief obstacles. Thus, when the hot weather comes we have a crop growing which shades the ground and, to a large extent, prevents rapid evaporation. Furthermore, as the excessive water is withdrawn the air penetrates and warms the soil. The air and heat assists nitrification and decomposition and liberates plant food. The roots of plants go after food and get a firmer hold on the ground and withstand drought much better. Moreover, as these rootlets die they leave small capillaries in the soil which absorb and retain the rainfall that formerly ran away and was wasted. Thus, in a few years after underdraining, the entire nature of the soil is changed. You cannot only cultivate it much earlier, but there is not the same danger of working it when slightly wet.

Another great advantage of carrying off surplus water by underdraining is that it removes the necessity of its being evaporated and consequently, saves a vast amount of heat. The reason why wet soils are called cold is due to the heat lost by evaporation. It takes as much heat to raise a pound of water one degree as it does to raise a pound of dry sand ten degrees. Again, it takes 5½ times as much heat to evaporate a given quantity of water as it does to heat the same quanity from the freezing to the boiling point. When it is considered that the amount of water lost by evaporation from a reservoir in 24 hours has equalled 140 barrels per acre, we get some idea of the great amount of heat lost in this process.

There are various other advantages connected with underdrainage that space does not permit me to mention. There are, however, other conditions where underdraining is necessary that I must mention before closing. Oftentimes portions of fields which in themselves would not require draining are rendered unfit for cultivation by having water from an adjoining fiefd perculate through them, thus making it impossible to cultivate the field, as a whole, until this portion has become dry. The greatest possible benefits to be derived from underdraining are to be obtained from such instances. Drainage in such cases differ from draining clay fields inasmuch as there is no rule by which you can calculate the number of drains required. My advice would be to put in a few drains and then watch the result. On the College Farm there is a field which gently slopes toward the centre, a wide portion of the lower part of which continues wet from such a source. This portion was drained, and I have since become convinced that a lesser number of drains would have accomplished the purpose. In other instances we find whole fields that are kept damp by water oozing from adjoining fields. In such cases one drain, and sometimes an open ditch, will relieve the difficulty. Sometimes springs will keep a large portion of a field wet. In such instances great care should be taken to get at the source, as it often happens that the portion affected is quite a distance from the seat of the trouble Finally, there are swamp lands which usually require pretty thorough draining and furnish our most productive fields when properly handled.

Drainage practice must be adapted to each tract of land to be improved. In other words, each farm, and in many cases each field, pre-

sents a special problem.

In conclusion, I would say that, if you contemplate improving your farm in this manner carefully consider the reasons why your fields need draining. Do not underdrain a field, however much it may require it, unless yod intend to cultivate it intelligently afterwards, and do not hesitate to drain a field to which you devote your best efforts and which, for any of the reasons here mentioned, frequently fails to give you satisfactory returns.—F. L. Fuller in 1909 Report of the Nova Scotia Department of Agriculture.

Fruit Crop Report.

APPLES.

Apple trees everywhere have had an abundance of blossoms. Judging from the heavy bloom that is reported on nearly all varieties, the present indications are for a large crop of apples.

District 1.—The bloom is showing for a good crop, in both early and late varieties. The early varieties, particularly were loaded with bloom, and are now well 'set.' Of the winter varieties, the Greenings are especially promising.

District 2.—The prospect is for a moderate to good crop. The early and fall varieties have blossomed heavily. Of the winter varieties, the Greenings for the most part are well loaded with bloom. Baldwins and Spies are showing a good bloom also. In some cases, varieties that bore heavily last year have a light bloom.

District 3.—There has been a very heavy bloom in the large winter apple section along the north shore of Lake Ontario. The present indications are for a full crop of nearly all the leading commercial varieties. In the counties of Northumberland, Durham and Prince Edward the outlook at the time of blossoming is the most promising for several years

In the Georgian Bay District there is every indication of a fair crop of apples. Some varieties have blossomed very heavily. Spies and Baldwins, which bore heavily last year, are not showing such a plentiful bloom.

District 4.—The bloom is very heavy in the Ottawa and St. Lawrence valleys. There is also a heavy bloom in District 4 of Quebec. The Fameuse, the leading commercial variety of this section, at present promises to be somewhat heavier than last year.

Districts 5 and 7 are not far enough advanced to form an estimate of the crop.

District 6.—Present indications are for a moderate to good crop of apples. There was a severe frost in the Annapolis valley at the end of April, which injured the fruit buds in some localities. Although the effects of the frost are not considered serious generally, the bloom is reported considerably shortened in some parts of the valley.

District 8.—The prospects for the apple crop are good in Prince Edward Island. The blossoms have just opened and the trees are full of bloom.

Districts 9 and 10.—Apples have set well in British Columbia, and at present a full crop is looked for.

PEARS.

Pears have blossomed heavily everywhere.
